1. A control system for a large electric power steam turbine having a plurality of turbine sections to which steam is supplied through at least one throttle valve and a plurality of governor valves, said control system comprising means for electrohydraulically controlling the position of the throttle and governor valves in response to setpoint signals and signals representative of the valve positions, means for generating signals representative of the turbine speed and the turbine impulse pressure, means for generating signals representing a valve setpoint for application to said electrohydraulic position controlling means to position the value for load control after synchronization in response to a load reference in a load control loop, means for normally generating a speed corrected load reference as a function of the speed signal and the load reference, means for generating an impulse pressure load reference as a function of the impulse pressure signal and a setpoint derived from the speed corrected load reference, means for connecting and disconnecting said inpulse pressure reference generating means in the load control loop, means for setting the load reference to a post-connection value or a post-disconnection value which enable the valve setpoint to have the same value just before and just after a connecting or disconnecting action by said connecting and disconnecting means, and means for setting the impulse pressure reference and the impulse pressure setpoint to respective values which enable the valve setpoint to have the same value just before and just after a connecting action by said connecting and disconnecting means.

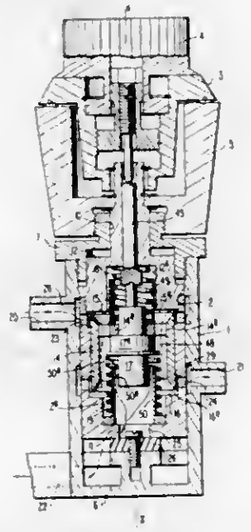
THERMOSTATIC MIXER VALVE

Bernard Dauga, Selchamps, France, assignor to Pont-A-Mousson S.A., Nancy, France

Filed Dec. 19, 1975, Ser. No. 642,633
Claims priority, application France, Dec. 20, 1974, 74.42270
Int. Cl.² G05D *11/16, 23/13*
U.S. Cl. 236—12 R **7 Claims**

1. In a thermostatic mixer valve for mixing hot and cold water, said valve including a cylindrical valve body, a cylindrical cartridge slidably mounted in said body, said body and said cartridge each having axially spaced, circumferentially aligned hot water and cold water inlets, a mixed water outlet, an axial flow passage within said cylindrical cartridge leading to said mixed water outlet, a flow rate regulation control member supported by the body for axially shifting said cartridge between two positions in one of which communication between

the mixed water outlet of the cartridge and body is prevented, a temperature regulation control member supported by said body, a temperature regulating means including a thermosensitive element connected to said temperature regulation control member for regulating the mixed water temperature by varying the relative proportions of hot and cold water in the mixture, said cartridge defining an annular mixing chamber into which the hot and cold water inlets open radially, said temperature regulating means further comprising a slide valve secured to the thermostatic element and positioned within said mixing chamber, said cartridge further defining axially spaced abutment surfaces facing respective ends of said slide valve and cooperating with the ends of said slide valve to define a cold water passage and a hot water passage respectively leading from said cold and hot water inlets to the inter-



ior of said slide valve, the interior of said slide valve being open and forming said axial passage leading to said mixed water outlet of said cartridge, a pair of coil springs acting on opposite sides of said thermostatic element, the improvement comprising: annular, hollow deflectors located within respective ends of said mixing chamber, radially opposite said radial hot water and cold water inlets and radially spaced from said slide valve forming annular flow path therewith and extending axially beyond the ends of said hot and cold water inlets and being axially spaced relative to each other so as to deflect the radial inlet flows of the hot and cold water to axial flows so as to flow towards each other prior to flowing radially between said deflectors via a radial passage therebetween and finally through the center of the mixing chamber within said axial flow passage leading to said mixed water outlet for said cartridge.

4,029,257

THERMALLY ACTUATED VALVE

Patrick A. Jenkins, and Ronald E. Reinke, both of Decatur, Ill., assignors to Borg-Warner Corporation, Chicago, Ill.

Filed Oct. 8, 1975, Ser. No. 620,625

Int. Cl.² F16K *31/56;* **G05D** *23/10*

U.S. Cl. 236—48 R **6 Claims**

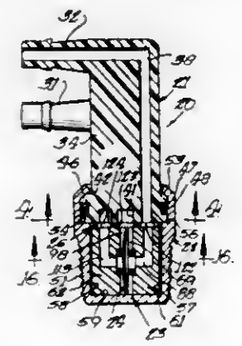
1. A thermally actuated valve comprising:

a cup member including a pocket defining a bottom wall and a side wall having an annular shoulder spaced from said bottom wall, said cup member being adapted for contact with a heat source;

a thermally conductive cartridge received within said pocket having a bottom surface engaging said bottom wall of said pocket, said cartridge including a centrally disposed common channel communicable with a pair of secondary channels disposed on opposite sides of said common channel, each of said common and secondary channels opening through an upper surface of said cartridge;

a thermally responsive bimetal snap action valve member disposed in said common channel having a portion movable from sealing engagement with one of said secondary channels into sealing engagement with the other of said secondary channels for controlling communication between said common channel and said secondary channels in accordance with temperature change in said cartridge;

a resilient gasket disposed in said pocket overlying said upper surface of said cartridge including a pattern of openings communicating with said common and secondary channels;



a crown member including a common passage and a pair of secondary passages opening through a lower surface thereof communicating with said pattern of openings in said gasket, said lower surface having portions engaging said gasket and said annular shoulder of said cup member; and

means securing said crown member to said cup member whereby said gasket is compressed between said upper surface of said cartridge and said lower surface of said crown members for resiliently urging said cartridge into heat transfer engagement with said bottom wall of said cup member while maintaining a seal around said channel and passage openings.

4,029,258

SOLAR ENERGY COLLECTOR

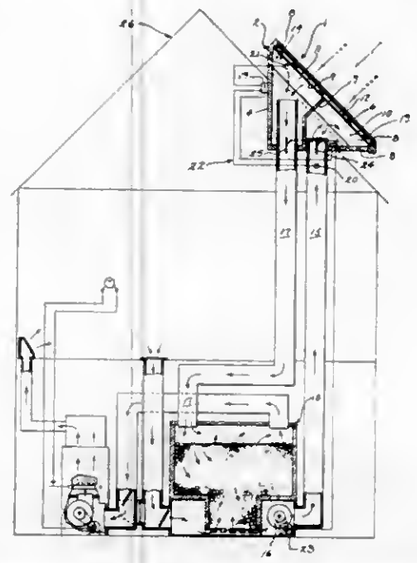
Glenn F. Groth, Sheboygan, Wis., assignor to Sun Unlimited Research Corporation, Sheboygan, Wis.

Filed Nov. 14, 1975, Ser. No. 631,938

Int. Cl.² F24D *0/00*

U.S. Cl. 237—1 A **10 Claims**

1. A solar energy collector system comprising a flat-plate collector unit having an air inlet and an air outlet, means for removing heat from air, and means to circulate air from said heat removal means to said collector inlet and from said collector outlet to said heat removal means; said collector unit comprising a heat insulated housing having a transparent face exposed to the rays of the sun, a flat-plate collector spaced from said transparent face in said housing and extending to the sidewalls of said housing, a partition in said housing supporting the back of said flat-plate collector and dividing the portion of said housing behind the flat-plate collector into separate inlet and outlet chambers connected respectively to said air inlet and air outlet, and passage means for the flow of air from said inlet chamber into and upwardly through the space between said transparent face and said flat-plate collector to said outlet chamber, a substantial part of the back side of said



collector plate being exposed directly to the air in said chambers.

4,029,259

ARRANGEMENT FOR WASHING TRANSPARENT PARTS OF VEHICLES

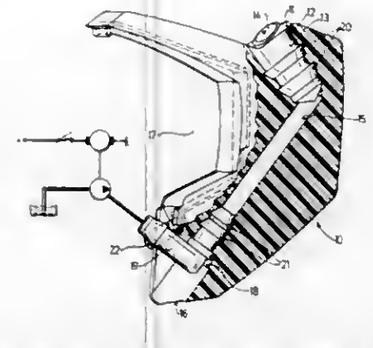
Eckhard Ursel, Buhl, and Peter Kessler, Buhlertal, both of Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany

Filed Jan. 22, 1976, Ser. No. 651,393

Claims priority, application Germany, Jan. 30, 1975, 2503730

Int. Cl.² B60S *1/46*

U.S. Cl. 239—284 A **18 Claims**



1. In a vehicle, an arrangement for washing lens shields of vehicle lamps, comprising a bumper having a bumper guard, said guard having a portin of solid cross-section; supply means for washing liquid; a spray nozzle means mounted on said bumper guard of the vehicle so as to face towards the lens shield; a channel passage extending through said solid portion of the bumper guard and connecting said liquid supply means with said nozzle means; and means for propelling said liquid towards said nozzle means.

4,029,260

CLEANING AND SANITIZING APPARATUS

George A. Herrick, Rte. 1, Box 297, Waskom, Tex. 75692

Filed Oct. 2, 1975, Ser. No. 619,040

Int. Cl.² B05B *15/06;* **B08B** *7/30;* **B05B** *3/08*

U.S. Cl. 239—282 **5 Claims**

1. A portable, water operated cleaning and sanitizing apparatus removably secured to a mounting board comprising:

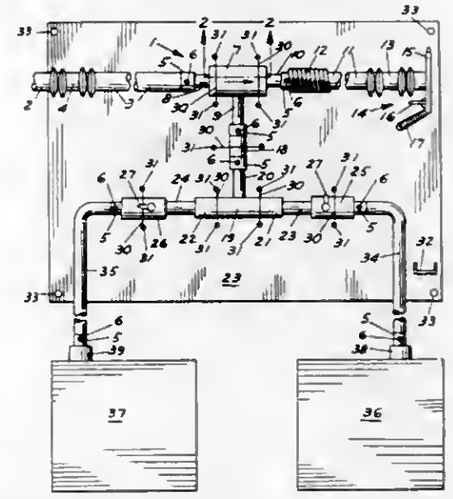
a. a mixing valve having an inlet fitting, an outlet fitting and a first tee fitting and including a ball check means;

b. an inlet hose having one end removably fitted to said inlet fitting and the opposite end to the faucet of a conventional water supply system;

c. an outlet hose having one end removably fitted to said outlet fitting;

d. a second tee fitting having a first tee leg nipple, a second tee leg nipple and a tee discharge;

e. a chemical inlet hose connecting said first tee fitting and said tee discharge of said second tee fitting;



f. at least one chemical hose having one end removably fitted to said first tee leg nipple of said second tee fitting, and having the opposite end connected to at least one chemical reservoir;

g. at least one valve in cooperation with said at least one chemical hose between said chemical reservoir and said second tee fitting to control the flow of chemical through said chemical hose and said chemical inlet hose to said mixing valve; and

h. a spray nozzle in cooperation with the opposite end of said outlet hose.

4,029,261

PISTON DISPLACEMENT LIQUID SPRAY PUMPS

Jaime Olegnowicz, Aguilar y Seljas No. 50-502, Mexico, D.F., Mexico (10)

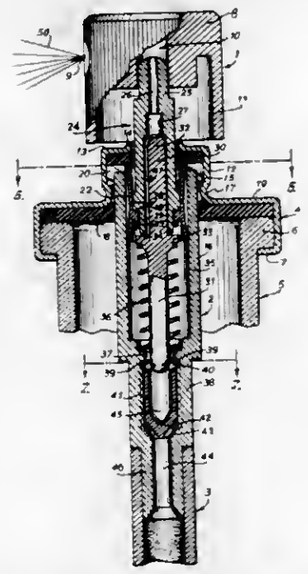
Filed Apr. 30, 1976, Ser. No. 681,919

Int. Cl.² B05B *11/02*

U.S. Cl. 239—333 **6 Claims**

1. A piston displacement liquid spray pump comprising in combination a container; a pump supporting ferrule engaged on the neck of said container; a hollow cylindrical housing having an upper end provided with an outwardly extending lip, the lower edge of said lip being supported on said ferrule and its upper edge pressing a packing washer against the cover portion of said ferrule, at least one outwardly directed radial slit being provided through said lip of the housing whereby venting of the said container is permitted through said at least one slit to the atmosphere; a stem within said housing; a hollow stem extension telescopically engaged outwardly of the upper section of said stem; an actuator engaging the upper end of said stem extension and capable of biasing the same and said stem downwardly, said actuator being provided with an outlet passage and nozzle in communication with the bore of said hollow stem extension; a check valve comprising a valve chamber, a valve seat at the lower end of said valve chamber, and a bullet-shaped hollow floating valve member cooperating with said valve seat and within which the lower end of said stem is received on its downward movement; a longitudinal groove along the upper section of said stem and forming a passage with the complementary bore of said hollow stem extension communicating the interior of said housing with said

nozzle; a piston slidably movable within said housing and forming therewith a pumping chamber and a venting chamber, said piston being mounted on the lower end of said hollow stem extension with a longitudinal lost motion engagement thereto; an outwardly directed annular flange on the middle portion of said stem; the lower end of said stem extension being spaced from the upper surface of said annular flange so as to form a span communicating said groove with said pump-



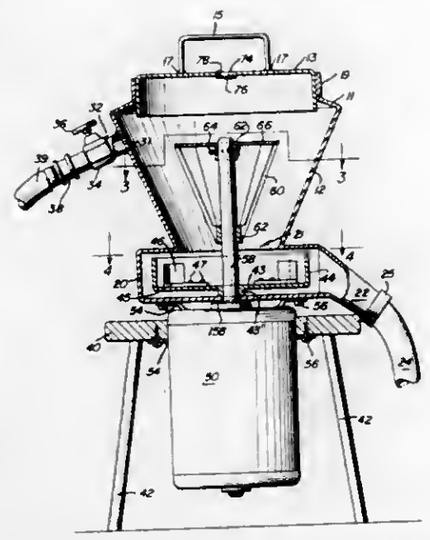
ing chamber; said lost motion engagement of the piston enabling said piston to fully obstruct said span during its upward or charging stroke and to clear the same during its downward or pumping stroke; said piston when the stem is at its uppermost position, being capable of firmly bearing against the lower surface of said packing washer thus blocking said at least one slit to prevent leakage from the container; and spring means to bias said stem and said stem extension upwardly in unison.

4,029,262

ANIMAL EXCREMENT DISPOSAL APPARATUS

Radovan P. Lazich, 2735 Kroy Way, Sacramento, Calif. 95817, and Adolph P. Cascardo, 2233 Mission Ave., Carmichael, Calif. 95608

Filed Apr. 13, 1976, Ser. No. 676,546
Int. Cl.² B02C *23/36*
U.S. Cl. 241—43 **8 Claims**



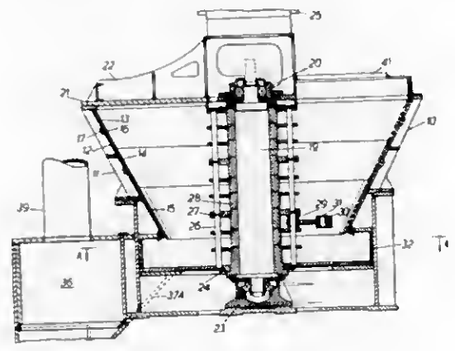
1. An animal excrement disposal apparatus comprising; portable means for emulsifying and holding animal excrement so it may be used for liquid fertilizer including a primary receptacle of conical configuration having a large opening at the top thereof, a closure means for said top opening, means rotatably within the receptacle for breaking up solid excrement, means for admitting liquid to the receptacle, further means for exhausting the liquid fertilizer from the receptacle, the means rotatably mounted within the receptacle for breaking up solid excrement includes a motor attached to the bottom of the receptacle, a drive shaft extending from the motor into the receptacle, means on the drive shaft for cutting the excrement into pieces, additional means associated with the drive shaft for emulsifying the excrement, and the means on the drive shaft for cutting the excrement includes a conically shaped rotor formed of a plurality of cutter blades having an overall shape which complements the interior shape of the primary receptacle.

4,029,263

BALLISTIC PULVERISER SEPARATOR

Albert Edward Roy Wilkinson, Sheffield, and Nigel Dane Quartano Candler, Hungerford, both of England, assignors to Tollemache Environmental Engineers Limited, Surbiton, England

Filed Mar. 31, 1975, Ser. No. 563,511
Int. Cl.² B02C *13/282*
U.S. Cl. 241—188 R **6 Claims**



1. A pulveriser separator comprising, in combination:
a. a housing;
b. an upwardly divergent funnel portion consisting of a plurality of imperforate pulveriser plates disposed to provide a polygonal cross-sectional inner perforate for the funnel, said plates comprising inner skin plates and outer skin plates, the inner skin plate of each face of the polygon being formed by a plurality of axially adjacent plate portions.
c. a downwardly depending skirt portion of said housing extending downwardly from said funnel portion; and
d. at least one hammer mounted for rotation about the substantially vertical axis within said housing.

4,029,264

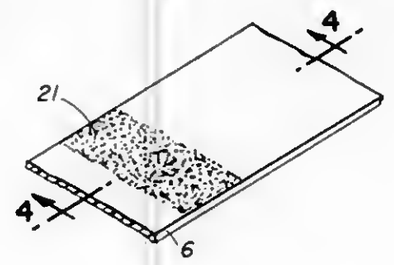
CLING FILM ROLL HAVING A NODULOSE LEADING EDGE PORTION AND THE METHOD AND APPARATUS FOR PRODUCING IT

Ronald Griffith Reese, La Salle, Ill., assignor to Union Carbide Corporation, New York, N.Y.

Filed May 3, 1976, Ser. No. 682,533
Int. Cl.² B65H *81/00*
U.S. Cl. 242—1 **4 Claims**

1. In a roll of consumer type plastic wrapping cling film having a relatively high tendency to cling to itself, the improvement comprising the leading edge portion of the film having a plurality of surface disturbances consisting of small

stretched areas projecting from the surface of the film thus forming a substantially nodulose leading edge portion which is



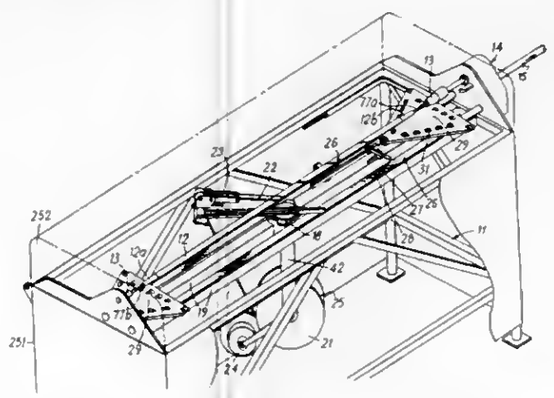
readily identifiable and adapted for easy grasping to initiate start of the roll.

4,029,265

WINDING FLEXIBLE STRIP MATERIAL ON CORES WITH FRUSTO-CONICAL ENDS

Leslie Herbert Piper, Fareham, England, assignor to High Temperature Engineers Limited, England

Filed Mar. 25, 1975, Ser. No. 561,975
Claims priority, application United Kingdom, Mar. 25, 1974, 13163/74
Int. Cl.² B65H *81/06*
U.S. Cl. 242—7.23 **9 Claims**



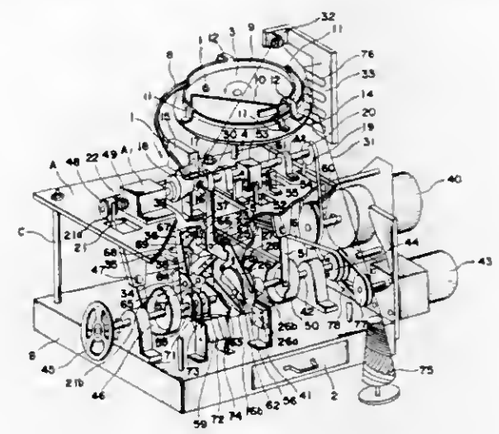
1. An apparatus for winding a strip or strand of flexible material on a frustum-forming portion of a rotatable core, comprising means for rotatably mounting and for rotating a core about an axis, a carriage mounted for reciprocal movement longitudinally of the core, carriage drive meand for longitudinally moving the carriage, a feed arm for feeding the strip or strand from a spool to the core, the feed arm being mounted on the carriage for swinging movement about an instantaneous axis transverse to the core axis, and means for coordinating the longitudinal movement of the carriage and the swinging movement of the feed arm to increase the angle that the strip or strand makes to the axis of the core as the carriage moves in the direction towards the smaller end of the frustum, said carriage stopping and reversing direction as said arm passes through an approximately 90-degree angle with respect to the core axis, and to continue to swing the feed arm in the same angular direction during return movement of the carriage towards the larger end of the frustum in such a manner that successive turns of the flexible material deposited on the frustum have progressively changing angles with respect to the axis of the core.

4,029,266

AUTOMATIC THREAD WINDING APPARATUS

Takashi Mori, Yamatokoriyama; Michio Kato, Hirakata; Koichi Mizu, and Yoshikazu Nishida, both of Neyagawa, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

Continuation-in-part of Ser. No. 435,575, Jan. 22, 1974, abandoned. This application Nov. 6, 1975, Ser. No. 629,782
Claims priority, application Japan, Jan. 26, 1973, 48-11447; Jan. 26, 1973, 48-11452; June 15, 1973, 48-68050; June 15, 1973, 48-68052; Dec. 20, 1973, 48-2778
Int. Cl.² B65H *54/00*
U.S. Cl. 242—20 **9 Claims**



1. An automatic thread winding apparatus for successively winding thread on double-flanged bobbins, which comprises in combination:
a bevel-shaped dish for arbitrarily receiving a plurality of the bobbins therein, said bevel-shaped dish being rotatably supported in a horizontal position, rotating means coupled to said dish for continuously rotating said dish in one direction, a guide wall extending fixed in position slightly above said dish and around a part of the circumference of the dish slightly inwardly of the periphery of the dish, and a wire guide fixed in position around and just above the peripheral edge of said dish;
winding means including a pair of axially aligned first and second holding means for firmly holding each one of the empty bobbins in a winding position between said first and second holding means in readiness for winding operation;
a pair of spaced parallel wires, one extending from said wire guide and the other from an end of said guide wall adjacent the periphery of said bevel-shaped dish, said spaced parallel wires extending to a position adjacent to and spaced from said winding position;
said guide wall and said guide wire guiding the bobbins placed on said dish towards and onto said spaced parallel wires during rotation of said dish;
a guide block supported in position at said position adjacent to and spaced from said winding position and including a bobbin passage formed therein, said spaced parallel wires being coupled to said guide block at one end of said bobbin passage;
a bobbin transfer member supported in position for pivotal movement between first and second positions, said bobbin transfer member having a bobbin receiving seat which is aligned with the other end of said bobbin passage in said guide block when said transfer member is in said first position and is brought to said winding position when said transfer member is in said second position, said bobbin transfer member further having a portion therein which moves past said other end of said bobbin passage in said guide block during pivotal movement of said transfer member between said first and second positions for

blocking the movement of the next bobbin on said bobbin passage from falling out of said bobbin passage;
thread anchoring means adjacent said holding means for anchoring the thread to the bobbin that is held in position between said holding means;
first means operatively coupled to one of said holding means for rotating said one of said holding means;
second means operatively associated with one of said holding means for axially moving said one of said holding means which is associated therewith, said one of said holding means associated with said second means being moved close to the other of said holding means for first tightly holding each bobbin that has been transferred by said bobbin transfer means onto said winding means in position between said holding means and then withdrawing slightly from the transferred bobbin, said axially movable holding means having an axially retractable mounting spindle carried thereby for axial movement in a direction aligned with the holding means independent of the axial movement of said axially movable holding means, and being inserted into the center of the transferred bobbin during movement of the axially movable holding means toward the bobbin and remaining within said bobbin during said slight withdrawing movement, and said each bobbin and said holding means of said pair being synchronously rotated by said first means through said one of said holding means which is coupled with said rotating means, thereby winding the thread thereon;
detecting means adjacent said holding means and coupled to said rotating means for detecting whether or not the bobbin has had a predetermined quantity of thread wound thereon and for interrupting operation of said rotating means upon attainment of the predetermined quantity;
doffing means coupled to said holding means and operable upon completion of the winding operation for axially moving said one of said bolding means to release the full bobbin, said doffing means including a severing means for severing the thread to separate the thread wound on the bobbin from that leading from a thread supply device; and
a storage receptacle beneath said doffing means for receiving the filled bobbins after the severing operation has been completed; and
temporary storage means positioned below said winding means and between said winding means and said storage receptacle and substantially adjacent to said severing means for receiving the full bobbin from said holding means under the effect of gravity and temporarily storing the filled bobbin therein to assist said severing means, and for ejecting the filled bobbin into said storage receptable after said severing operation is completed.

4,029,267

LOCKING SAFETY BELT REELS

John Richard Slipper, Chichester, England, assignor to Wingard Limited, England

Filed Dec. 23, 1975, Ser. No. 643,650
Claims priority, application United Kingdom, Jan. 9, 1975, 973/75
Int. Cl.² B65H *75/48*; A62B *35/02*
U.S. Cl. 242—107.4 A **13 Claims**

1. An improvement in a mechanically operable safety belt retractor, of the type comprising a belt storage reel, means biasing said reel in a belt retraction direction, toothed means mounted for rotation with said storage reel, a pawl, means mounting said pawl for movement from an inoperative first position to an operative second position engaging said toothed means for locking said reel, and an inertia responsive mass for moving said pawl from said first position to said second position when a predetermined minimum acceleration is exceeded, the improvement comprising a flexible member connected to said pawl and supported thereby for movement in the direction of motion of said pawl, said flexible member being:
   a. directly engageable with said mass for causing engagement of said flexible member with said toothed means,
   b. spaced from said pawl by a predetermined distance to ensure correct phased engagement between said pawl and said toothed means, and

   c. flexurally movable relative to said pawl to absorb the impact between any tooth of said toothed means and said flexible member

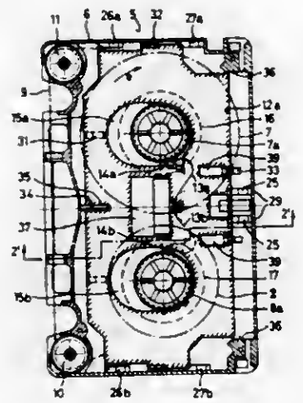
whereby a reaction is avoided on said mass due to engagement between said flexible member and said toothed means when rotating, said pawl being subsequently urged into correct phased engagement with said toothed means for locking said reel.

4,029,268

TAPE RECORDER AND MAGNETIC TAPE CASSETTE

Klaus Schoettle, Heidelberg; Heinrich Wittkamp, Mannheim; Lothar Gliniorz, Frankenthal, and Peter Dobler, Ludwigshafen, all of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen (Rhine), Germany

Filed Sept. 30, 1975, Ser. No. 618,042
Int. Cl.² G11B *23/10*
U.S. Cl. 242—198 **7 Claims**



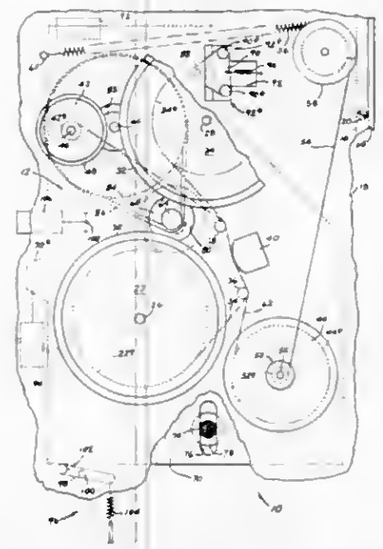
1. In a magnetic tape cassette which comprises a substantially rectangular housing having a bottom wall, a top wall, a front wall and side walls and containing
   a pair of hubs each provided with a circular toothed portion and adapted to carry packs of magnetic tape, said bottom and/or top walls having therein apertures at least some of which are disposed to accommodate the drive spindles and capstans of a tape recorder, said front wall baving therein at least one opening for accommodating tape-scanning means and at least one pressure roller carried by said tape recorder, said opening being arranged so that said pressure roller bears against the length of tape passing along the front wall of the cassette and on the inside thereof;
   resilient means; and
   control means movable against the action of said resilient means in a plane substantially parallel to the cassette plane, between a first, off-recorder position in which said control means rendor said length of tape taut along said front wall and clamp said hubs in place, and a second, on-recorder in which said control means release said length of tape as well as said hubs; the improvement
   that said bottom and top walls of the cassette housing are provided with cam portions; and
   that said control means include two slide plates each having an actuating portion engageable through one of said apertures and each having secured thereto a pawl disposed in cooperating relationship with the circular tooth portion of one of said hubs, said plates substantially overlying opposite sides of the two hubs and being yieldingly urged against the cam portions of said bottom and top walls, respectively, for longitudinal sliding movement on said cam portions, in a direction perpendicular to said front wall, between said first and second positions,
   such that said plates, as they are slidably moved by said actuating portion from their first to their second positions, impart by way of said pawls, a rocking movement to the circular toothed portions of the corresponding hubs, thereby to render said length of tape taut, and in riding up on the respective cam portions incident to their sliding movement, are displaced in a direction substantially perpendicular to the cassette plane, thereby to clamp said hubs between them.

4,029,269

TAPE DRIVE WITH FLOATING-PLATE-MOUNTED DRIVE SPINDLES

Glenn E. Clarridge, Portland, Oreg., assignor to Ford Industries, Inc., Portland, Oreg.

Filed Nov. 28, 1975, Ser. No. 636,059
Int. Cl.² G11B *15/30*
U.S. Cl. 242—201 **5 Claims**



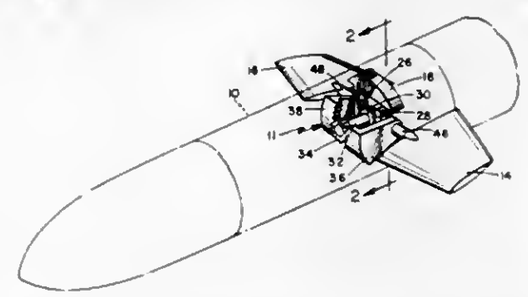
1. Tape drive apparatus comprising
   a generally planar main deck,
   tape support means mounted on said deck for supporting a length of recording tape for reversible movement, said support means including a pair of rotary elements with one being drivable in a selected direction to transport supported tape in one direction, and the other being drivable in a selected direction to transport supported tape in the reverse direction,
   a generally planar subdeck,
   means mounting said subdeck in parallel-planar spaced relation on said main deck, said mounting means being constructed to accommodate both pivoting and translating of the former (in its plane) relative to the latter,
   translating means operatively connected to said subdeck for producing selected, reversible, limited translation thereof,
   interaction means operatively interposed between said main deck and subdeck, operable to cause pivoting of the latter in one direction with operation of said translating means to produce translation of the subdeck in one direction, and pivoting of the subdeck in the opposite direction with operation of the translating means to produce translation of the subdeck in the opposite direction,
   a pair of spaced, power-operated rotary drive spindles mounted on said subdeck and projecting toward said main deck to positions laterally adjacent said pair of rotary elements one of said spindles being engageable with said one element, and being constructed and operable when so engaged to drive said one element at one speed in its said selected direction, and the other spindle being engageable with said one element, and being constructed and operable when so engaged to drive said one element at a speed greater than said one speed in its said selected direction, and further being engageable with said other element to drive it in its said selected direction, and
   biasing means acting between said main deck and subdeck normally urging the two toward relative positions wherein said one spindle engages said one rotary element, and said other spindle is disengaged from both rotary elements,
   pivoting of said subdeck in said one direction under the influence of said translating and interaction means causing disengagement of said one spindle and rotary element and engagement of said other spindle and said one element, and pivoting of the subdeck in the opposite direction under the same influence causing disengagement of said one spindle and rotary element, and engagement of said other spindle and said other rotary element.

4,029,270

MECHANICAL ROLL RATE STABILIZER FOR A ROLLING MISSILE

Byron M. Niemeier, Claremont, Calif., assignor to General Dynamics Corporation, Pomona, Calif.

Filed Aug. 11, 1975, Ser. No. 603,403
Int. Cl.² F42B *15/14*
U.S. Cl. 244—3.21 **7 Claims**



1. A rolling stabilizer system for use with an aerodynamic body having pivotal control surfaces projecting therefrom comprising:
   inertia means comprising at least two relatively high mass members supported in the aerodynamic body for radial displacements,
   an actuator means connected and responsive to the radial displacements of said high mass members for corresponding rotational displacements,
   means for adjusting the orientation of the control surfaces responsive to the rotation of said actuator means and operative to rotate the control surfaces in increments corresponding to the rotation of said actuator means and to cause a corresponding increase and decrease in the roll rate of the aerodynamic body.

said means for adjusting the orientation comprising a first drive means connected to each of said high mass members and active to impart rotational displacements of said actuator means proportional to said radial displacements of said high mass members and second drive means axially offset from said high mass members,

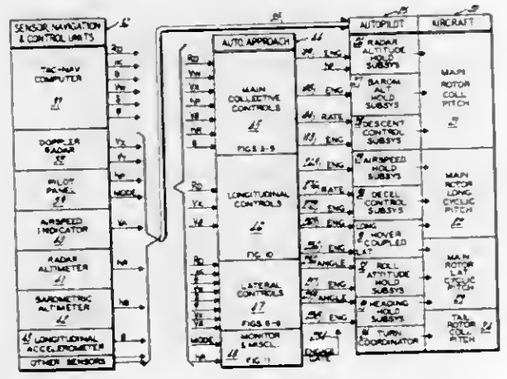
said means for adjusting the orientation comprising second driven means operatively engaged by said second drive means and driven thereby for rotational displacements.

4,029,271

AUTOMATIC APPROACH TO HOVER SYSTEM

Richard D. Murphy, and Lou S. Cotton, both of Monroe, Conn., assignors to United Technologies Corporation, Hartford, Conn.

Filed Apr. 7, 1976, Ser. No. 674,705
Int. Cl.² G05D *1/00*
U.S. Cl. 244—17.13 **18 Claims**



1. In an aircraft including an autopilot system and having navigation means providing signals indicative of aircraft flight parameters and the course and distance to a destination and a pilot set means for providing a desired hover altitude at said destination, a hover approach control system responsive to signals from said navigation means and said pilot set means to control aircraft flight through said autopilot system, comprising:

course means providing course control signals to control the heading of the aircraft to place said aircraft on a course toward said destination at a point downwind therefrom;

speed means for providing speed control signals to control the speed of said aircraft to decelerate from its speed at said point to standstill at said destination; and

altitude means responsive to said speed means for providing altitude signals to control the altitude of said aircraft for descent from its altitude at said point to said desired altitude, said altitude means generating said altitude control signals as a function of said speed control signals and range to destination throughout traverse of said aircraft from said point to said destination.

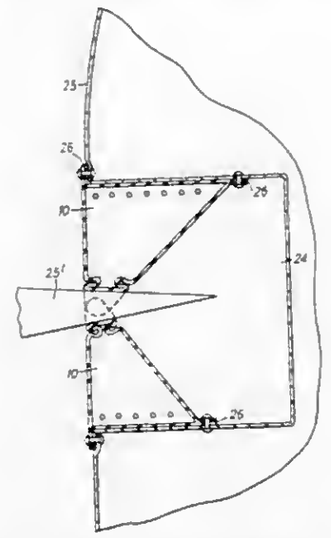
VARIABLE-GEOMETRY AIRCRAFT SEAL

Jeffrey Charles Broadhurst, Burton-on-Trent, England, assignor to Woodville Rubber Company Limited, England

Filed Mar. 8, 1976, Ser. No. 665,157
Claims priority, application United Kingdom, Mar. 10, 1975, 9875/75; July 22, 1975, 30687/75
Int. Cl.² B64C *1/34, 3/40*
U.S. Cl. 244—46 **10 Claims**

1. A variable geometry aircraft provided with a seal between a surface of an aerofoil and the fuselage, the seal comprising an elongated, inflated, flexible bag bridging a gap between the aerofoil and the fuselage, the bag being mounted in a recess in the fuselage with one wall of the bag serving as a continuation of the fuselage-surface across the gap to the aerofoil, all the longitudinal walls of the bag being of flexible material and including a flexible-base-wall affixed along two longitudinal edges to the aircraft fuselage, the bag further having a multiplicity of internal, substantially parallel, closely-spaced, flexible, transverse diaphragms, each said diaphragm having flanges along its edges and being attached by said flanges to corresponding longitudinal walls of the bag, each



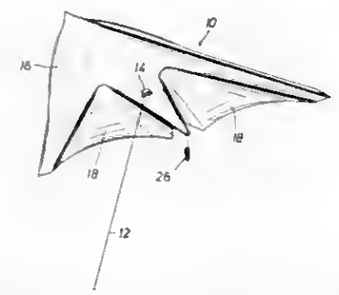
said diaphragm being constructed of a plurality of major parts of elastomeric sheet material affixed to one another, each major part being individually reinforced by a reinforcing web so arranged as to render each said diaphragm substantially inextensible, and each said diaphragm being apertured to permit the passage of inflating gas therethrough.

4,029,273

KITE

Julius M. Christoffel, Jr., 5323 Yarwell, Houston, Tex. 77035

Continuation of Ser. No. 507,342, Sept. 19, 1974, abandoned, which is a continuation of Ser. No. 320,470, Jan. 2, 1973, abandoned. This application Nov. 13, 1975, Ser. No. 631,534
The portion of the term of this patent subsequent to Apr. 9, 1988, has been disclaimed.
Int. Cl.² B64C *31/06*
U.S. Cl. 244—153 R **10 Claims**



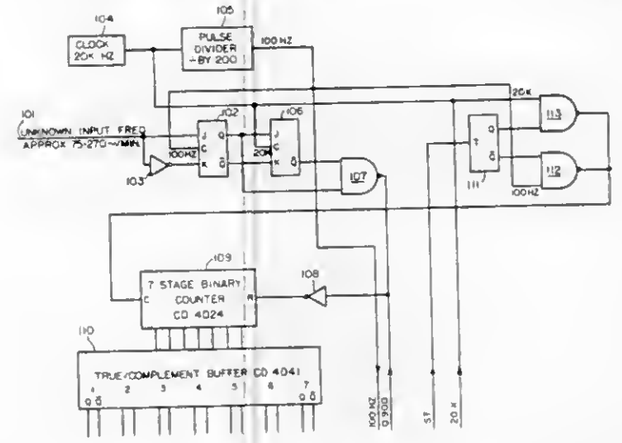
1. An inflatable kite formed of two layers of plastic having an outline forming the configuration of the kite, the two layers being secured together to form at least one inflatable air chamber, the kite having a central longitudinal axis, a string attaching member formed of an elongated member having an arm portion and a stem portion extending downwardly from the underside laterally along an axis perpendicularly intersecting the central longitudinal axis approximate the flying point of the kite, the stem portion having a plurality of string attaching locations spaced along its length.

4,029,274

TRAIN CONTROL SIGNALLING SYSTEM

Henry C. Sibley, Adams Basin, N.Y., assignor to General Signal Corporation, Rochester, N.Y.

Filed Apr. 12, 1976, Ser. No. 676,079
Int. Cl.² B61L *23/16*
U.S. Cl. 246—187 B **25 Claims**



1. A train control system for causing a train to respond in a predetermined manner to signals of predetermined cycle durations, as received on-board the train from the wayside, and having on on-board decoder which includes counting means for sensing the time duration of cycles of the received signal and wherein further on-board means is provided for checking the operation of the decoder comprising:

a. a counter for counting uniform intervals of elapsed time;

b. counter control means for activating said counter at a first rate in response to the start of a cycle of a received signal and for resetting said counter at the end of the cycle;

c. a plurality of elapsed time memory devices sequentially activated in response to said counter being advanced to predetermined counts indicative of successively larger intervals of elapsed time as measured from the start of the received signal which activated said counter;

d. control means coupling said memory devices for deactivating a previously activated memory device when a successive memory device is activated; and

e. verifying means for determining that only one of said memory devices is activated before said train is caused to respond to the decoded signal.

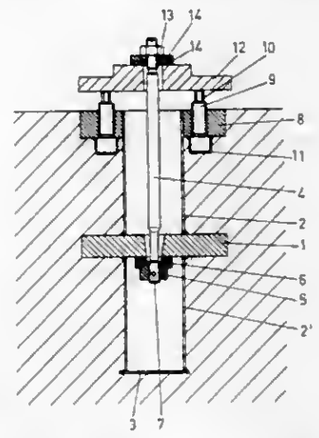
ANCHORING ASSEMBLY FOR A MACHINE BASE

Oskar Erismann, Baden, Switzerland, assignor to BBC Brown Boveri & Company Limited, Baden, Switzerland

Filed Apr. 9, 1976, Ser. No. 675,262
Claims priority, application Switzerland, May 7, 1975, 5868/75
Int. Cl.² F16B *5/02, 39/00*
U.S. Cl. 248—25 **2 Claims**

1. A foundation anchor assembly for fastening machines upon a foundation by attachment of said anchor assembly between said foundation and a base of said machine, said assembly comprising, in combination: a generally cylindrical vertically oriented pipe member defining an opening extending downwardly into said foundation to a given depth; a first plate member extending transversely across said pipe member through said opening at a location intermediate the depth thereof, said first plate member extending laterally beyond said pipe member in an embedded position within said foundation; means defining an orifice through said first plate member; an anchor bolt having a bottom end and a top end, said anchor bolt extending with said bottom end below said first plate member through said orifice in said first plate member and with said top end above said machine base through an opening in said machine base; universal joint means attaching said bottom end of said anchor bolt to said first plate member, said universal joint means comprising a washer extending about said orifice on the underside of said first plate member, said washer having a downwardly directed arcuate surface, a nut attached to said bottom end of said anchor bolt having an upwardly directed arcuate surface in sliding engagement with said downwardly directed arcuate surface of said washer, said universal joint means constituting a slued connection enabling pivotal movement of said anchor bolt thereabout; adjustment means for adjustably positioning over said opening the base of a machine to be fastened upon said foundation by said foundation anchor assembly, said adjustment means comprising a second plate member extending about the upper end of said pipe member and embedded in said foundation adjacent the upper surface thereof, and a plurality of carrying bolts threadedly engaged within said second plate member and extending upwardly therefrom with a crowned top for engagement with the underside of said machine base; a clamping nut attaching said top end of said anchor bolt to the upper side of said machine base; and compensating means comprising a pair of rings having a wedge-shaped sectional configuration taken in the axial direction thereof, said compensating means being interposed between said clamping nut and said machine base.

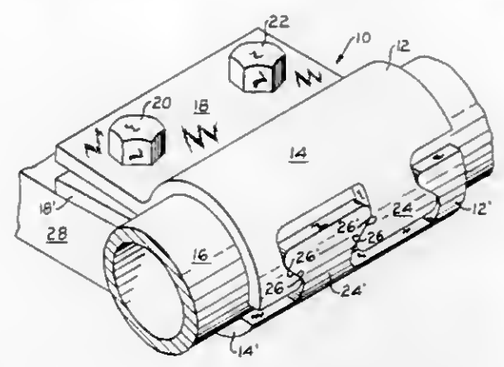


4,029,276

MOUNTING BRACKET FOR TUBULAR MEMBERS

Richard C. Zielie, North Aurora, Ill., assignor to Caterpillar Tractor Co., Peoria, Ill.

Continuation of Ser. No. 282,350, Aug. 21, 1972. This application Feb. 8, 1974, Ser. No. 440,804
Int. Cl.² F16L *3/10*
U.S. Cl. 248—74 R **1 Claim**



1. A rigid strap member for use in mounting tubular members, said strap member being generally rectangular with parallel edges at opposite ends joined by parallel sides;

the opposed major surfaces of said strap member defining parallel planar surfaces at one end of said strap member and parallel curved surfaces at the other end of said strap

member, said curved surfaces at said other end of said strap member defining half of an annular clamping means for encircling and engaging a tubular member;

dovetail means consisting of one or more dovetail slots identical to each other and a portion only of not more than one further identical dovetail slot at one side of said strap member extending through said curved surfaces at the edge of said other end of said strap member, said slots being spaced from each other to provide one or more identical dovetail tabs of slightly smaller dimensions than said slots and a portion only of not more than one further identical dovetail tab at the other side of said member;

each said slot defining a pair of mirror image elongated rectilinear side surfaces extending toward each other from respective first points spaced from the bottom of said slot to respective second points spaced from the edge of said other end of said strap member said first points being spaced further from the bottom of said slot than the spacing between said second points and said edge of said other end of said strap member; and

said strap member having a pair of apertures through said planar surfaces at said one end thereof, said apertures being equally spaced from said one end of said strap member and from the longitudinal center line of said strap member;

whereby a first one of said strap member may be inverted with respect to a second one of said strap member and said dovetail means of said first and second ones of said strap member secured together under tensile stress about a tubular member and to supporting means by passing fastening means through said apertures in said other end of each of said first and second ones of said strap member.

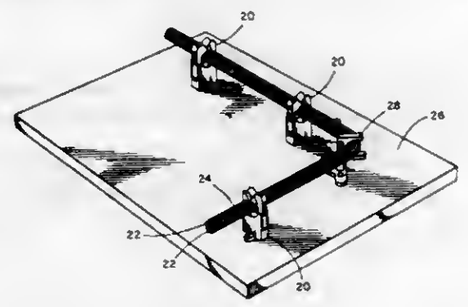
APPARATUS FOR HOLDING AND FORMING A PLURALITY OF OBJECTS INTO A BUNDLE

John J. Bolanda, New Lenox, Ill., assignor to Panduit Corporation, Tinley Park, Ill.

Filed Mar. 15, 1976, Ser. No. 666,548

Int. Cl.² F16G *11/00*; **A44B** *21/00*

U.S. Cl. 248—74 R **20 Claims**



1. Apparatus for forming a plurality of elongate objects such as wires into a bundle of circular cross section, said apparatus comprising:

a base adapted to be securely affixed to a mount such as a panelboard;

a frame for mounting on said base comprising a pair of arms extending generally upwardly from adjacent said base, each arm terminating in an end portion, said end portions being movable relative to one another between a retaining position wherein the spacing between said end portions is less than the diameter of one of said objects and a release position wherein the spacing is at least as great as the object diameter wherein said end portions define an object-receiving opening, said arms being biased toward their retaining position;

and a length of elastomeric material removably carried by said frame and free of said base, said length including a portion bridging said arms adjacent said free ends, said portion cooperating with said end portions to hold said bundle therebetween, said frame and said base comprising attachment means for releasably mounting said frame on said base and operable to remove said frame therefrom whereby upon damage to said length of elastomeric material, it can be removed from said base without removal of said base from said support.

4,029,278

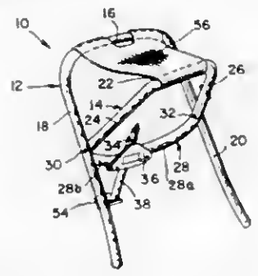
FOLDING STOOL WITH LEVELING LEG

Frank Napoleon, 902 Third Ave., Elizabeth, N.J. 07202

Filed June 21, 1976, Ser. No. 698,019

Int. Cl.² H05B *1/00*; **A47C** *13/00*

U.S. Cl. 248—188.2 **1 Claim**



1. A folding stool comprising: a first member of inverted U shape having a first rail and a pair of first legs projecting downward from opposite ends of said first rail; a second member of generally trapezoidal shape having a second rail directed parallel to said first rail; a pair of diverging arms projecting downward from opposite ends of said second rail to a position between said first legs; a third rail interconnecting the lower ends of said arms; said third rail being generally parallel to said second rail; pivot means at said position coupling said first legs to said pair of arms for relative rotation; an elongated flexible seat respectively secured at its opposite ends to said first and second rails; a generally tubular leveling leg having a plurality of apertures in its wall spaced apart along the length of said leveling leg; a guide carried at the mid-point of said third rail for slideably receiving said leveling leg; and means carried on said guide for engaging a selected one of said apertures.

4,029,279

DEVICE FOR HOLDING EACH OF THE LEGS OF A TRIPOD

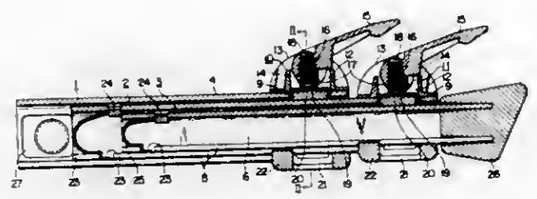
Koma Nakatani, 81, Sakae-cho, Kodaira, Tokyo, Japan

Filed June 21, 1976, Ser. No. 698,163

Claims priority, application Japan, July 25, 1975, 50-103687[U]

Int. Cl.² A45B *1/04*, *19/04*; **F16B** *7/14*

U.S. Cl. 248—188.5 **3 Claims**



1. A holding device for use in the tripod comprising:

at least two rods, each having a similar section and each of the rods being arranged in telescopic manner and provided with a through-hole at the lower end thereof except the one of the smallest diameter which is contained in the inner-most side;

holding frames, each being attached around the outer circumference of the lower end of each of the rods so as to face the through-hole;

attaching members formed integral to both sides of the holding frame;

engaging grooves formed in the attaching members and extending from the inner center of the attaching member to the holding frame, respectively;

fastening levers, each having engaging pins projected from both sides thereof, and said engaging pins being freely rotatably engaged with the engaging grooves;

pressing portions, each being formed integral to each of the fastening levers and arranged to be pressed against a face of each of the inner rods through the through-hole by turning the fastening lever; and

an adjusting screw threadably engaged in each of said pressing portions for adjustable abuttment against the respective face of said inner rods.

4,029,280

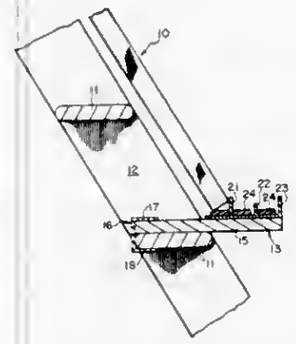
STEP LADDER ATTACHMENT

Rollin L. Golz, 1708 Peterson Ave., Janesville, Wis. 53545

Filed Oct. 13, 1976, Ser. No. 732,079

Int. Cl.² E06C *7/14*

U.S. Cl. 248—210 **6 Claims**



1. A pair of attachments adapted to be detachably mounted at opposite sides respectively of a step of a step ladder for supporting screen or storm sash each attachment comprising: a substantially rectangular wooden block the length of which is greater than the width of the step of said step ladder such that when mounted on said step the forward end of said block extends beyond the front edge of said step, a substantially U-shaped sheet metal clamp constructed and arranged to be fixedly secured at its upper reach to the rear end of said block, the lower reach of said clamp arranged to releasably engaged the rear edge of said step, and sash holding means constructed and arranged to be permanently secured to the top of said block adjacent the forward end thereof said sash holding means comprising a metal base-plate extending longitudinally of said block, said base-plate having a plurality of upstanding lugs arranged in spaced relationship longitudinally thereof, and anti-slip material mounted on said base-plate between each pair of lugs.

4,029,281

RECEPTACLE MOUNTING BRACKET

John A. Marshall, 416 Devonshire Lane, Bolingbrook, Ill. 60439

Filed July 19, 1976, Ser. No. 706,172

Int. Cl.² A47G *23/02*; **A47B** *3/00*; **A47F** *5/00*

U.S. Cl. 248—220.3 **8 Claims**

1. A bracket for mounting a receptacle to a support surface, the receptacle having a rim portion extending above the top at one end thereof and a bottom at the other end comprising:

a. retaining means adapted to be detachably secured to the rim of the receptacle and to the support surface so as to maintain the top of the receptacle in a relatively fixed position

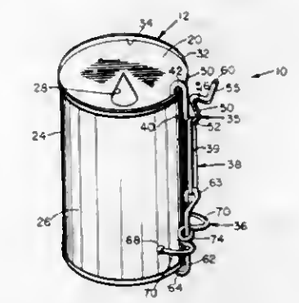
b. supporting means adapted to be suspended from said retaining means for engagement with the bottom and the side wall of the receptacle; and

c. elastic means for connecting said retaining means and said supporting means to provide axial restraint therebetween for supporting the receptacle in a relatively fixed position and permitting removal of the receptacle from the bracket by stretching said elastic means to permit release therefrom;

d. said retaining means includes:

1. a body portion for engagement with the rim or side wall of the receptacle;

2. a hook extending from said body portion in spaced relation thereto to engage the rim interiorly of the receptacle; and



3. a gripping member extending outwardly from said body portion in substantially the opposite direction to said hook for securement of said retaining means to the support surface;

e. said body portion includes:

1. a first shank portion integrally formed with said hook; and

2. a second shank portion integrally formed with said gripping member and joined together with said first shank portion thereof at a loop with a vertical spacing therebetween, said loop adapted to retain said elastic means in fixed relation thereto.

4,029,282

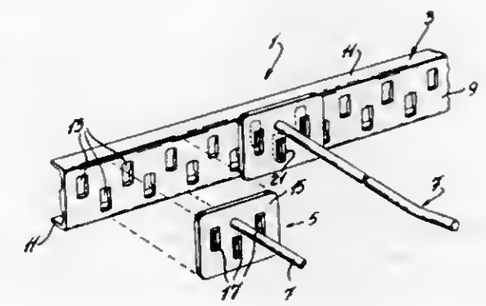
WALL BRACKET AND CLIP ARRANGEMENT

Michael F. Dauth, Montreal, Canada, assignor to Metalworks Limited, Quebec, Canada

Filed May 2, 1975, Ser. No. 573,986

Int. Cl.² A47F *5/00*

U.S. Cl. 248—221.1 **5 Claims**



1. An assembly for supporting objects on a wall surface, said assembly being adapted to be mounted on said wall surface, and comprising, a longitudinally extending rail for mounting on said wall surface and comprising a front member having a front surface substantially parallel with said wall surface and spaced from said wall surface by first and second side walls at opposite ends of said front member, said first and second side walls extending at substantially 90° to said front member;

said front member comprising a material of a first thickness;

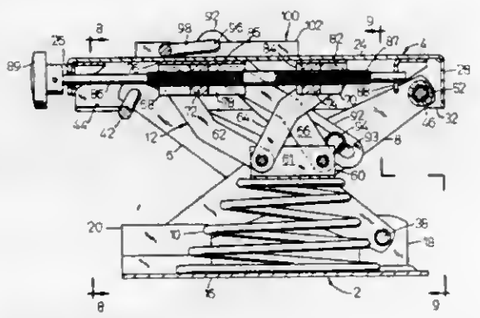
said front member comprising a plurality of spaced open-

ings, said spaced openings being disposed along an upper row and a lower row, the opening in any row being disposed between two adjacent openings in the other row;
a clip means for mounting on said rail and comprising:
a base member having a first surface and a second surface;
hanger means extending from said first surface;
three spaced hook means extending from said second surface, the spacing of said hook means matching the spacing of said openings for engaging in said openings of said rail, said three hook means being disposed in an upper row and a lower row, said upper row comprising two of said hook means, the third hook means being disposed in said lower row between said hook means in said upper row;
the spacing between the inner surface of each hook means and the second surface of the base member being less than the first thickness of the material of the front member of said rail.

4,029,283
SEAT SUPPORTING ASSEMBLY

Richard F. Swenson, Milwaukee; Shawn H. Eimen, Menomonee Falls, and John J. Gryga, Jr., Milwaukee, all of Wis., assignors to Milsco Manufacturing Company, Milwaukee, Wis.

Filed Feb. 2, 1976, Ser. No. 654,570
Int. Cl.² F16M *13/00*
U.S. Cl. 248—399 **9 Claims**

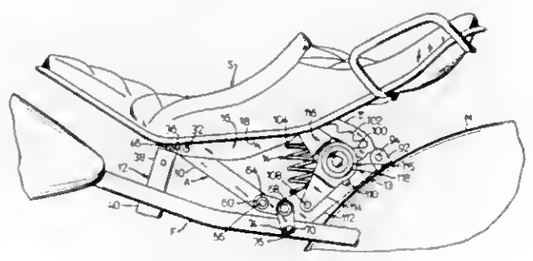


1. A seat supporting assembly comprising:
a base member;
a seat support positioned above said base member and supported for vertical movement;
at least one pair of arms disposed between said base member and said seat support and movable to permit vertical movement of said seat support;
resilient supporting means and height adjustment means disposed in vertically stacked adjacent relationship and between said base member and said seat support, said height adjustment means including a plurality of pivotal linkages, each of said pivotal linkages opposite ends, one of said ends being pivotably connected to said resilient supporting means, and including means for causing relative movement of at least two of the other of said ends toward each other whereby said height adjustment means expands vertically moving said seat support upwardly; and
means for limiting the vertical movement of said seat support, said means for limiting the vertical movement of said seat support being adjustable for selectively adjusting the extent of vertical movement of said seat support and including connecting means for operably connecting said seat support and at least one of said pair of arms and for limiting movement of said one of said pair of arms with respect to said seat support, said connecting means being shiftably connected to said seat support for movement with respect to said seat support and said one of said pair of arms slideably engagable with said connecting means.

4,029,284
SEAT SUPPORT ASSEMBLY FOR A RECREATIONAL VEHICLE

Richard F. Swenson, Milwaukee, Wis., assignor to Milsco Manufacturing Company, Milwaukee, Wis.

Filed Mar. 12, 1976, Ser. No. 666,492
Int. Cl.² A45D *19/04*; F16M *13/00*
U.S. Cl. 248—399 **9 Claims**



1. A seat supporting assembly for use in a recreational vehicle to resiliently support a seat, said seat supporting assembly comprising:
at least a pair of spaced apart pivotable arms, including a forward arm and a rearward arm, each of said arms including an upper end pivotably connected to said seat and a lower end pivotably connectable to said vehicle, said arms each being inclined forwardly and upwardly and supporting said seat for generally vertical movement, and said rearward arm including a longitudinally extending slot therein; and
a spring assembly for resiliently supporting said seat and including a lower end pivotably supportable by said vehicle intermediate said lower ends of said forward arm and said rearward arm, and including an upper end shiftably supported by said longitudinal slot wherein said spring assembly is moveable between a substantially vertical position wherein said seat is resiliently supported by said spring assembly to a position wherein said spring extends rearwardly and wherein said upper end of said spring assembly is received adjacent to said lower end of said rearward arm wherein the resilient support of said seat by said spring assembly is reduced, a second spring assembly rigidly supportable by said vehicle, said seat including a forward end and a rearward end, said second spring assembly being connected to said forward end of said seat for resiliently supporting said forward end.

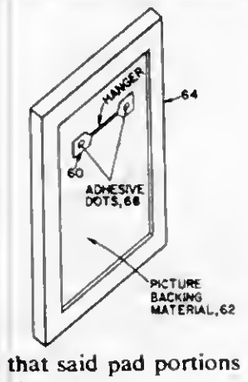
4,029,285
WALL HANGER

Robert Kanof Tendler, Buckridge Drive, Amherst, N.H. 03031

Continuation-in-part of Ser. No. 400,662, Sept. 25, 1973, Pat. No. 3,868,086, which is a continuation-in-part of Ser. No. 235,174, March 16, 1972, Pat. No. 3,788,588. This application Jan. 17, 1975, Ser. No. 541,934
The portion of the term of this patent subsequent to Jan. 29, 1991, has been disclaimed.
Int. Cl.² A47F *7/14*
U.S. Cl. 248—467 **5 Claims**

1. In combination, a hanger for use in the hanging of structures to a wall comprising a unitary one piece molded structure of resinous material including two flat separated pad portions lying substantially in one plane, and a flexible member between said pad portions.

a structure to be hung, and
means for adhesively attaching said hanger to said structure



to be hung such that said pad portions are in horizontal spaced apart relation.

4,029,286
APPARATUS FOR THE CONSTRUCTION OF CEILING IN MULTI-STORY CONCRETE BUILDINGS

Bernard Ahl, Bonner Wall 37, 5 Cologne 1, Germany

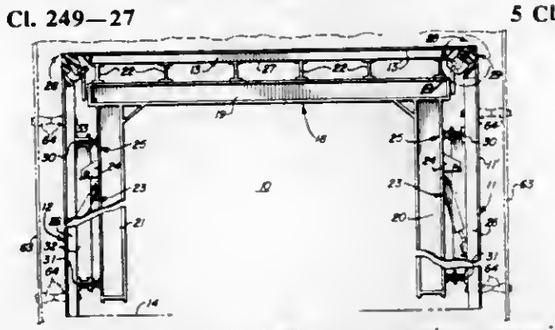
Filed Apr. 16, 1973, Ser. No. 351,435
Claims priority, application Germany, Nov. 16, 1972, 2256262
Int. Cl.² E04G *11/20*, *11/38*
U.S. Cl. 249—19 **4 Claims**

1. Apparatus for constructing ceilings during the construction of a multi-story building after the completion of peripheral walls of the building comprising means for installing ceilings sequentially from building top to building bottom, said ceiling installing means including platform means for receiving thereon flowable and settable material, means for supporting the platform means until the flowable material has set, means for lowering the platform means to be a next lower position for subsequent molding operations, means for anchoring said platform means during the setting of the flowable material, said anchoring means are rigid bars, first means for coupling said bars to said platform means, second means for coupling said bars to a next uppermost earlier formed ceiling, said supporting means are flexible cables, third means for coupling an end of each cable to said platform means, and said bars and cables being disposed one each as an immediately adjacent pair at spaced points of said platform means whereby said platform means in the area of each pair of a bar and cable is jointly suspendingly supported thereby.

4,029,287
APPARATUS FOR FORMING MODULAR BUILDING STRUCTURES

Harold D. Burdett, 3802 Grandview, Tempe, Ariz. 85282

Division of Ser. No. 510,507, Sept. 30, 1974, Pat. No. 3,993,720. This application Mar. 11, 1976, Ser. No. 666,066
Int. Cl.² E04G *11/02*
U.S. Cl. 249—27 **5 Claims**



1. An expandable form for hollow core castings comprising:
a pair of spaced substantially parallelly arranged vertically positioned side members forming platens one on each side of a longitudinal axis,
a second frame member coaxially aligned with said platens and comprising at least one pair of spaced vertically positioned legs one on each side of said longitudinal axis and a top laterally positioned on the top of said legs,
each of said legs being attached to and supported by the juxtapositioned platen in one position and pivotally movable relative to the platen to another position,
actuating means mounted to extend between said platens and said legs of the associated juxtapositioned frame member,
the side edges of said top cooperating with the top edges of said platens to form corner openings,
a plurality of inside corner forming members pivotally mounted on and extending along the top edges of said platens, and
means connected to said corner forming members for pivoting said corner forming members into said corner openings to close said corner openings and to pivot said corner forming members away from said corner openings previous to actuation of said actuating means,
said actuating means when energized moving said platens inwardly toward each other and said top downwardly to collapse the expandable form,
said inside corner forming members each comprising a flexible filler piece having plane surfaces which extend laterally to each other to form the corners between the juxtapositioned edges of said top and the top edges of the associated platens,
said flexible filler piece comprising a mass split into two pieces along its center line to a point adjacent the intersection of said planar surfaces, and
said split being increased in size when said corner forming member is extended and positioned in said corner opening to completely close said opening.

4,029,288
CONCRETE FORM BRACKET

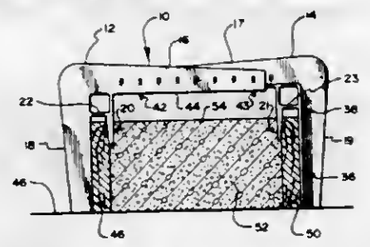
Ivin S. Murphy, 9207 Solena Way, and Melvin H. Murphy, 9916 S. 2600 East, both of Sandy, Utah 84070

Filed Jan. 5, 1976, Ser. No. 646,467
Int. Cl.² E04G *17/06*, *17/14*
U.S. Cl. 249—216 **7 Claims**

1. A bracket for holding side form walls for concrete in a fixed relative position comprising:
a horizontal crosspiece;
a vertically depending leg at each end of the crosspiece, each leg being adapted to render vertical support of a form wall engaged by the bracket against forces tending to move the form wall outwardly with respect to the bracket;
an inside support means at each end of the crosspiece inside of the corresponding leg adjacent the angle formed be-

tween the crosspiece and the depending leg, the support means accommodating restraining the form wall against forces tending to move the form wall inwardly with respect to the bracket; and

means located at each angle formed between the crosspiece



and the depending leg and integrally connected to the depending leg and spaced from the crosspiece for supporting the crosspiece an incremental distance above from walls engaged by the legs and the inside support means.

4,029,289

CONTROL SYSTEM FOR GATE-VALVES

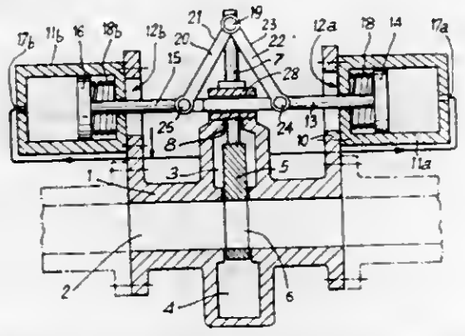
Hubert Miffre, Elancourt, France, assignor to Institute Francais du Petrole, des Carburants et Lubrifiants et Entreprise de Recherches et d'Activities Elf, Paris, France

Filed Dec. 11, 1974, Ser. No. 531,782

Claims priority, application France, Dec. 11, 1973, 73.44113

Int. Cl.² F16K *31/122*

U.S. Cl. 251—58 **5 Claims**



1. A device for operating an automatic safety gate valve comprising a valve member movable transversely of a valve passage and connected to a valve rod, said device including:

valve actuating means comprising:

two hydraulically controlled pistons mounted on piston rods with axes parallel to said valve passage, and movable between first and second positions, and

means connecting each of said piston rods to the valve rod, which connecting means converts said movement of said pistons parallel to said valve passage into longitudinal movement of said valve rod transverse to said passage between valve-open and valve-closed positions, and

means biassing said valve actuating means toward a position in which said valve is closed.

4,029,290

IN SERVICE EXERCISABLE TILT DISC CHECK VALVE

Anatole N. Karpenko, San Francisco, Calif., assignor to Anchor/Darling Valve Company, Bala Cynwyd, Pa.

Filed May 21, 1975, Ser. No. 579,695

Int. Cl.² F16K *15/18*

U.S. Cl. 251—82 **8 Claims**

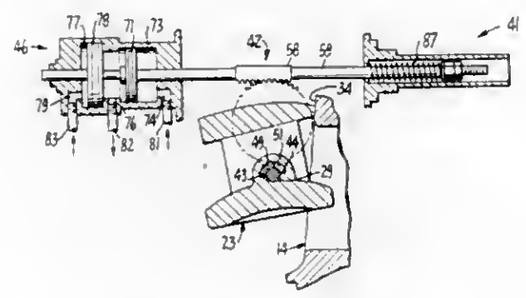
1. A tilt-disc check valve, comprising

a valve body having valve seat means therein,

tilt-disc valve means within said valve body adapted to cooperate with said valve seat means,

means positioned substantially centrally on one face of said tilt-disc valve means for both supporting said valve means and for positively rotating said valve means in both directions about an axis located substantially centrally with respect to said one face and parallel thereto,

said supporting and rotating means being adapted to positively rotate said valve means between a closed position in contact with said seat means and a partially open position out of contact with said seat means, and



lost-motion means included in said supporting and rotating means rendering said valve means free for rotational movement between the closed position and a fully open position when said supporting and rotating means is in mid-position between the limits of its travel corresponding to the closed and partially open positions of said valve means.

4,029,291

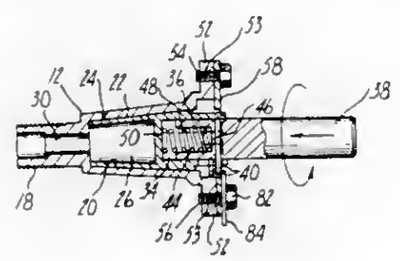
LOCKING-TYPE GAS VALVE

Everett W. Carlson, Detroit, Mich., assignor to Lincoln Brass Works, Inc., Detroit, Mich.

Filed Apr. 2, 1976, Ser. No. 673,098

Int. Cl.² F16K *35/02*

U.S. Cl. 251—96 **10 Claims**



1. In a gas valve having a body with a plug rotatable therein between off and on positions, the plug having an operating stem shiftable axially thereon to disengage a projection on said stem from an opening in a cap on said body against a spring bias to facilitate rotation of the plug from off to on position, improved structure wherein,

said cap is secured to said body at least in part by a screw, said opening being disposed adjacent said screw,

and washer means on said screw overlying at least a portion of said opening and forming an obstruction to axial movement of said projection through said opening beyond said cap under said spring bias.

4,029,292

GLOBE VALVE CONSTRUCTION

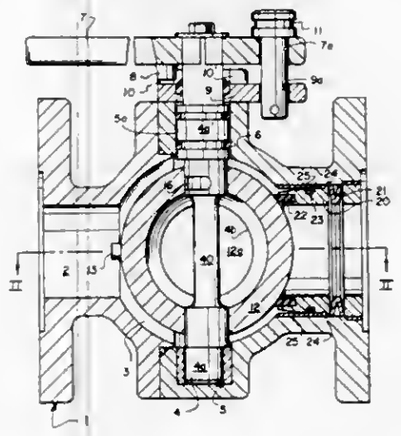
Rolf Kramer, Siegen, and Felix Schneider, Netphen, both of Germany, assignors to Eisenbahn-Verkehrsmittel AG, Germany

Filed Apr. 6, 1976, Ser. No. 674,082

Int. Cl.² F16K *25/00*

U.S. Cl. 251—163 **6 Claims**

1. A valve construction comprising a valve housing having a housing flow passage therethrough, said flow passage including an intermediate valve chamber therein, a pivot member having concentric and journal portions rotatably mounted in said housing and having an intermediate eccentric portion offset from said end journal portions located in said valve chamber, an annular sealing bushing located in said housing flow passage adjacent an end thereof and carrying an annular seal at the end thereof facing said valve chamber, a globe valve member having a spherical surface on a side facing said bushing and having a valve flow passage therethrough opening at respective diametrically opposite ends of said globe valve member, said globe valve member being rotatably supported on said eccentric portion of said pivot, said eccentric portion extending through diametrically opposite walls of said globe valve member and having an axis which is at right angles to the axis of said globe valve flow passage, means connected to said pivot to rotate said pivot through an angle of approximately



180° and to return it through the same angle, limit means defined between said housing and said globe valve member to permit pivotal movement between an open position in which said globe valve flow passage aligned with said housing flow passage and to a closed position in which said globe valve flow passage is moved out of alignment with said housing flow passage, and a lost motion connection between said pivot and said globe valve member effecting combined rotation of said globe valve member and said pivot during a portion of the rotation of said pivot and a separate relative rotation of said pivot and said globe valve member during a remaining portion of the movement, said globe valve member being shiftable due to the eccentricity of said eccentric portion during a portion of the rotation of said pivot, so as to be shifted into engagement with said annular seal on said bushing during that period in which said globe valve is not rotated relative to said pivot.

4,029,293

CONTROL VALVE

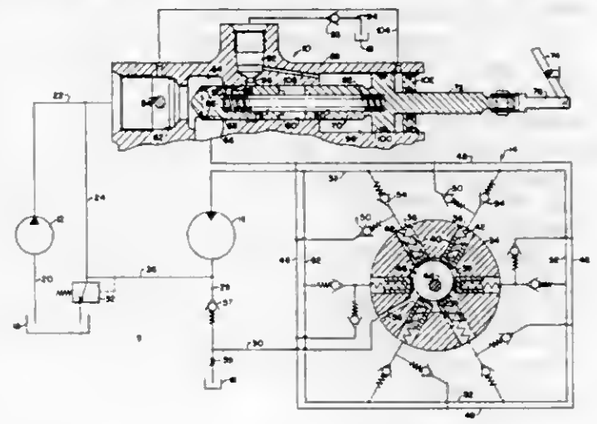
Raymond Richard Meysenburg, Cedar Falls, Iowa, assignor to Deere & Company, Moline, Ill.

Filed Sept. 4, 1975, Ser. No. 610,232

Int. Cl.² F16K *21/04, 15/18*

U.S. Cl. 251—282 **4 Claims**

1. A pump displacement control valve comprising: a valve body having a valve bore therein; an inlet port in the valve body in communication with one end of the valve bore and adapted to be connected to a substantially constant pressure source of fluid; an outlet port in the valve body in communication with the bore intermediate the ends thereof and adapted to be connected to a pump inlet; a valving piston slidably mounted in the valve bore for movement between fluid blocking and fluid passing positions; one end of the valving piston forming in combination with the one end of the valve bore first servo means responsive to fluid pressure therein to bias the valving piston toward its fluid passing position; plunger means slidably mounted in the valve bore adjacent the second end thereof; the second end of the valving piston forming in combination with the valve bore and plunger means second servo means responsive to fluid pressure to bias the valving piston toward its fluid blocking position; means providing fluid communication between the outlet port and the second servo means; said plunger means including a manually operable control rod extending from the one end of the valve bore affording manual positioning of the plunger means; compression spring means in the valve bore between the valving piston and plunger means and acting on the valving means to bias the same toward its fluid blocking position with a force dependent on the position of the plunger means; third servo means responsive to fluid pressure therein to bias the plunger means toward the valving means; and means providing fluid communication between the first and third servo means.



4,029,294

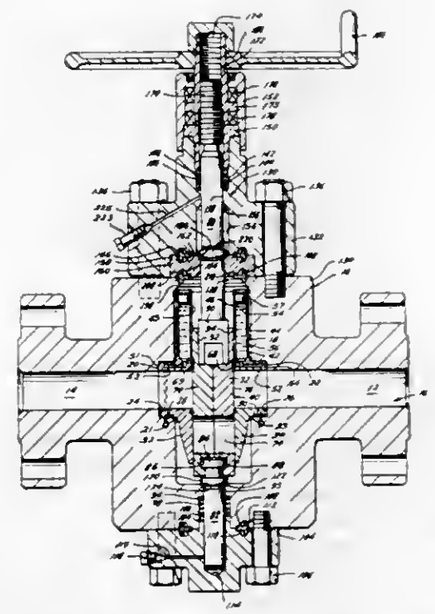
HIGH PRESSURE VALVE

John Walton McCaskill, Houston; Robert D. Barnett, Magnolia and David P. Herd, Houston, all of Tex., assignors to McEvoy Oilfield Equipment Co., Houston, Tex.

Filed Oct. 4, 1974, Ser. No. 512,092

Int. Cl.² F16K *5/22, 41/14*

U.S. Cl. 251—282 **15 Claims**



1. A valve, comprising:

a valve body having an inlet and an outlet and upper and lower apertures with a chamber therebetween;

a closure member preventing flow in the closed position and permitting flow in the open position;

a seat disposed within the chamber and housing the closure member;

seal means for sealing between said seat and said body at the outlet;

means for moving said closure member between the open and closed positions;
first and second cap members for closing said upper and lower apertures;
first metal-to-metal seal means for sealing between said first cap member and said valve body;
second metal-to-metal seal means for sealing between said second cap member and said valve body;
said closure member extending through said chamber and said upper and lower apertures and into said first and second cap members;
double seal ring means on said closure member providing a metal-to-metal sealing engagement with said first cap member in both the open and closed positions;
single seal ring means on said closure member providing a metal-to-metal sealing engagement with said valve body at said lower aperture in one of the open and closed positions, and
a lost motion connection in said closure member intermediate said single seal ring means and said double seal ring means to allow limited relative axial movement of said seal ring means.

FLUID-FLOW VALVES

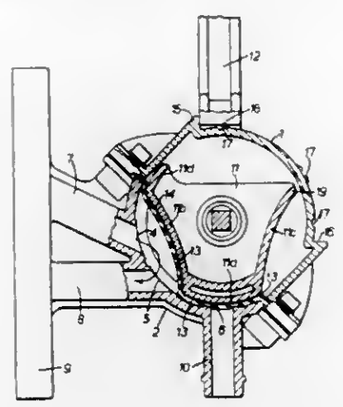
Werner Wassmer, Grenzach, Germany, assignor to Hansen GmbH KG, Germany

Filed Oct. 2, 1975, Ser. No. 618,847

Claims priority, application Germany, Oct. 3, 1974, 2447173

Int. Cl.² F16K *7/18*

U.S. Cl. 251—297 **5 Claims**



1. In a valve, means defining a multi-part casing, said casing comprising a first casing part, a second casing part, and at least two fluid flow connections, a membrane located in the casing between the first and second casing parts and acting as a dividing wall between these parts, a switching member mounted in the casing, said switching member having at least one curved switching surface bearing against the membrane, and first and second curved surface portions adjacent the switching surface, said first and second surface portions being curved in the opposite direction to the switching surface and said switching member being movable into a plurality of switching positions to provide a selected communication between, or closure of, the connections, means for moving the switching member between the switching positions, and means defining a projection at the end of the first curved surface portion to prevent the membrane from bulging when the membrane is subjected to pressure and cannot bear against the said first curved surface portion.

DIAPHRAGM VALVE ARRANGEMENT

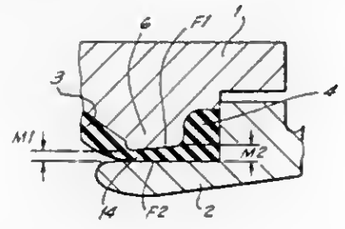
Ewald Hartmann, Cologne, Germany, and Hendrik De Blick, Bereldange, Luxembourg, assignors to Fonderie et Ateliers de Mersch S.A., Mersch, Luxembourg and Clouth Gummiwerke AG, Cologne, Germany

Filed Nov. 21, 1975, Ser. No. 634,235

Claims priority, application Germany, Nov. 22, 1974, 2455329

Int. Cl.² F16K *7/16*

U.S. Cl. 251—331 **14 Claims**



1. In a diaphragm valve arrangement, a combination comprising a pair of clamping members having respective juxtaposed surfaces which define with one another a gap and which bound an interior space, one of said surfaces having a projecting portion extending across said gap towards the other of said surfaces; and a diaphragm of resilient material, including an inner portion spanning said interior space and having a first region of substantially uniform thickness and an outer portion adapted to be clamped in said gap, said outer portion having a marginal second region spaced exteriorly of and being of greater thickness than said first region, and a recessed third region intermediate of and of lesser thickness than both of said first and second regions in unclamped condition so as to bound with said first and second regions a three-sided recess in which said projecting portion is lodged, said recessed region having relatively lesser material than said other regions due to the lesser thickness of said recessed region, to thereby substantially reduce the tendency of the material of said recessed region to flow towards said other regions when in clamped condition.

4,029,297

WINCHES FOR USE WITH HIGH MASTS

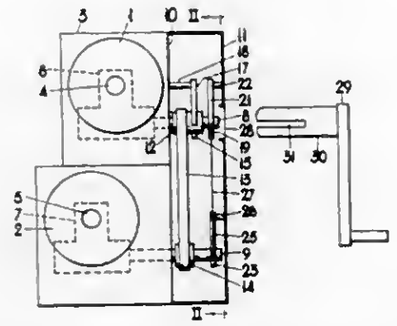
Maurice Hewlett Mounsdon, London, England, assignor to The General Electric Company Limited, London, England

Filed Oct. 8, 1975, Ser. No. 620,642

Claims priority, application United Kingdom, Oct. 11, 1974, 44105/74

Int. Cl.² B66C *23/60*

U.S. Cl. 254—139 **5 Claims**



1. A winch designed for use with a high mast and to receive a pair of ropes which in use pass up the mast and over pulleys to support a load for raising and lowering the load, and which includes a primary drum arranged for receiving one of said ropes provided with driving means to which a winch-operating tool can be connected for operating the winch, a secondary drum arranged for receiving the other rope, a primary pulley member rotatably mounted on the drive shaft of the primary drum, a secondary pulley member mounted on and keyed to the shaft of the secondary drum, and an endless band passing round and drivably linking the pulley members, the primary pulley member being provided with engagement means which can be engaged by the winch-operating tool simultaneously with the engagement of that tool with the drive shaft of the primary drum so that the secondary drum and the primary drum are then drivable together by the winch-operating tool, but when said tool is disengaged from the primary pulley member the secondary drum is disconnected from the primary drum and the latter can be driven by the winch-operating tool without the secondary drum being driven.

4. A combination comprising a hollow tubular high mast lighting column having a compartment at the foot thereof, a winch in said compartment, a pair of ropes passing up the interior of said column, pulleys carried by said mast and over which the ropes are trained to support a load in the form of a lantern carriage, said ropes being driven by said winch to raise and lower the load, said winch including a primary drum arranged for receiving one of said ropes provided with driving means to which a winch-operating tool can be connected for operating the winch, a secondary drum arranged for receiving the other rope, a primary pulley member rotatably mounted on the drive shaft of the primary drum, a secondary pulley member mounted on and keyed to the shaft of the secondary drum, and an endless band passing round and drivably linking the pulley members, the primary pulley member being provided with engagement means which can be engaged by the winch-operating tool simultaneously with the engagement of that tool with the drive shaft of the primary drum so that the secondary drum and the primary drum are then drivable together by the winch-operating tool, but when said tool is disenaged from the primary pulley member the secondary drum is disconnected from the primary drum and the latter can be driven by the winch-operating tool without the secondary drum being driven.

ESCAPE DEVICE

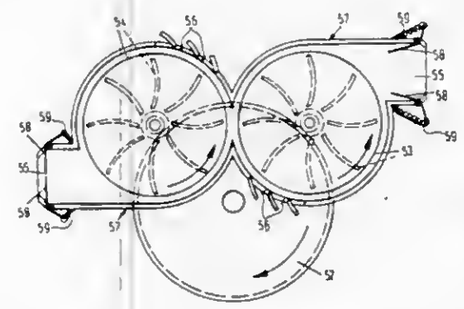
Jakob Lassche, Weerseloseweg 255, Enschede, Netherlands

Filed July 17, 1975, Ser. No. 596,719

Claims priority, application Netherlands, July 18, 1974, 7409766

Int. Cl.² A62B *1/12*

U.S. Cl. 254—158 **7 Claims**



1. An escape device comprising a frame with fastening members, a reel rotatably journalled in said frame and having a cable wound on it, said cable having a free end adapted to be connected to a load, a spiral spring constantly loading the reel in the cable winding-up sense and a brake means for limiting the speed by which the cable winds off the reel, characterized in that in the rest state the spiral spring is fastened by the inner end to a rotatable shaft and by the outer end to a rotatable shaft, which is coupled by a transmission with the reel so that, when the cable is winding off the reel, the spring is wound on said shaft with a curve opposite the curve in the rest position and in that the brake means comprises an element engaging said cable between said reel and the free end of the cable and at least one wheel carrying projecting wind blades which wheel is uncoupled from said element when the cable is in its winding direction but is coupled to said element when the cable is unwinding so as to brake said element, said wheel carrying blades are accommodated in a housing provided with an air inlet and an air outlet in at least one of which is arranged at least one flap movable against spring force.

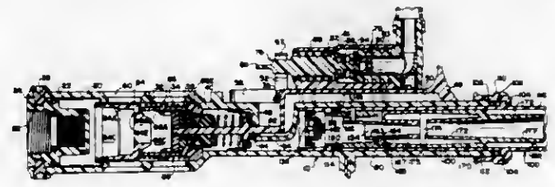
MULTI-STAGE SOLUTION PROPORTIONER DISPENSER

Valentine Hechler, IV, 26 Meadowview Drive, Northfield, Ill. 60093

Division of Ser. No. 615,800, Sept. 22, 1975, which is a continuation-in-part of Ser. No. 520,676, Nov. 4, 1974, Pat. No. 3,984,053, which is a continuation-in-part of Ser. No. 443,831, Feb. 27, 1974, Pat. No. 3,933,179. This application Dec. 8, 1975, Ser. No. 638,529

Int. Cl.² B01F *15/00;* **F04F** *5/22*

U.S. Cl. 259—4 R **11 Claims**



1. The multi-stage method of mixing and dispensing a solute with a pressurized solvent and dispensing the solution with solvent pressure comprising:
converting pressure of a flowing stream of solvent of predetermined cross-sectional flow area to kinetic energy, transferring kinetic energy to a free flowing solute at substantially atmospheric pressure to form a flowing stream of primary solution of a larger flow area and converting the flow energy of the primary solution to pressure;
converting solvent pressure of a another flowing stream of solvent of predetermined cross-sectional flow area to kinetic energy and transferring therefrom kinetic energy to said primary solution at approximately the pressure of said primary solution to form a second solution having a flow area larger than said flowing stream of primary solution and converting the flow energy thereof to pressure; and
discharging the second solution to a lower pressure environment through an opening having a flow area at least as large as the last said larger flow areas.

4,029,300

EXTRUDER OF THE DEGASSING AND MODIFICATION TYPE

Yukimasha Morishima, Kure; Minoru Yoshida, and Kimiyasu Hanaki, both of Hiroshima, all of Japan, assignors to The Japan Steel Works Ltd., Tokyo, Japan

Filed May 3, 1976, Ser. No. 682,778

Claims priority, application Japan, Oct. 17, 1975, 50-124424

Int. Cl.² B29B *1/10*

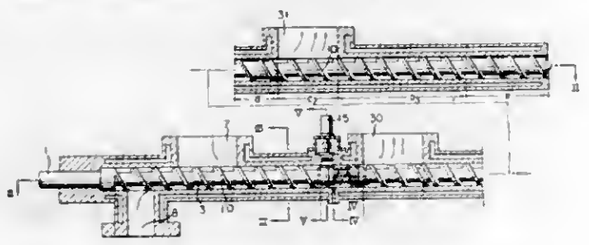
U.S. Cl. 259—192 **11 Claims**

1. In an extruder of the degassing and modification type wherein two adjoining screws are mounted in a cylinder so that they are parallel to each other and rotate in opposite directions, the improvement comprises:
said cylinder having at least one hopper orifice and at least one vent opening at its upper part in order from the rear end;
each of said adjoining screws being formed with at least one feed section, a kneading section, at least one mixing

section and a pressurizing section in order from the rear end, whereby said feed and mixing sections are located substantially below said hopper orifice and said vent opening of said cylinder, respectively;

one of said adjoining screws being further formed with a metering section in series with said pressurizing section;

said feed, mixing pressurizing and metering sections of said adjoining screws are formed respectively from a substantially continuous flight having the same outer diameter and the directions of said flights of said respective sections being different between said adjoining screws; and



each of said kneading sections of said adjoining screws being formed by an adjusting ring and a gate ring secured thereto at the rear and front ends, respectively, with a distance being left therebetween and a kneading means provided on said screw between said rings, whereby the outer diameter of said adjusting ring being substantially the same as that of said flight and the outer diameter of said gate ring being somewhat larger than that of said adjusting ring, and said adjusting and gate rings of said adjoining screws being transversely aligned so as to be substantially circumscribed with each other respectively.

4,029,301

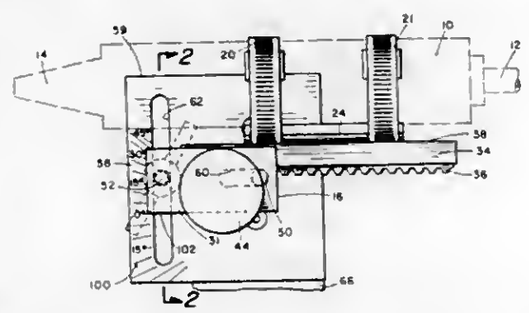
CONNECTIVE MEANS FOR PROVIDING VARIABLE ATTITUDE

Perceptimus J. Mighton, Tulsa, Okla., assignor to H & M Pipe Beveling Machine Co., Tulsa, Okla.

Filed Sept. 7, 1976, Ser. No. 721,056

Int. Cl.² B23K *7/10*

U.S. Cl. 266—77 **8 Claims**



1. Connective means providing a variable attitude between a torch and a pipe beveling machine, comprising a movable saddle supporting said torch, a fixed plate attached to said pipe beveling machine and provided with a flat surface having a central slot therein, said central slot having a first longitudinal center line, an outer slot in said flat surface having a second longitudinal center line, said first center line being perpendicular to said second center line, a pin attached at one end to said saddle and having another end opposite to said one end thereof received in said central slot at a right angle to said flat surface, said pin being slideably movable longitudinally along said central slot, a bolt attached at one end to said saddle and having another end opposite to said one end thereof passing through said outer slot at a right angle to said flat surface, said bolt being slideably movable along said outer slot, said saddle resting against and movable on said flat surface for allowing the attitude of said torch with respect to said beveling machine to be varied.

4,029,302

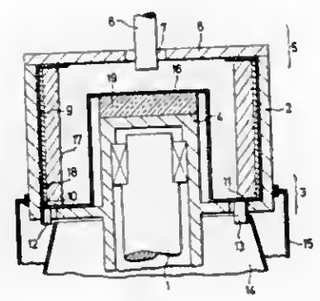
DEVICE FOR SEPARATION OF MIXTURES OF AT LEAST PARTIALLY MOLTEN METALS AND/OR METALLIC COMPOUNDS INTO AT LEAST TWO PHASES OF DIFFERENT DENSITY

Helmut Winterhager, Aachen; Roland Kammel, Berlin, and Michael Lucke, Witten, all of Germany, assignors to Kloeckner-Humboldt-Deutz AG, Germany

Filed June 6, 1974, Ser. No. 476,799

Int. Cl.² C22B *9/02*

U.S. Cl. 266—204 **5 Claims**



1. A device for separation of mixtures of at least partially molten metals and/or metal compounds into at least two phases of different density comprising:

a rotatably mounted centrifugal drum having two opposite end walls and a connecting side wall;

supply means for said mixture in one of said end walls;

a first outlet opening of a predetermined limited size for a first phase of greater density and a second outlet opening of a predetermined limited size for a second phase of less density each opening being in the other end wall, the first outlet opening being disposed at a greater distance from the axis of rotation of the drum than the second outlet opening, said outlet openings being of short axial length;

first and second axially extending guide plates for said first and second outlet openings respectively, said plates positioned in the area of the outer edge of the openings with respect to the axis of rotation and configured so that deposits on the guide plates cannot stop the flow through the openings; and

first and second annular stationary collection housings positioned with said guide plates extending axially beyond the edges of the housings so that said phases will enter said collection housings.

4,029,303

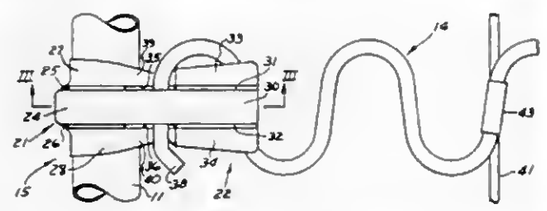
SPRING-FRAME CONSTRUCTION FOR SEATS AND THE LIKE

Howard M. Quakenbush, Apple River, Ill., assignor to Flexsteel Industries, Inc., Dubuque, Iowa

Filed Jan. 9, 1976, Ser. No. 647,880

Int. Cl.² F16F *3/02*

U.S. Cl. 267—110 **6 Claims**



6. In a spring-frame assembly for seats or the like, a pair of spaced parallel horizontal frame members having generally

cylindrical outer surfaces, a spring extending transversely between said frame members, and a pair of clips securing opposite end portions of said spring to said frame members, said spring being formed of wire bent into a generally sinuous form and including a pair of end portions generally parallel to the axes of said cylindrical outer surfaces of said frame members and an additional pair of portions parallel to said end portions and spaced inwardly therefrom, said clips having openings receiving said end portions and including inwardly projecting retaining arm sections having downwardly facing surfaces engaging upper surfaces of said additional pair of portions, said clips further including hook portions extending outwardly over said frame members thence downwardly about the outside of said frame members and thence inwardly to terminal ends and having frusto-cylindrical inner surfaces in bearing engagement with and having substantially the same radial dimension as said generally cylindrical outer surfaces, said spring being pre-formed to extend when in an unstressed condition in an arc having a predetermined radius of curvature with the straight line chordal distance between said end portions thereof being then substantially less than the distance between said frame members and being resiliently deformed when secured by said clips to said frame members to extend in an arc about an axis below the plane of said frame members and then having a radius of curvature substantially greater than said predetermined radius of curvature with said clips forming extensions of the arc formed by said spring, said spring being effective to apply forces urging said clips toward each other to engage said hook portions with said frame members and also being effective to apply torques to said clips with forces being exerted between said additional pair of portions of said springs and said downwardly facing surfaces of said retaining arm sections, and said bearing engagement between said inner surfaces of said hook sections and said outer surfaces of said frame members being effective to allow pivotal movement of said clips about the axes of said frame members in response to downward forces applied to central portions of said springs.

4,029,304

SHOCK ABSORBER FOR BUMPERS

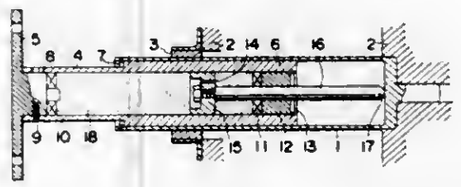
Takumi Sakaguchi, and Toshifumi Yamamoto, both of Gyoda, Japan, assignors to Showa Manufacturing Co., Ltd., Tokyo, Japan

Filed May 30, 1975, Ser. No. 582,222

Claims priority, application Japan, Dec. 26, 1974, 50-148442

Int. Cl.² F16F *9/346*

U.S. Cl. 267—64 R **4 Claims**



1. A shock absorber for bumpers comprising an outer cylinder with opposed ends having means for attachment to a car body, said outer cylinder provided at one of its ends with a closed bottom surface and at its other end with an opening, an inner cylinder slidably fitted into said opening in said outer cylinder and having means at its front end to which a bumper is to be fitted, a projection provided on the outer periphery of said inner cylinder and a stopper element on said outer cylinder co-acting with said projection on said inner cylinder so as to prevent said inner cylinder and outer cylinder from pulling apart, a rod guide fitted to said inner cylinder and having a center hole, a piston slidably fitted in sealing relationship in said inner cylinder and having a damping force generating hole, a piston rod connected with said piston and having its end part extending through said center hole of said rod guide to collide with the bottom surface of said outer cylinder and a compressive fluid enclosed in said inner cylinder, said inner cylinder being pressed into said outer cylinder so as to compress the fluid in said inner cylinder by the volume of the piston rod inserted in said inner cylinder when said inner cylinder engages said outer cylinder by said stopper, whereby on impact said piston and rod telescope into said inner cylinder thereby compressing said fluid.

4,029,305

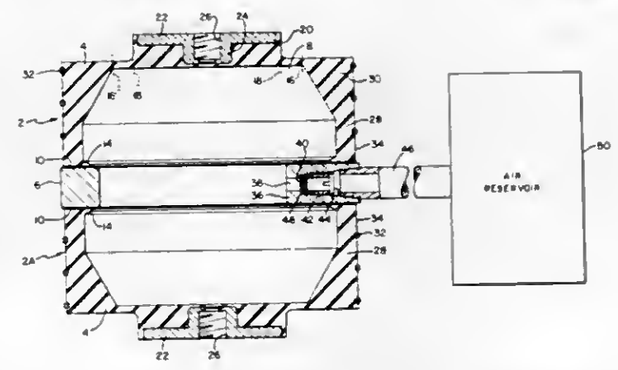
PNEUMATIC VIBRATION ISOLATOR AND SUSPENSION SYSTEM

Dale W. Schubert, Sudbury, and Charles M. Salerno, Wayland, both of Mass., assignors to Barry Wright Corporation, Watertown, Mass.

Filed Oct. 10, 1975, Ser. No. 621,509

Int. Cl.² F16F *3/67*

U.S. Cl. 267—65 R **19 Claims**



1. A device for insertion between two elements for the purpose of providing a low resonant frequency, elastically yieldable vibration isolating mount between said elements, said device comprising:

first and second hollow cylindrical blocks each having a longitudinal axis and first and second ends spaced along said axis, said first ends being open and facing one another, and each block having a substantially planar elastically deformable diaphragm attached to and closing off its second end; and

a stiff metal ring member disposed between said first ends of said blocks and securing said blocks together in tandem, said ring having an inner surface which defines an inner space that communicates with the interior spaces of said blocks and coacts with said interior spaces to form a single sealed chamber between said diaphragms capable of being pressurized with a compressible fluid;

said blocks being made of an elastically deformable material so that they can shorten under a compressive load applied parallel to said axis; said diaphragms and the fluid under pressure in said chamber coacting as a pneumatic spring having a spring stiffness along said axis less than that of said blocks; and said ring member being provided with an opening leading to said chamber for introducing compressible fluid to and withdrawing compressible fluid from said chamber.

4,029,306

SHOCK ABSORBER FOR BUMPERS

Takumi Sakaguchi, and Toshifumi Yamamoto, both of Gyoda, Japan, assignors to Showa Manufacturing Co., Ltd., Tokyo, Japan

Filed May 30, 1975, Ser. No. 582,224

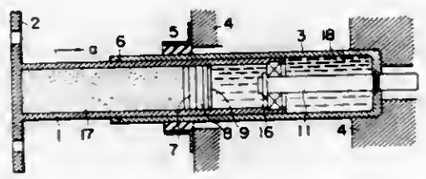
Claims priority, application Japan, Dec. 26, 1974, 50-148441

Int. Cl.² F16F *5/00*

U.S. Cl. 267—116 **7 Claims**

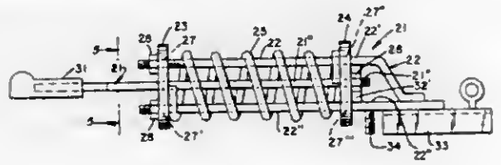
1. A shock absorber for bumpers which comprises an inner cylinder including means at the closed front end thereof for

fitting the shock absorber to a bumper, a fixed outer cylinder having a bottom surface and an open top into which the rear end of said inner cylinder is slidably engaged, a free piston slidably engaged in said inner cylinder, a high pressure fluid enclosed between said free piston and said closed front end of said inner cylinder, oil located between said bottom surface of said outer cylinder and said free piston in said inner cylinder, a tubular column engaged at the base end thereof to said bottom surface of said outer cylinder and flexibly engaged at the front end thereof to the rear end of said inner cylinder, a



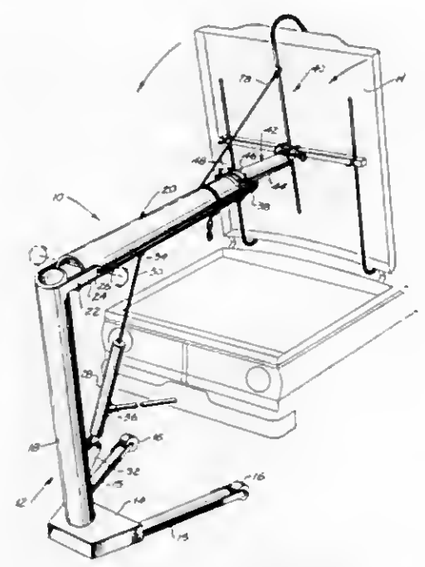
plurality of holes parallel to the axis of said tubular column and extending inwardly to an oil passage which leads to the area between the rear end of said inner cylinder and said free piston, and between the base end of said inner cylinder and the bottom surface of the outer cylinder to provide a damping force, and a plate-shaped valve slidably fitted on said tubular column and opposed to the rear end of said inner cylinder, said holes being substantially smaller than the cross-section of said tube wherein said liquid passes from said inner cylinder into said tubular column during compression.

4,029,307
CUSHIONING DEVICE
Carl J. Nielson, 926 Fourth St. SE., Minot, N. Dak. 58701
Filed Oct. 28, 1975, Ser. No. 625,894
Int. Cl.² B60D *1/00*
U.S. Cl. 267—138 **1 Claim**



1. A cushioning device comprising a first pair of parallel rods means laterally connecting said rods together at their one forward ends, a second pair of parallel rods parallel to said first pair, means laterally connecting said second pair of parallel rods together at their other rearward ends, said lateral connecting means of said first pair of rods being positioned between said second pair of rods, said lateral connecting means of said second pair of rods being positioned between the said first pair of rods, a first rod member mounted to said lateral connection on said one forward ends of said first pair of parallel rods and extending longitudinally forward away with means at the forward end of said first rod member to attach said rod member to a towing vehicle, a second rod member mounted to said lateral connection on the rearward ends on said second pair of parallel rods and extending longitudinally rearward with means on the rear end of said second rod member to attach said second rod member to a vehicle to be towed, a pair of disc members having bores, said rods being slidably mounted in said bores in said discs to slide axially in said bores, a compressable spring between said discs urging said discs apart, threaded nut means adjacent the outside of the discs and larger than the bores in said discs, and threaded onto the outer one ends of the first pair of rods and the outer other ends of the second pair of rods opposite their respective lateral connections, said laterally connecting means being adjacent outside of the discs, said nut means limiting the space between the discs, said nut means being adjustable toward one another to slightly compress the spring, so that when said device is being towed with only a moderate pulling or pushing action upon the first relative to the second rod member upon the one pair of rods relative to the other pair of rods will not cause movement of the rods, and the outer ends of both pairs of rods are free of any connection to said other structure whereby in the event a significant pushing action occurs upon the first relative to the second rod member which exceeds the expansive force of the spring the first pair of rods can slide toward the second pair of rods, with the lateral connecting means between the rods engaging and pushing the discs toward one another with the outer ends of the rods sliding outward from the discs over the opposite lateral connecting means of the respective opposing pairs of rods a distance in length of at least twice the width of the rods to significantly compress the spring and significantly cushion the pushing action and after the pushing action the spring will push the discs apart and will move the rods and rod members away from one another back to their original adjustable positions, and whereby in the event of a significant pulling action occurring upon the first relative to the second rod member which exceeds the expansive force of the spring the first pair of rods can slide away relative to the second pair of rods, with the nut means on the rods engaging and pulling the discs toward one another a distance longitudinally at least equal to twice the width of the rods thereby significantly compressing the spring and significantly cushioning the pulling action and after the pulling action passes the spring will push the discs apart and causing the rods to move toward one another back to their original adjusted positions.

4,029,308
DEVICE PARTICULARLY SUITED FOR USE IN HANDLING HOODS OF MOTORIZED VEHICLES
E. H. Mathers, Rte. 1 No. Box 138, Ward, Ark. 72176
Filed June 7, 1976, Ser. No. 693,499
Int. Cl.² B23Q *3/00*
U.S. Cl. 269—17 **3 Claims**

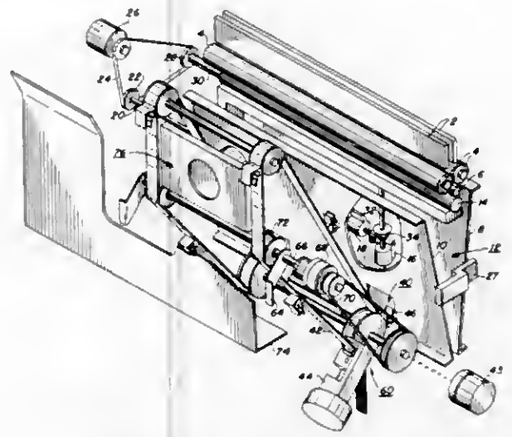


1. An article handling device particularly suited for use in the removal and installation of hoods for motorized vehicles, such as automobiles and the like, comprising:

A. hood support means adapted to be attached to a hood of a selected vehicle at a plurality of mutually spaced points including a bar adapted to be extended transversely of the hood, a pair of suspension rods arranged in substantial parallelism and extended in a common direction from the opposite ends of said bar, each of said rods being characterized by an angulated end portion adapted to engage the hood at one end thereof and support the hood in a captured relationship, and stabilizing means for stabilizing the hood as it is supported by the suspension rods including a retainer rod extended in substantial parallelism with said pair of suspension rods having an end portion of an angulated configuration adapted to engage and capture the hood at the end thereof opposite said one end; and

B. transport means connected in supporting relation with the hood support means for repositioning the hood relative to a given vehicle including a head having a base plate, means pivotally coupling the base plate to said bar, a pivotal boom mounted on a horizontally movable dolly, and means for removably connecting the base plate to the boom near one end thereof.

4,029,309
SET TRANSPORT AND STACKER
Thomas Lynch, and Larry L. Leiter, both of Fairport, N.Y., assignors to Xerox Corporation, Stamford, Conn.
Filed Oct. 29, 1975, Ser. No. 626,959
Int. Cl.² B42B *2/00*
U.S. Cl. 270—53 **5 Claims**



1. A sheet finishing apparatus including a compiler comprising opposed substantially vertical side walls for stacking sheets thereon, the top portion of said walls forming an entrance therebetween for directing sheets downwardly between said walls;

a movable sheet deflector disposed midway between said opposed side walls at the entrance thereof, movement of said deflector to a first position causing the sheets supplied to the compiler to be deposited against one of said opposed walls, movement of said deflector to a second position causing the sheets supplied to the compiler to be deposited against the other of said opposed walls to enable compiling of the sheets received therein against either wall, depending on the position of said deflector,

first and second rotary paddle means disposed centrally between said opposed side walls, said first paddle means being adapted to urge sheets received between said first paddle means and said sides in a downward direction, said second paddle means being oriented 90° from said first paddle means; and,

drive means adapted to rotate said paddle means in a first direction when said deflector is in said first position, said drive means being reversible to rotate said paddle means in a reverse direction when said deflector is in said second position to urge the sheets in the same direction irrespective of the side wall of the compiler against which the sheets are deposited.

2. A sheet finishing apparatus including a compiler comprising opposed substantially vertical side walls for stacking sheets thereon, the top portion of said walls forming an entrance therebetween for directing sheets downwardly between said walls; and,

a movable sheet deflector disposed midway between said opposed side walls at the entrance thereof, movement of said deflector to a first position causing the sheets supplied to the compiler to be deposited against one of said opposed walls, movement of said deflector to a second position causing the sheets supplied to the compiler to be deposited against the other of said opposed walls to enable compiling of the sheets received therein against either wall, depending on the position of said deflector,

binding means adapted to receive sets of copy sheets from said compiler and secure the sheets of each set together;

stacking means adapted to receive sets of copy sheets from said binding means for collecting and retaining the completed sets therein; and

transport means including endless conveyor means having a plurality of clamps thereon adapted to clamp the compiled sets and transport the clamped sets from said compiler to said binding means and from said binding means to said stacking means.

INVALID WALKER WITH BRAKES
Hal Chanslor, 435 S. Parker, Orange, Calif. 92668; Rodes C. Bullock, 119 W. Kanikaula, Apt. 104B, Hilo, Hawaii 96720, and William H. Bullock, 435 S. Parker, Orange, Calif. 92668
Filed May 1, 1975, Ser. No. 573,731
Int. Cl.² A61H *3/00*
U.S. Cl. 272—70.3 **10 Claims**

1. A steerable invalid walker comprising

a front structure,

means for movably supporting the front structure,

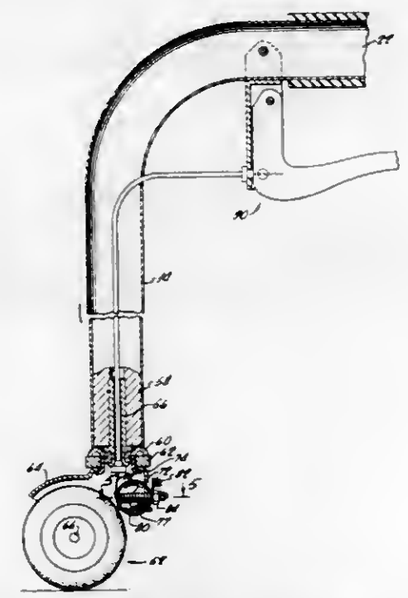
first and second rear posts,

first and second mutually spaced side structures respectively interconnecting said first and second posts with said front structure,

first and second wheels rotatably carried at lower ends of said first and second posts, respectively, for rotation about substantially horizontal axes fixed relative to said posts, and

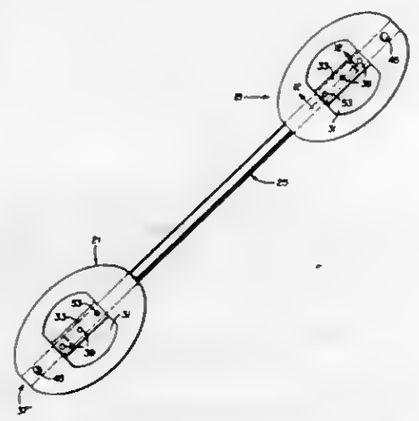
means for independently restraining rotation of said first and second wheels,

one of said wheels including a frame having a depending skirt,



said means for restraining motion of at least one of said first and second wheels comprising a cylindrical braking element positioned below and against a lower edge of said skirt and in close proximity to the periphery of said one wheel, whereby said cylindrical braking element is fulcrumed against said skirt, said braking element being free of connection with said wheel frame, and means for forcibly pivoting said braking element upon said fulcrum to press said braking element against the periphery of said wheel.

4,029,312
EXERCISING DEVICE
Forrest S. Wright, Apt. 307, 2821 Patrick Henry Drive, Auburn Heights, Mich. 48057
Filed Dec. 22, 1975, Ser. No. 642,901
Int. Cl.² A63B *11/02, 13/00*
U.S. Cl. 272—123 **14 Claims**



1. An exercising device adapted for being held in one hand comprising a generally egg-shaped housing having a longitudinal axis and having a central aperture extending through said housing in a direction normal to said longitudinal axis, said aperture being adapted to receive said hand therein, an elongated tubular handle portion interior to said egg-shaped housing and being provided with inner and outer cylindrical surfaces, said handle portion extending from one end of said housing across said aperture to the other end of said housing, said tubular handle portion having an axis which is aligned with said longitudinal axis, said handle portion being adapted to be gripably engaged by said received hand, said housing and said handle portion comprising a single unitary piece, said housing including compartments on both sides of said aperture which are adapted to receive foreign materials for increasing the mass of the device, the portion of said handle portion adjacent said central aperture of said housing being provided with a plurality of longitudinally spaced openings which extend through the inner and outer cylindrical surfaces thereof, said openings permitting the exercising device to be adjustably connected to a weight lifting bar.

4,029,313
POOL TABLE CANOPIES
Herminio Angulo, 10563 Chaney Ave., Downey, Calif. 90241
Filed Dec. 9, 1975, Ser. No. 639,070
Int. Cl.² A63D *15/00*
U.S. Cl. 273—2 **11 Claims**

1. A pool table canopy for the storage and readily accessibility of pool balls, comprising:

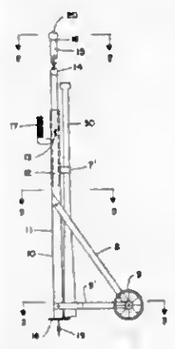
a pair of complementary but opposite facing end members inclined inwardly 15° to 20° from the vertical;

a pair of complementary but opposite facing side members, inclined inwardly 15° to 20° from the vertical, and attached to said end members forming an obelisk shaped structure;

a pair of complementary support braces attached to the inward face of said end members and said side members, traversing between the upper portion of said side members, and providing structural members for said canopy to support light fixtures thereon, each said end member and said side member having at least one aperture complementarily placed thereon, said aperture being used to hold and store a pool ball within said canopy and centrally above a pool table, the diameter of said aperture being slightly larger than the diameter of a conventional pool ball, said aperture being inwardly inclined to force the pool ball to traversely roll toward a central position of said canopy

a substantially C-channel shaped, opaque translucent shield mounted behind said aperture on the said side members and end members, said shield preventing a stored ball from rolling through said aperture, said shield preventing direct lighting of the area surrounding the pool table by diffusing said light and permitting only indirect and subdued lighting of said area.

4,029,314
GOLF GAME APPARATUS AND METHOD
John J. Dalzell, P.O. Box 316, Walhalla, N. Dak. 58282, and James E. Stover, 2250 Dorothy Ave., Boise, Idaho 83706
Filed Jan. 2, 1976, Ser. No. 646,090
Int. Cl.² A63B *57/00*
U.S. Cl. 273—32 R **1 Claim**



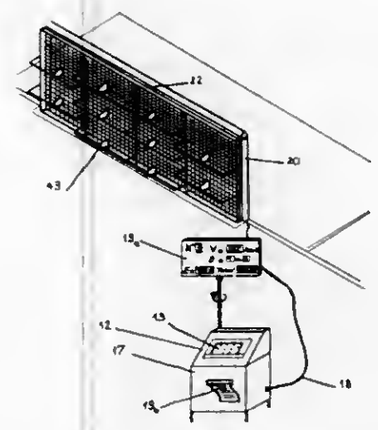
1. Gold game apparatus comprising:

a golf ball;

a portable, extensible, golf ball stand including a base having a downwardly depending spike, a tubular frame vertically mounted on said base, said frame adapted to receive telescopically a proximally located tube, a proximally located extensible tube telescopically engaging said tubular frame, said extensible tube containing at its uppermost end a socket for receiving a ball, a resilient tube containing a ball at its lowermost end for mating with the socket of said extensible tube and containing a seat at its uppermost end for supporting said golf ball, and a pair of axially aligned wheels divergently attached to a lower portion of said frame adjacent said base; and

a bat having four planar striking surfaces parallel to the longitudinal axis of said bat and having a trapezoidal cross section across the striking surfaces, said bat adapted for rotation in the hands.

4,029,315
DEVICE FOR AUTOMATICALLY EVALUATING THE BALL THROWING EFFICIENCY OF A FOOTBALL PASSER
Michel- Julien- Marius- Auguste Bon, 27 avenue Godefroy Cavaignac, 94100 Saint-Maur, France
Filed June 19, 1975, Ser. No. 588,317
Claims priority, application France, June 27, 1974, 74.22370
Int. Cl.² A63B *67/00*
U.S. Cl. 273—55 R **6 Claims**



1. A ball game practice and computing system in which a ball is thrown by a player from a normal rest position towards a goal surface and reaches the goal surface with an instantaneous speed, said system comprising:

a target generator for providing a visible target on the goal surface;

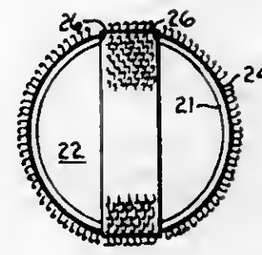
means to control said target generator, whereby the visible target appears in a selected area of the goal surface;

means for measuring the distance between the visible target and a point on the goal surface which is impacted by the ball thrown by the player;

means for measuring a parameter related with the instantaneous speed of the ball at said impact point;

means connected to the two said measuring means for computing a given relation between the parameter related to said speed and said distance, whereby the ratio of said parameter and of said distance is a data characterizing efficiency of the player.

4,029,316
GAME BALL
William Arthur Clarke, 1001 Linden Ave., Erie, Pa. 16505
Filed Feb. 19, 1976, Ser. No. 659,372
The portion of the term of this patent subsequent to Mar. 2, 1993, has been disclaimed.
Int. Cl.² A63B *65/00*
U.S. Cl. 273—58 K **18 Claims**



1. A ball adapted to stick to a target of burr adherent material, said ball consisting of two intersecting rims of impact resistant plastic in planes at right angles to each other, means for fixing said rims in the aforesaid relation, each of said rims having a substantially flat rigid outer surface and tapes having a substantially non stretchable backing and a face of synthetic burr material with the backing adhered to said flat surfaces and with the face outermost whereby a ball contacting a target of burr adherent material is held against said target,

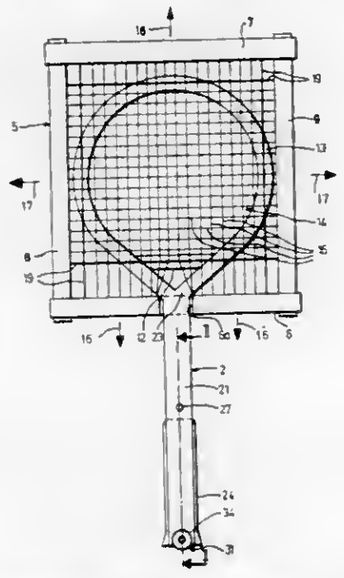
GAMES RACKET
Sven Erik Malmström, 11 Dammweg, 3904 Naters, Switzerland
Filed Sept. 5, 1975, Ser. No. 610,880
Claims priority, application Sweden, Sept. 9, 1974, 7411333; Aug. 11, 1975, 7508985
Int. Cl.² A63B *49/02, 51/16*
U.S. Cl. 273—73 C **6 Claims**

1. A method of manufacturing a games racket comprising the step of providing two, substantially mating, half-frame members having open rim portions; providing a plurality of individual substantially coplanar uncoated strings of a non-metallic material selected from the group consisting of natural and synthetic fibers; conjointly applying tension to all of the coplanar uncoated strings; while the strings are conjointly tensioned, pressing the strings between the two substantially mating open rim portions of the respective substantially mating half-frame members; and applying a bonding agent to inseparably bond the conjointly tensioned uncoated strings to both said open rim portions and the two open rim portions to each other.

3. A games racket comprising two individual substantially mating frame members each provided with a respective open rim portion and with a respective handle part connected to the

associated open rim portion; a plurality of initially uncoated individual strings, of a non-metallic material selected from the group consisting of natural and synthetic fibers crossed to



define a netting, fixed between said open rim portions while said strings are conjointly tensioned, and a bonding agent securing said two open rim portions to each other and to said netting.

4,029,318

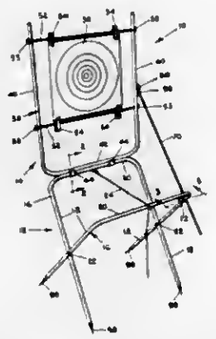
PORTABLE, ADJUSTABLE TARGET STAND

Richard K. Boss, 1677 - 32nd St. SW., Wyoming, Mich. 49509

Filed Sept. 19, 1975, Ser. No. 614,907

Int. Cl.² F41J *1/10*

U.S. Cl. 273—102 S **16 Claims**



1. A portable target stand for a firearm target comprising:

an extendible scissors frame base including a pair of elongated base members pivotably connected together at a pivot point between the ends thereof such that the height of the base is varied by relative pivotal movement of the base members, each base member having an upper portion extending above the pivot point thereof, the upper portions of the base members comprising an upper portion of the base;

target holder means for holding a target pivotably mounted on the upper portion of the base in such a manner that the target holder means can be positioned to hold the target in a generally vertical position on the base regardless of the height of the base or the relative angular positions of the base members; and

support means extending between the target holder means and the base for holding the target holder in at least one selected position with respect to the base, said support means providing a rigid, pivot-preventing interconnection between the base and the target holder means at points spaced away from the pivotal axis of the target holder means on the base at each said selected position.

4,029,319

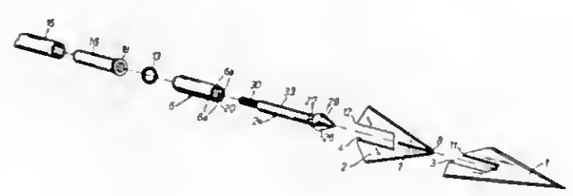
ARROWHEAD ASSEMBLY HAVING DETACHABLE LOCKING MEANS

Jack P. Christen, Onalaska, Wis., assignor to Outers Laboratories, Inc., Onalaska, Wis.

Filed Apr. 16, 1976, Ser. No. 677,559

Int. Cl.² F41B *5/02*

U.S. Cl. 273—106.5 B **3 Claims**



1. A removable arrowhead assembly comprising at least one blade having a recess extending inwardly from the rear edge thereof, a collet having at least one axial slot for the reception of said blade therein, said collet also having a cam surface and a threaded rearward end, a sleeve accommodated by said recess in said blade and having a cam surface adapted to abut against said cam surface of said collet for causing said collet to clamp tightly against said blade, said sleeve having at least one axial slot on the exterior thereof in axial alignment with said one axial slot in said collet, said slot in said sleeve receiving said blade for rigidly holding the latter in relationship to said sleeve, means located on the inner surface of said sleeve and interengaging with means on the exterior surface of said collet for preventing relative rotation between said collet and said sleeve, an insert having an internal thread for the reception of the threaded end of said collet, said insert being adapted to be secured to an arrow shaft, a metal impact ring mounted around said collet, said blade bearing against said metal impact ring when in assembled relationship, whereby said collet can be inserted in said sleeve and threadably engaged in said insert to tightly draw said collet cam surface against said sleeve cam surface for causing locking engagement of said collet against said blade.

EDUCATIONAL GAME APPARATUS AND TEACHING SYSTEM

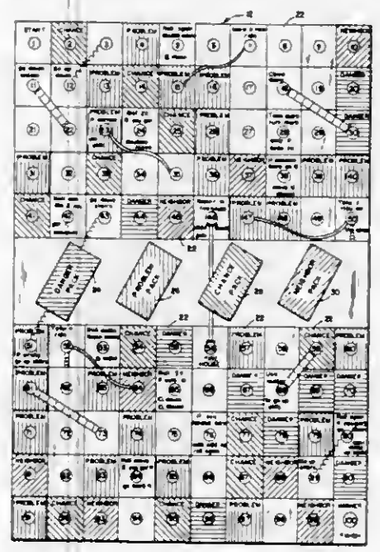
Jack Hausman, 18-05 215 St., Bayside, N.Y. 11360

Filed May 21, 1975, Ser. No. 579,317

Int. Cl.² A63F *3/00*

U.S. Cl. 273—134 AD **4 Claims**

1. An educational game apparatus in kit form adaptable for use in a classroom and designed to encourage and stimulate the learning processes by presenting selected teaching materials through a competitive game environment, said game apparatus comprising a game board having thereon a pattern of stations for defining paths of travel, a plurality of distinctive playing pieces for representing each of several game participants, the playing pieces being adapted for placement on the stations, chance controlled means for determining movement of the respective playing pieces from an initial station to a final station along alternate paths of travel, with selected stations on the game board being provided with written intelligence incorporated into the game procedure for determining the progressive movement of the playing piece landing thereon, accessory cards containing directions affecting movement of the playing pieces, said accessory cards being arranged in at least two different packs and being separately identifiable under specific headings and color coded to stations on the game board bearing similar headings and representative colors, at least one of said packs of accessory cards including tutorial cards containing specific pedagogic materials of selected subject matter and learning ability level, said tutorial cards being keyed to designated stations and integrated into the game procedure such that correct responses reinforce the learning processes by providing for the advancement of the respective playing pieces toward the final station, and further



including a pack of supplemental tutorial cards bearing other pedagogic material for selective introduction as by teacher monitoring in substitution of the first mentioned tutorial cards, said supplemental tutorial cards being programmed for interchangeable integration into the game procedure in accordance with the improved learning abilities and teaching objectives.

4,029,321

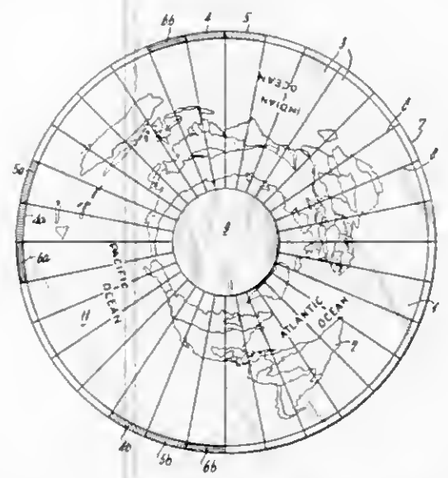
CARD AND BOARD MAP GAME

Charles G. Lang, Jr., Mato Maranhao 98, Capelas, Sao Miguel, Azores, Portugal

Filed Apr. 26, 1976, Ser. No. 679,901

Int. Cl.² A63F *3/04*

U.S. Cl. 273—135 AB **3 Claims**



1. A skill and chance influenced game comprising:

a game board containing indicia representing a map defining a large number of different political subdivisions and divided into a multiplicity of zones, there being associated with such zones indicia which correlate each zone only with a plurality of nonajacent other zones so as to provide to each player a plurality of recognizable assigned zones for his play;

a card deck containing cards divided into a plurality of sections, one section containing a type of indicia associated with a first political subdivision shown on the board and a second section containing a second type of indicia associated with a second political subdivision differing from the first shown on the board;

whereby in playing said game, a player attempts to correctly identify the position on the map of the political subdivision in his zone of play associated with any indicia on cards assigned to him and after which any second player can attempt to correctly identify the position on the map of the political subdivision in the second player's zone of play represented by the second indicia on the card.

PICKUP ARM ASSEMBLY

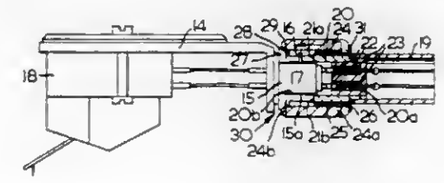
Keijiro Maeda, Yokohama, Japan, assignor to Sony Corporation, Tokyo, Japan

Filed Jan. 14, 1976, Ser. No. 648,864

Claims priority, application Japan, Jan. 18, 1975, 50-8847[U]

Int. Cl.² G11B *3/02*

U.S. Cl. 274—37 **8 Claims**



1. A phonograph pickup arm assembly comprising:

a pickup arm having an outer end portion;

a first hollow cylindrical member having a longitudinal axis and mounted on said outer end portion of said pickup arm, said member having at least one radially disposed slit;

a phonograph transducer having a connecting plug to be inserted into said first hollow cylindrical member for mounting said phonograph transducer to the outer end portion of said pickup arm;

a second cylindrical member disposed about said first cylindrical member and longitudinally moveable with respect to said first cylindrical member; and

locking means for reducing the diameter of said first cylindrical member in response to a longitudinal displacement of said second cylindrical member to clamp said transducer to said pickup arm, whereby said plug is locked in said first cylindrical member.

4,029,323

FLUID PRESSURE SEAL ARRANGEMENT

Gentei Inoue; Chuichi Sato, both of Fujisawa; Mamoru Tanaka, Yokohama, and Nobuhiro Matsuo, Kamakura, all of Japan, assignors to Nippon Seiko Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 347,529, April 3, 1973, Pat. No. 3,949,996. This application Feb. 13, 1976, Ser. No. 658,008

Claims priority, application Japan, Apr. 11, 1972, 47-35717

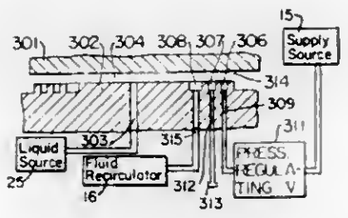
Int. Cl.² F16J *15/40*

U.S. Cl. 277—15 **1 Claim**

1. A static pressure seal arrangement for containing liquid between a planar base seat surface and a body overlying but spaced from said surface, said base seat including a liquid intake passage and a liquid outflow passage nearer the periphery of the base seat than said intake passage and connecting with a continuous liquid outlet groove recessed in said base seat surface and totally enclosing an interior area thereof, comprising,

at least a continuous inlet sealing gas groove recessed in said base seat surface and totally enclosing an interior area thereof, at least a continuous sealing gas outlet groove recessed in said base seat surface, said at least an outlet

groove being located interiorally of at least one inlet groove, said at least an outlet groove also totally enclosing an interior area of said surface, said gas inlet and outlet grooves being located exteriorally of said liquid



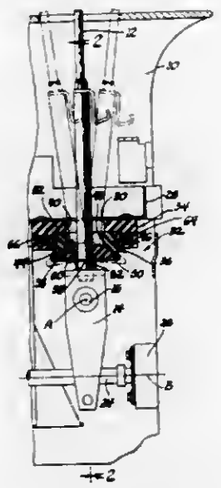
outlet groove, a supply passage in said base seat extending perpendicular and connecting with each gas inlet groove, and an output passage in said base seat extending perpendicular and connecting with each gas outlet groove.

4,029,324

SEAL ASSEMBLY FOR CONTROL LEVER

Benjamin L. Berkes, Sagamore Hills, Ohio, assignor to General Motors Corporation, Detroit, Mich.

Filed June 4, 1976, Ser. No. 692,660
Int. Cl.² F16J 15/16
U.S. Cl. 277—30 3 Claims



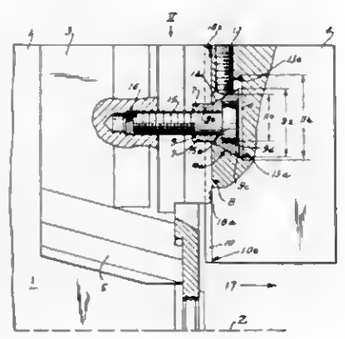
1. In combination, a wall having an enlarged opening therein, a seal assembly for sealing said enlarged opening in said wall, a control lever extending through the enlarged opening and being supported for pivotal movement about first and second mutually perpendicular non-intersecting axes with the first axis being located further from said wall than the second axis, said seal assembly comprising a stationary base member and first and second seal members adapted to be carried by the control lever and to move relative to the base member during movement of the control lever, said base member having an opening to allow movement of said control lever about said first and second axes, a first groove formed in said base member and having a first curved surface located on a sector of a circle generated by a point on said control lever as the latter is pivoted about said first axis, the first seal member being located in said first groove and having a complementary curved surface sealingly engaging said first curved surface of said first groove, a second groove formed in said first seal member and having a second curved surface located on a sector of a circle generated by a point located on the control lever as the latter is pivoted about the said second axis, said second seal member located in the second groove and having a complementary curved surface sealingly engaging said second curved surface of said second groove, the arrangement being such that when the control lever is pivoted about the first axis the first and second seal members move relative to the base member and when the control lever is pivoted about the second axis the second seal member moves relative to the first seal member and the base member.

4,029,325

CHUCK WITH RADIALLY ADJUSTABLE JAWS

Günter Horst Röhm, Heinrich-Rohm-Str. 50, Sontheim, Germany (7927)

Filed July 9, 1976, Ser. No. 704,046
Claims priority, application Germany, July 29, 1975, 2533770
Int. Cl.² B23B 31/06, 31/16
U.S. Cl. 279—123 12 Claims



1. A chuck comprising a body rotatable about an axis, a plurality of two-part jaws spaced about said axis and radially displaceable to engage a workpiece, each of said jaws including:

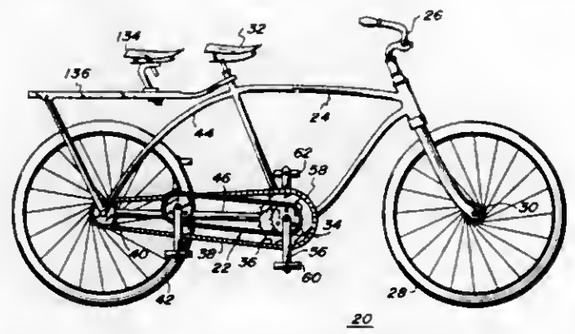
a carrier forming one jaw part and disposed on said chuck body, having a face turned in the axial direction, a radial groove formed in said face, a workpiece-engaging part with a radial guide edge mating with said radial groove of said carrier on said face, a groove of dovetail-shaped profile formed in said workpiece-engaging part transverse to said radial groove, a transverse bar of dovetail-shaped profile geometrically similar to said transverse groove projecting beyond said face of said carrier, said dovetail-shaped profile of said transverse groove being larger than said dovetail-shaped profile of said transverse bar to form an axial clearance between said transverse groove and said transverse bar at least equal to depth of engagement of said guide edge of said jaw with said radial groove of said carrier, and a radial clamping member provided on said workpiece-engaging part urging said bar against an opposite wall of said transverse groove.

4,029,326

BICYCLE CONSTRUCTION

James H. Blow, Jr., 23 Palisade Ave., Piscataway, N.J. 08854

Filed Jan. 21, 1976, Ser. No. 651,211
Int. Cl.² B62K 13/00
U.S. Cl. 280—7.16 9 Claims



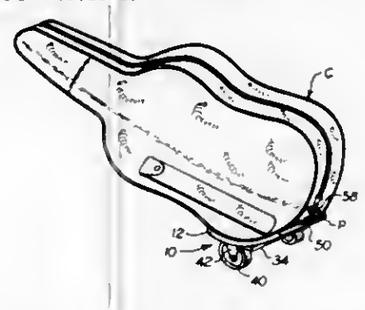
1. In a bicycle construction of the type having a frame, a front wheel, a rear wheel rotatable about a rear axle, a main seat mounted on an upper portion of said frame, main drive means connected between a lower portion of said frame and said rear wheel and including a main sprocket and a main chain drive, said main chain drive being connected between said main sprocket and said rear wheel, a forked rear wheel support extending between said lower portion of said frame and said rear axle, and a pair of main rotary pedals coupled to said main sprocket for rotating said main drive means, the improvement comprising: auxiliary drive means connected to said forked rear wheel support forwardly of said rear axle and operatively coupled to said main drive means for assisting in the rotation thereof; and a pair of independently supported auxiliary rotary pedals coupled to said auxiliary drive means for rotating said auxiliary drive means, said auxiliary drive means comprising two pairs of auxiliary sprockets including a pair of first auxiliary sprockets connected to respective ones of said auxiliary rotary pedals adjacent said forked rear wheel support forwardly of said rear axle, and a pair of second auxiliary sprockets concentrically connected to and rotable with said main sprocket said auxiliary drive means further comprising a first auxiliary chain drive connected between one of said first auxiliary sprockets and a corresponding one of said second auxiliary sprockets, and a second auxiliary chain drive connected between the other of said first auxiliary sprockets and the other of said second auxiliary sprockets, one of said auxiliary rotary pedals being coupled to one fork of said rear wheel support, the other of said auxiliary rotary pedals being coupled to the other fork of said rear wheel support, each of said auxiliary rotary pedals being independently rotatable with respect to one another.

4,029,327

STROLLER FOR ATTACHMENT TO A CARRYING CASE

Samuel Kolstein, 2801 Shore Drive, Merrkk, N.Y. 11566

Filed Apr. 27, 1976, Ser. No. 680,742
Int. Cl.² B62B 3/02
U.S. Cl. 280—47.13 R 17 Claims



1. A stroller for attachment to a case for transporting an article therein, said stroller comprising:

a. a mounting plate; and

b. a wheel support plate;

c. wheel means rotatably mounted on said support plate for 360° swivel movement;

d. shock absorbing means having portions respectively mounted on said mounting plate and said support plate for interconnecting said plates together in spaced apart relation, said means being operative between a normally extended condition and a compressed condition to effect relative movement of said plates in directions toward and away from each other;

e. said shock absorbing means being the sole structure for controlling the relative movement between said mounting plate and said wheel support plate, and for controlling the relative spacing between said plates in all directions;

f. one of said plates being disposed for movement between a rest position when said shock absorbing means is in its normally extended condition and a displaced position in the direction toward the other one of said plates when said shock absorbing means is in a compressed condition; and

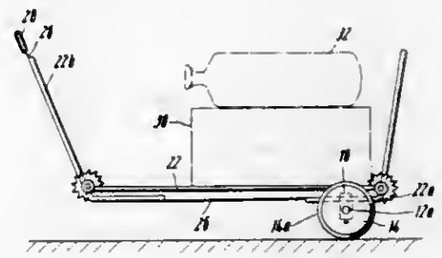
g. separable interengaging fastening means on said mounting plate, said means having a first portion connected to said mounting plate and a second portion adapted to be connected to said case for removably attaching said stroller to said case.

4,029,328

AUXILIARY TRANSPORTING DEVICE

Walter Herterich, Dachau, and Georg Probst, Munich, both of Germany, assignors to Ecofon Verkaufsgesellschaft Probst KG., Munich, Germany

Filed Sept. 4, 1975, Ser. No. 610,146
Claims priority, application Germany, Sept. 9, 1974, 2443042
Int. Cl.² B62B 1/06
U.S. Cl. 280—47.24 5 Claims



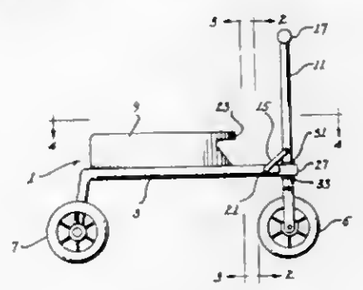
1. A device for the temporary moving of stationary articles, comprising at least one shaft having wheels mounted on both ends thereof, two blocks axially movably arranged on said shaft, each of said blocks having a receiving groove therein for receiving a projection on said article which is to be moved such that said article can be clamped between the receiving grooves in both blocks and can be moved on said wheels, a tension spring anchored between said two blocks, and between the shaft and a hole in each block receiving said shaft therein, there is provided a large clearance, so that the blocks can be positioned inclined for self-locking under the action of said tension spring on the shaft.

4,029,329

CHILD'S THREE-WHEEL SCOOTER

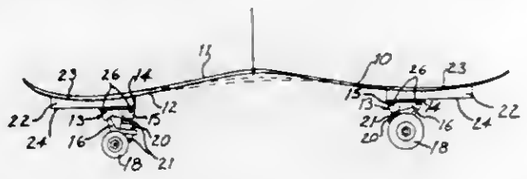
Carter Carl Chambers, P.O. Box 576, Parker, Ariz. 85344

Filed Jan. 19, 1976, Ser. No. 650,407
Int. Cl.² B62K 5/04
U.S. Cl. 280—87.02 R 3 Claims



1. A child's three-wheel scooter having a support bar, two rear wheels depending from said support bar, a knee trough mounted on said support bar, vertically disposed steering column attached to the front end of said support bar, said column having a front wheel on its lower end and two laterally and rearwardly extending projections disposed to engage the support bar when said front wheel has been turned about 45° from straight in either direction.

4,029,330
CAMBERED SKATEBOARD PROVIDED WITH LONGITUDINALLY ADJUSTABLE TRUCK ASSEMBLIES
Paul S. Runyan, Jr., 6658 Electric Ave., LaJolla, Calif. 92037
Filed May 5, 1976, Ser. No. 683,273
Int. Cl.² A63C *17/00*
U.S. Cl. 280—87.04 A **9 Claims**



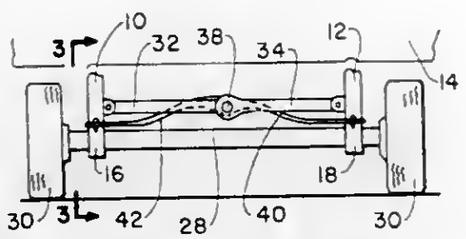
1. In a skateboard having a longitudinally cambered board made from resilient material capable of limited flexing under the weight of a rider, the skateboard having substantially parallel deck and lower surfaces, and front and back longitudinally spaced trucks mounted to its lower surface for carrying a rider along a path selected by application of pressure to the deck surface; the improvement comprising:

first mounting means for permitting longitudinal adjustment of one of the trucks with respect to the board, said first mounting means including:

a rigid track assembly having an upper longitudinal surface complementary to the unweighted configuration of a cambered portion of the lower surface of the board, said track assembly being fixed to said cambered portion in surface-to-surface engagement between the upper surface of the track and the lower surface of the board; and

releasable means operably engaged between said one truck and said track assembly for selectively fixing the longitudinal position of the truck relative to the track assembly.

4,029,331
VEHICLE SUSPENSION SYSTEM
Adolph Richard Obearle, 207 Aero Ave., Schertz, Tex. 78154
Filed Jan. 26, 1976, Ser. No. 652,209
Int. Cl.² B60G *11/00*
U.S. Cl. 280—112 R **5 Claims**



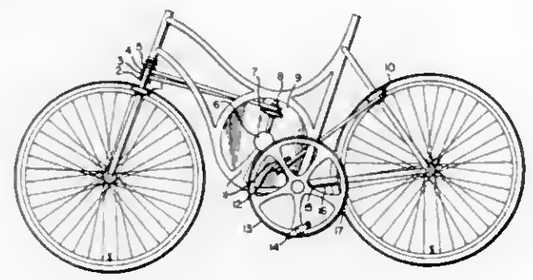
1. A vehicle suspension system comprising:

first and second frame members projecting substantially downwards from a vehicle frame;

first and second axle bearer means attached to said first and second frame members, respectively, for supporting a transverse and normally horizontal axle, the axle having two opposite ends, one wheel being attachable to at least one of said ends;

first and second substantially horizontal and transverse control bars having respective centers and pivotably connected to one another at said centers in a substantially mirror-symmetrical and scissor-type manner, each of said control bars being formed as a leaf spring on one side of said center having an extremity, and a downwardly opening concavo-convex curvature extending at least partly towards said extremity, said leaf springs of said first and second control bars being attached to said second and first axle bearer means near the extremities of said leaf springs, respectively, said first and second control bars having ends on the other side of said center, respectively, each of the latter ends being attached to said first and second frame members, respectively.

4,029,332
ROTACYCLE
Harry C. Davis, 2 Elmwood Ave., Winchester, Mass. 01890
Filed June 10, 1975, Ser. No. 585,751
Int. Cl.² B62M *11/12*
U.S. Cl. 280—234 **4 Claims**



1. A foot propelled two-wheel-in-line vehicular cycle having a structure and comprising:

A. a dual tubed mid-frame as means encompassing and supporting a rotor, said rotor being centrally disposed relative thereto,

B. dual pedal attached driving wheels having a coupling shaft, said shaft revolving in the bottom bracket hanger as means supporting said driving wheels,

C. said driving wheels as means transmitting motion to geared up wheels having a common shaft, said shaft revolving in stationary hubs, said hubs being respectively supported by vertically convergent stanchions, said stanchions being integrated with said mid-frame and said shaft medially mounting said rotor,

D. said rotor constituting a friction disk, said disk being in operative contact with a plurality of pulley wheels equally allocated to both faces of said disk, said pulley wheels' plane of rotation being normal to said disk's plane of rotation,

E. said pulley wheels capable of rotating and traversing on pressure rods, said rods non-coplanar and substantially parallel with said disk's diametral plane, said rods radially disposed relative to the axis of said disk, the inner termini of said rods conveniently mounted on the periphery of said shaft hubs and the outer termini of said rods conveniently mounted on a conventional top tube bridge and on the bottom bracket, and

F. relative to said disk, a lower set of said pulley wheels flexibly connected by endless means to mating wheels mounted on compressive seat stays adjustable conveniently, said mating wheels being thus in friction-tight contact with the sidewalls of the tire as means rotating the rear cycle wheel,

G. an upper set of said pulley wheels similarly connected as means oppositely driving mating wheels mounted on a fork stem extension.

DOUBLE ENDED WAREHOUSE TRAILER
Carl O. Christensen, Alamo, Calif., assignor to Roll-Rite Corporation, Oakland, Calif.
Division of Ser. No. 530,746, Dec. 9, 1974, Pat. No. 3,944,258.
This application Feb. 9, 1976, Ser. No. 656,719
Int. Cl.² B60D *1/00*
U.S. Cl. 280—415 A **5 Claims**

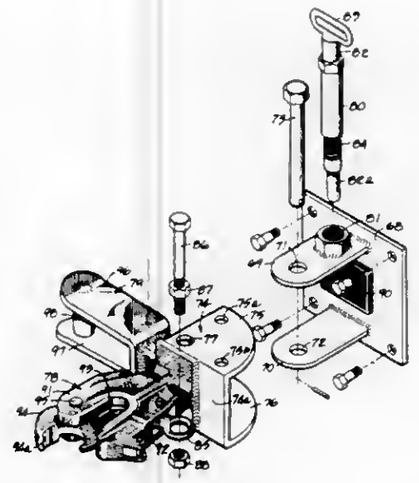
1. An indexing hitch assembly for detachably coupling a pair of vehicles together, comprising:

a base member to be secured to a vehicle, said base member including a pair of vertically spaced-apart brackets extending outward therefrom;

first pin means;

a body member pivotally secured between said brackets by said first pin means, said first pin means extending through said brackets and said body member, said body member including a pair of spaced apart panels defining a top and a bottom connected together by a least a pair of substantially rectangular shaped side panels;

at least first and second coupling members secured to and extending from said body member; said first and second coupling members being secured to said side panels;

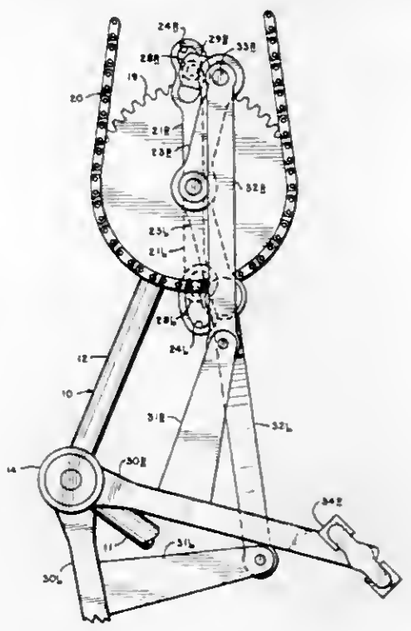


latch means for latching said body member in a plurality of latched positions with respect to said base member, said latch means comprising second pin means mounted on said base member and biased into one of a plurality of apertures in said body member, each aperture corresponding to one of said latch positions; and

said latch positions being oriented such that one of said coupling members is in a position to be coupled to a third coupling member secured to another vehicle in each of said latched positions.

f. the control means including:

1. a cam surface provided on one of the arms, and



2. a cam follower carried by the other of the arms and engaging the cam surface.

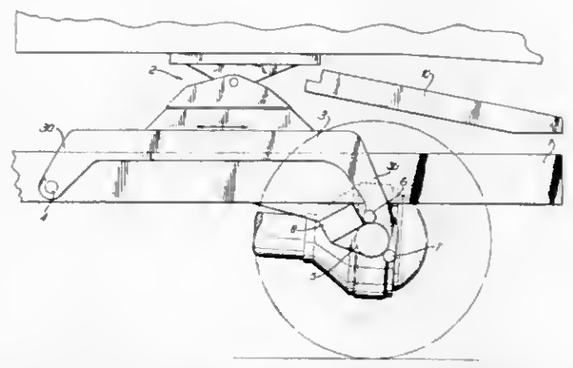
FIFTH WHEELS FOR TRUCK TRACTORS
John Billington Cady, Preston, and Michael John Kellaway, Chorley, both of England, assignors to British Leyland UK Limited, London, England
Filed Mar. 31, 1976, Ser. No. 672,243
Claims priority, application United Kingdom, Aug. 4, 1975, 14303/75
Int. Cl.² B62D *53/08*
U.S. Cl. 280—439 **4 Claims**



1. A truck tractor having the following combination of features:

a. a chassis;

b. a sub-frame;

c. a fifth wheel;

d. means mounting the fifth wheel on the sub-frame;

e. means pivotally connecting the sub-frame to the chassis;

f. an axle for road wheels;

g. means pivotally connecting the axle to the sub-frame so that a proportion of any load on the fifth wheel is carried directly be the axle; and

h. suspension elements interposed between the said axle and the chassis.

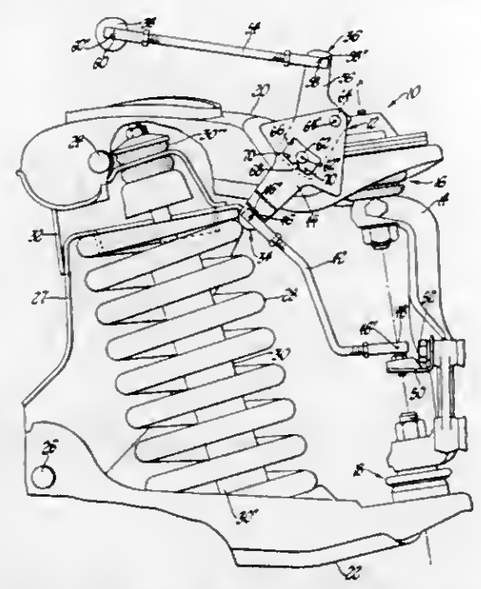
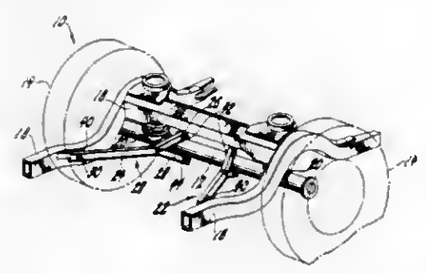
CAMBER INDICATING LINKAGE
Joseph Gerald Bishop, West Bloomfield, Mich., assignor to American Motors Corporation, Detroit, Mich.
Filed Feb. 19, 1976, Ser. No. 659,298
Int. Cl.² B62D 17/00
U.S. Cl. 280—661 15 Claims



1. A wheel camber angle indicating linkage for a vehicle independent suspension system including a control arm pivoted to the sprung mass of the vehicle, and a wheel supporting member supported by the control arm, the linkage comprising: a first linkage portion adapted to extend between the wheel supporting member and the control arm so as to sense the angular relationship between the control arm and the wheel supporting member; a second linkage portion adapted to extend between the control arm and the sprung mass of the vehicle so as to sense the angular relationship between the control arm and the sprung mass of the vehicle; and means for comparing the angular relationships sensed by the first and second linkage portions so as to determine whether the wheel supporting member is angularly oriented so a wheel supported thereby has a camber angle that is proper.

4,029,338
TWIN TRAILING LINK REAR SUSPENSION SYSTEM
David B. Headley, Eaton Rapids, Mich., assignor to General Motors Corporation, Detroit, Mich.
Filed Aug. 13, 1975, Ser. No. 604,345
Int. Cl.² B60G 1/02
U.S. Cl. 280—725 3 Claims



1. In a motor vehicle including a frame having side rails and an interconnecting rear cross-rail, a solid, nonsteerable rear axle having wheels mounted on the opposite ends thereof, and a pair of coil springs mounted between the axle and the frame, the improvement characterized by a rear suspension system including twin trailing links mounted between the rear axle and respective side rails at a predetermined angle with respect to the vehicular longitudinal axis and extending in a direction either fore or aft the rear axle, each of the twin trailing links including a main arm having vertically diverging arms formed on one end thereof, an opening formed adjacent the free end of each of the main and diverging arms, a bushing assembly mounted in each of the openings, fastener means mounted through each of the bushing assemblies for pivotally securing the main arm to the inner surface of the adjacent side rail and for pivotally securing the vertically diverging arms to upper and lower substantially vertically aligned portions of the axle at a predetermined axial location therealong.

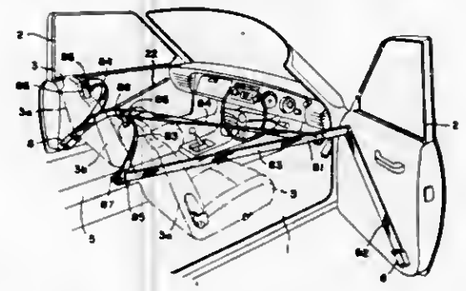
4,029,339
SAFETY BELT DEVICES FOR VEHICLES
Yuichiro Kaneko; Fuminori Teraoka, both of Aichi; Tatsushi Kubota, Kisogawa, and Takehiko Nishikawa, Aichi, all of Japan, assignors to Kabushiki Kaisha Tokai Rika Denki Seisakusho, Japan
Division of Ser. No. 301,796, Oct. 30, 1972, Pat. No. 3,933,369. This application Oct. 30, 1975, Ser. No. 627,379
Claims priority, application Japan, Nov. 4, 1971, 46-87868
Int. Cl.² B60R 21/02
U.S. Cl. 280—745 5 Claims

1. A safety belt device for vehicles, comprising:

a safety belt retractor secured on the inner surface of a door of a vehicle at a location opposite the outer side of a seat adjacent said door, said inner surface of the door having a slit defined therein extending slantingly from the location in which said safety belt retractor is secured to the upper portion of said door;

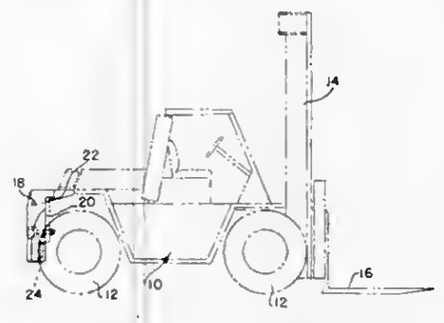
a three point safety belt having a waist belt and a shoulder belt which are branched from a common belt connected at one end to said retractor and extending slantingly from said retractor from the lower to the upper portion of said door, the other end of said waist belt being secured to the central portion of a vehicle body and the other end of said shoulder belt being fixed to the inner portion of the backside of said seat;

a belt driving mechanism provided in the door and comprising a door switch operated by the door opening and closing operation, a motor set in motion upon actuation of said door switch, belt drawing means for drawing said common belt by the drive of said motor, said belt drawing means being in the door substantially along said slit and comprising a gear train connected to said motor and a



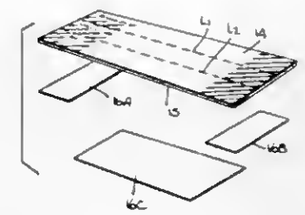
drawing belt having one end fixedly connected to the common belt and the other end connected to the gear train, whereby when the door is closed, said waist and shoulder belts are retracted through said common belt into said retractor and placed in their engaging positions to restrain the waist portion and the shoulder portion, respectively, of a passenger sitting on said seat, and when the door is opened said motor is set in motion so that said common belt is withdrawn from said retractor through said belt drawing means to hold said waist and shoulder belts in their disengaging position.

4,029,340
COMBINED TOWING AND MOUNTING MEMBER FOR VEHICLE COUNTERWEIGHTS
Charles Richard Chelin, Peoria, Ill., assignor to Towmotor Corporation, Mentor, Ohio
Filed Mar. 15, 1976, Ser. No. 666,726
Int. Cl.² B60R 27/00
U.S. Cl. 280—759 5 Claims



4. A counterweight and towing structure for attachment to a vehicle comprising an enlarged counterweight structure including, on one side thereof, a downwardly open hook formation adapted to abut and overlie a part of a vehicle frame and a bore extending through the counterweight structure; and an eye bolt having a threaded shank extending through said bore and adapted to be threadably received by a vehicle frame for securing the counterweight structure to the vehicle frame, the head of the eye bolt serving as a towing eye.

4,029,341
PRINTED FORM HAVING REMOVABLE LABEL
Jimmie D. Neill, Hatboro, Pa., and Lester V. Wise, Old Westbury, N.Y., assignors to Federal Business Products, Inc., New York, N.Y.
Filed Apr. 2, 1976, Ser. No. 672,969
Int. Cl.² B41L 1/24
U.S. Cl. 282—22 R 4 Claims



1. A printed form having an address block thereon for the entry of name and address data regarding the submitter of the form, said form having a label assembly component overlying the address block, making it possible to send material to the submitter in an envelope addressed by a label detached from the assembly, said assembly comprising:

A. a face sheet having an address block thereon corresponding to the block printed on the form, the underside of the face sheet being covered by a pressure-sensitive adhesive layer; and

B. a protective cover sheet laminated to said face sheet by said adhesive layer, said cover sheet being severed into two end section tabs which are adhered to and remain permanently attached to the corresponding end portions of the address block on the form and a relatively long intermediate section having a pressure-responsive duplicating back surface whereby when said data is inserted in the address block on the face sheet, it is reproduced on the printed form, said intermediate section laminated to said face sheet completely covering the adhesive on the underside of the face sheet to form an intermediate laminated portion having adhesive-free edges between said tabs and being readily removable from said form, said intermediate section being thereafter peelable from said face sheet which may then be applied to said envelope.

4,029,342
INTEGRATED RECORD CONTROL SYSTEM AND METHOD
Sidney R. Goodman, 24161 Greenlawn Ave., Beachwood, Ohio 44122
Filed Mar. 26, 1975, Ser. No. 562,095
Int. Cl.² B41L 1/02
U.S. Cl. 282—29 B 7 Claims

1. A closed-loop feed back system of double checking, updating and accurately recording of data between a central location and a remote location comprising the steps of:

at a central location taking a first, overlay member with at least one edge defining a horizontal edge and with one face thereof having an outer row and an inner row generally parallel to said horizontal edge,

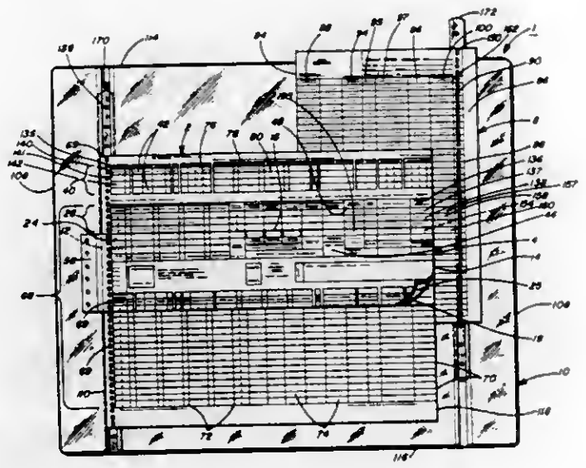
machine printing humanly readable information on at least one predetermined laterally horizontal position of said inner row and in vertical alignment with a blank portion of said outer row,

transmitting said overlay member to a remote location, at said remote location superimposing said overlay member at a laterally horizontally predetermined and vertically selected position on a primary data storage member whereby said blank portion of the overlay member is superimposed over a partially predetermined and partially blank portion of said primary data storage member

with transfer means disposed between the blank portion of said face of the overlay member and the top surface of the primary data storage member,

entering information related to said first mentioned information in said blank portion of the outer row of the overlay member whereby said second mentioned information is automatically transferred to the said blank portion of the primary data storage member,

transmitting the overlay member back to the central location,



at the central location taking a second overlay member and machine printing in humanly readable form the information from the outer row of the first overlay member on the inner row of said second overlay member at the laterally horizontal position corresponding to the laterally horizontal position of the information on the outer row of the first overlay member, and

transmitting said second overlay member to the remote location where it is processed corresponding to the processing at the remote location of the first overlay member.

4,029,343
EXPANSION JOINT FOR PREFABRICATED DOUBLE-WALLED METAL CHIMNEY
Richard L. Stone, Los Altos Hills, Calif., assignor to Wallace-Murray Corporation, Belmont, Calif.
Filed Sept. 23, 1976, Ser. No. 725,873
Int. Cl.² F16L *39/00*
U.S. Cl. 285—47 **7 Claims**

1. An expansion and length adjustment joint for a prefabricated double-walled metal chimney having outer and inner cylindrical chimney walls, comprising:

an upwardly extending end portion of the outer wall of a lower chimney section;

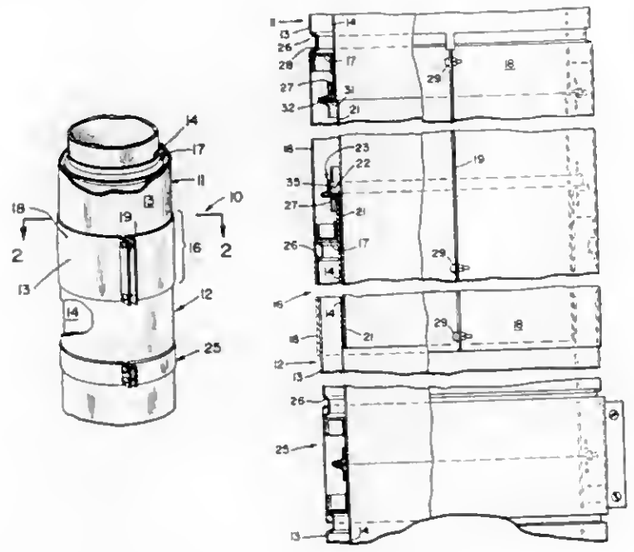
an outer support jacket connected to and extending downwardly from the outer wall of an upper chimney section, overlapping the upwardly extending outer wall end portion for a first selected distance and being closely circumjacent the lower outer wall in the overlapped area and is axially slidable with respect to the latter wall;

an inner slip section connected to and extending downwardly from the inner chimney wall of the upper chimney section;

an upwardly extending end portion of the inner wall of the lower chimney section, overlapping the inner slip section for a second selected distance and lying just outside the slip section in the overlapped area;

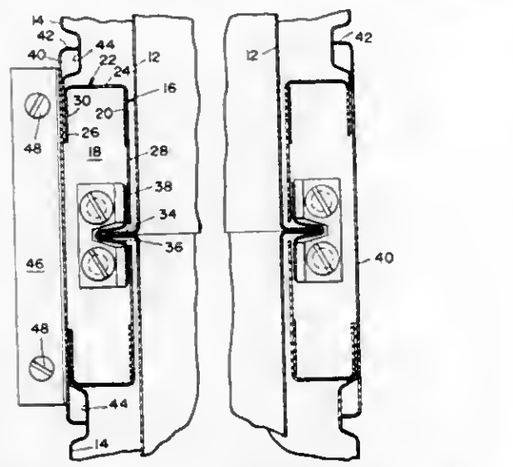
an annular gasket supported by and in sealed engagement with said lower inner wall end portion, and in slidable sealed engagement with the outer surface of the inner slip section; and

means retaining the inner and outer walls of each of the



upper and lower chimney sections a spaced distance apart near the joint.

4,029,344
CONNECTION JOINT FOR PREFABRICATED METAL CHIMNEY
Richard L. Stone, Los Altos Hills, Calif., assignor to Wallace-Murray Corporation, Belmont, Calif.
Filed Sept. 23, 1976, Ser. No. 725,951
Int. Cl.² F16L *39/00*
U.S. Cl. 285—47 **5 Claims**



1. A prefabricated double-walled chimney section adapted to be connected to a similar section to form a chimney column, said section comprising:

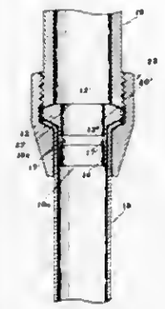
a cylindrical inner imperforate wall member having a radially extending flange at each end;

a cylindrical outer wall member having a greater diameter than and spaced outwardly from said inner wall member, said outer wall member being shorter than said inner wall member so that at least one end edge is spaced above the end flange of said inner wall member;

spacer connector means located between said inner and outer wall members near both ends, each said spacer connector means comprising a circular band portion, a plurality of web portions extending outwardly from circumferentially spaced apart locations on said band portion, outer tab means on each said web portion fixed to said outer wall member and inner tab means extending substantially parallel but unattached to said inner wall member and adjacent to its said radially extending flange;

an inner band means having a flange portion extending around said inner tab means of said spacer connector means and means on the opposite ends of said flange portion for drawing said inner band means tightly around said inner pipe member; and means near said end edge of said outer wall member for retaining a connectable outer band means adapted to extend circumferentially around said outer wall member.

4,029,345
PIPE FITTINGS
Antonio Romanelli, Via A. Omodeo 120, Naples, Italy
Filed May 15, 1975, Ser. No. 577,927
Claims priority, application Italy, May 20, 1974, 51117/74; Apr. 18, 1975, 49191/75
Int. Cl.² F16L *19/04*
U.S. Cl. 285—334.2 **6 Claims**



1. For use in establishing a fluid tight connection, a sealing assembly comprising:

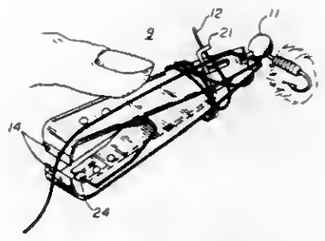
a cylindrical pipe;

a tube having an inwardly-beveled end, said tube being in axial alignment with said pipe;

a first sealing ring having a flanged head including a beveled upper surface, the bevel of which substantially matches the bevel at the end of said tube, a beveled undersurface and a shank tapering inwardly from the beveled undersurface to a short cylindrical portion adjacent the free end of the shank, the surface of said shank diverging slightly from the common axis of said pipe and said tube and the surface of said beveled undersurface diverging sharply from the common axis, the short cylindrical portion of said shank having a lesser outside diameter than the inside diameter of said pipe to facilitate initial, partial entry of the shank into said pipe, said shank including a pipe-flaring annular protruberance which extends outwardly from the shank surface prior to assembly but is deformed inwardly by said cylindrical pipe in the completed assembly, said flanged head and said shank having a hole therethrough; and

a locking nut comprising an annular body having a first hole extending inwardly from one end and a second smaller, axially aligned hole extending inwardly from the other end, the body of said nut having a beveled shoulder at the juncture of the first and second holes, the bevel of the shoulder substantially matching the bevel of the undersurface of the flanged head, said first hole being larger in diameter than the diameter of the flanged head and said second hole being smaller in diameter than the diameter of the flanged head, said nut including means for drawing the nut onto the tube to draw the beveled end of the tube into contact with the beveled upper surface of the flanged head and the end of the pipe initially into contact with the tapered shank and the pipe flaring protruberance, both of which act to flare the end of the pipe to produce a flared pipe surface for mating contact with the beveled undersurface of the flanged head.

4,029,346
LINE THREADER DEVICE
Charles W. Browning, 4645 E. 57th St., Tulsa, Okla. 74135
Filed Oct. 14, 1975, Ser. No. 622,036
Int. Cl.² D03J *3/00*
U.S. Cl. 289—17 **3 Claims**



1. A line threading device for attaching lines to fishing lures comprising

a. A first and a second plate

1. The said first and second plate, each having a cone-shaped indentation extending downwardly from the upper surface of each of the said plates at a first end of each of said plates, the said cone-shaped indentations in each plate nesting each with each other so as to firmly hold the eyelet of a fishing lure and

2. Each of the said cone-shaped indentations having a hole in the apex of the said indentations for easy threading of a fish line through the said eyelet of the said fishing lure;

b. The said first and second plate being connected together by a spring clip;

1. The said spring clip extending from the lower surface of a first said plate to the upper surface of the said second plate so as to provide proper alignment at the said first end of the said first and second plates when the said plates are in a closed position;

c. The said second plate having a Z-shaped spring line holder mounted on the lower surface of the said second plate and extending through an opening in the said first and second plates to the upper surface of the first said plate.

4,029,347
SUPPORT STAND ASSEMBLY
Gilbert Garcia, 4107 San Pedro, Tampa, Fla. 33609
Filed Oct. 8, 1976, Ser. No. 730,847
Int. Cl.² D03J *3/00*
U.S. Cl. 289—18 **9 Claims**

1. A support stand assembly of the type primarily designed to support an article while work is being performed thereon, said support stand assembly comprising: base means disposed in supporting relation to a remaining portion of said support stand assembly, a primary support means comprising a substantially elongated configuration and connected to said base means and extending substantially upwardly therefrom, article retention means including cable means movably attached to a substantially distal portion of said primary suport element and

disposed for attachment to the article, whereby the article may be positioned at various heights along the length of said

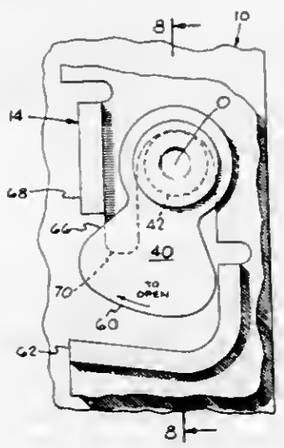
primary support means and at a predetermined position relative to one performing work on the article.

4,029,348

SELF-LOCKING DEVICES

Joseph E. Prather, Bernardsville, and Ramzi A. Khalifa, Rutherford, both of N.J., assignors to Edson Tool and Manufacturing Company, Inc., Belleville, N.J.

Filed Apr. 13, 1976, Ser. No. 676,509
Int. Cl.² E05C 3/04
U.S. Cl. 292—241 16 Claims



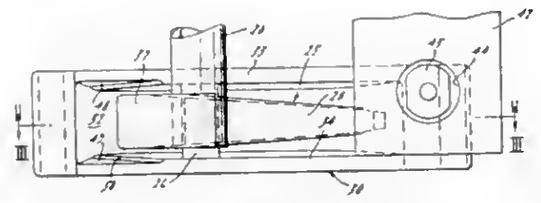
1. A self-locking device for locking a movable structural member to a stationary structural member, or to another movable structural member, or for unlocking the same, comprising: a first structural member; a second structural member which is movable in a first or opening direction; a rotatable self-locking cam; an actuating means capable of rotating said self-locking cam, said rotatable self-locking cam being rotatably mounted on said first structural member; a curved surface on said rotatable self-locking cam, capable of contacting and preventing movement of said second structural member in said first or opening direction; a cam surface on said rotatable self-locking cam, capable of contacting and moving said second structural member in said first or opening direction; an ear on said second structural member, said actuating means being capable of rotating said rotatable self-locking cam in an angular direction, whereby said cam surface on aid rotatable self-locking cam contacts said ear on said second structural membr to forcibly move said second structural member in said first or opening direction, while said curved surface on said rotatable self-locking cam is being simultaneously moved out of the way of said second structural member due to the angular rotation of said rotatable self-locking cam, to permit the movement of said second structural member in said first of opening direction to move and to unlock said second structural member from said first structural member; angular rotation limiting means having surfaces located from about 120° to about 270° and being on said first structural member to limit the angular rotation of said rotatable self-locking cam within a prescribed degree of angularity, said surfaces being located such that said rotatable self-locking cam is always in an operative position when in its open position for selfclosing and locking of said self-locking device, and then, said ear on said second structural member subsequently becoming an actuating means during the closing and locking of said second structural member to said first structural member and being capable of rotating said rotatable self-locking cam in an angular direction opposite to that of said first angular direction, whereby said second structural member returns to its original closed and locked position, wherein it is prevented from movement in said first or opening direction by said curved surface on said rotatble self-locking cam.

4,029,349

DOOR HARDWARE

Adam D. Sweda, Rochester, and Donald M. Wilde, Mount Clemens, both of Mich., assignors to Fruehauf Corporation, Detroit, Mich.

Continuation of Ser. No. 566,244, April 9, 1975, abandoned.
This application Mar. 22, 1976, Ser. No. 668,785
Int. Cl.² E05C 3/14
U.S. Cl. 292—241 7 Claims



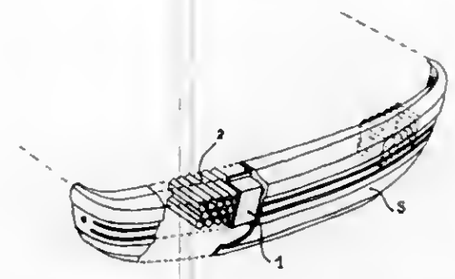
1. Combined fastening and aligning means for a closure which is hinged to a frame, comprising a cam portion and a keeper abutment portion, one of said portions being on the closure and the other portion on the frame, the cam portion being in the general shape of a hooked finger, said cam portion having a free end swingable to and from overengaged holding relation to the keeper abutment portion about an axis parallel to the keeper abutment portion and spaced from such free end, and having surfaces transverse to the pivot axis which converge toward said free end so that said cam portion tapers to reduced thickness toward such free end, a keeper pocket-defining portion having a pair of spaced walls defining reaction portions fixedly appurtenant to the keeper abutment portion and spaced from each other a distance which is not materially greater than the maximum thickness of the cam portion in a direction longitudinally of said axis, said reaction portions being located on one side of said keeper abutment portion and defining an entrance area therebetween, the free end of the cam portion being movable into and out of the entrance area between said walls, whereby one or the other of said surfaces of the cam portion is engageable with one of said reaction portions during the initial part of its inward movement in event of misalignment between the closure and frame, to cam the closure toward realignment with the frame, characterized in that the parts of said surfaces of the cam portion and of said reaction portions which initially engage each other, as the cam portion moves into interposed relation between said reaction portions, extend away from the positions of initial engagement in different non-parallel planes, whereby such initial engagement therebetween is substantially limited to point contact, said walls having continuation portions formed as extensions of said reaction portions and located on the opposite side of said keeper abutment portion from said entrance area, the continuation portions also being spaced apart a distance which is not materially greater than the maximum thickness of the cam portion and lying substantially parallel to the closest surfaces of the cam portion when the cam portion is fully overengaged with the keeper abutment portion.

4,029,350

ENERGY ABSORBING DEVICE

Marcel Goupy, and Pierre Roubinet, both of Boulogne-Billancourt, France, assignors to Regie Nationale des Usines Renault and Automobiles Peugeot, both of Paris, France

Filed Mar. 4, 1975, Ser. No. 555,106
Claims priority, application France, Mar. 5, 1974, 74.07434
Int. Cl.² B60R 19/04
U.S. Cl. 293—71 R 5 Claims



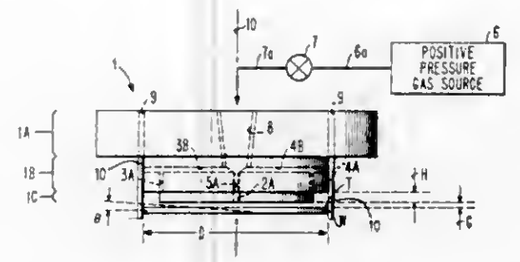
1. An energy absorbing device for use as a composite bumper on a vehicle comprising, in combination, a deformable unit including at least two energy absorbing members, each energy absorbing member formed by the juxtaposition of a plurality of elongated hollow members, said elongated hollow members having parallel longitudinal axes, and a partition extending transversely and perpendicular to the longitudinal axes of said elongated hollow members and located in a selected axial position with respect to said longitudinal axes for connecting said members together, wherein said partition is disposed in a selected axial position intermediate the ends of said deformable unit, an energy absorbing beam supported by said energy absorbing members wherein said elongated hollow members are substantially perpendicular to said energy absorbing beam, and a flexible shield disposed in wrapping relationship with at least a portion of said beam and deformable unit.

4,029,351

BERNOULLI PICKUP HEAD WITH SELF-RESTORING ANTI-TILT IMPROVEMENT

Donald Harlem Apgar, Binghamton, and Richard Fleming Kilburn, Vestal, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed June 2, 1976, Ser. No. 692,068
Int. Cl.² B66C 1/02
U.S. Cl. 294—64 B 10 Claims



1. Pickup apparatus of the Bernoulli type for lifting an article for support thereby, said article having a predetermined planar surface, said apparatus comprising:

a pickup head,

central main orifice means disposed on said pickup head and adapted to be coupled to a positive pressure gas supply, said main orifice means providing a gas flow discharge therefrom towards said predetermined planar surface for effecting the lifting and support of said article, and

at least three auxiliary orifice means disposed on said pickup head in a predetermined symmetrical manner about said main orifice means and adapted to be coupled to a positive pressure gas supply, said auxiliary orifice means providing gas flow discharges therefrom towards said predetermined surface for effecting a restoring torque to said article whenever said planar surface becomes tilted in any direction with respect to said pickup head.

4,029,352

FOLDABLE HAND RAIL

Lee T. Evans, Canon City, Colo., assignor to Lee T. Evans and Luella Evans, both of Canon City, Colo.

Filed Apr. 7, 1976, Ser. No. 674,617
Int. Cl.² B60B 3/36; E04H 17/14
U.S. Cl. 296—23 R 6 Claims

1. A foldable hand rail assembly to be placed alongside the side entrance of a camper trailer and comprising, in combination therewith:

a. a first bracket affixed to the side wall of the trailer alongside the trailer entrance and at a suitable height above the floor of the trailer for holding the top end of a hand rail;

b. a hand rail pivotally mounted upon said first bracket to hang therefrom alongside the trailer wall whenever it is retracted, but to swing outwardly therefrom whenever it is extended;

c. a second bracket affixed to the side wall of the trailer below the first mentioned bracket at a height near the floor of the trailer; and

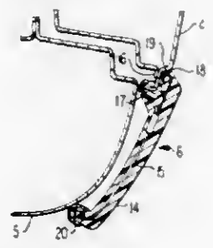
d. a strut below the hand rail pivotally connected to said second bracket to upstand alongside the trailer wall when it is retracted and to swing outwardly therefrom to engage and support the hand rail at its extended position.

4,029,353

MOTOR VEHICLE, ESPECIALLY PASSENGER MOTOR VEHICLE WITH AT LEAST ONE DOOR ON EACH SIDE

Béla Barényl, Maichingen; Heinrich Haselmann, Sindelfingen, and Egon Rieth, Boblingen, all of Germany, assignors to Daimler-Benz Aktiengesellschaft, Germany

Filed Mar. 26, 1975, Ser. No. 562,096
Claims priority, application Germany, Mar. 30, 1974, 2415534
Int. Cl.² B60J 5/04
U.S. Cl. 296—28 R 11 Claims



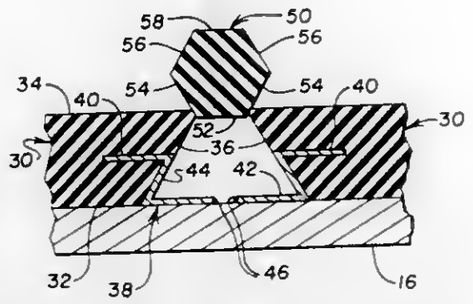
1. A motor vehicle with at least one door on each vehicle side, a door opening for receiving each door, a longitudinal bearer means delimiting a bottom of each door opening, characterized in that a shield means is provided at each door, said shield means with a closed door covers the longitudinal bearer means at least in its upper area and abuts with its edges at the longitudinal bearer means, the shield means is pivotally mounted at a lower edge of each door, and in that said shield means is stressed with a spring force in the direction toward the longitudinal bearer means.

4,029,354

PROTECTIVE STRIP OVERLAY FOR TRUCK BOXES

William J. Valeri, Hibbing, Minn., assignor to Irathane Systems Incorporated, Hibbing, Minn.

Filed Jan. 21, 1976, Ser. No. 651,063
Int. Cl.² B62D 33/00
U.S. Cl. 296—28 D 15 Claims



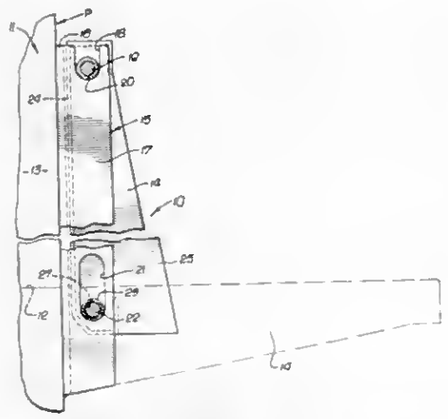
1. A protective overlay system for a metal truck box comprising a plurality of blocks of impact-resistant material having one face confronting the truck box surface to be protected, adjacent blocks being laterally spaced so as to provide an elongated slot therebetween, and anchor means for each block having a first portion thereof secured to its block and a second portion extending from its said block, said second portions of adjacent anchor means being laterally spaced and said second portions being welded to the surface to be protected, said slot in each instance providing access to said surface in order to permit the welding of said laterally spaced second portions.

4,029,355

TRUCK BODY TAIL GATE

Irven R. Wilhelmsen, 6359 Dominica St., Cypress, Calif. 90630

Filed Sept. 29, 1975, Ser. No. 617,424
Int. Cl.² B62D 25/00
U.S. Cl. 296—57 R 2 Claims



1. In a tail gate structure adapted to be applied as a unit exclusively to a transverse vertical plane provided by the rear end faces of the side walls of the bed of a truck service body, the combination of:

a pair of vertical right angle sheet metal brackets having primary aligned webs extending inwardly and secured by welding means to said side wall end faces and having parallel secondary webs extending rearwardly from outer edges of said primary webs, said secondary webs having a pair of aligned notches in their upper ends and a pair of aligned slots near their lower ends;

a rectangular tail gate formed of sheet metal to fit between said secondary webs and having upwardly tapered parallel sheet metal flanges welded to its opposite ends, the latter flanges being bolt-hole apertured opposite said notches and slots; and

two pair of bolts with spacing sleeves, said bolts penetrating said apertures with said sleeves extending through and occupying said notches and slots in said secondary webs,

said tail gate being supported vertically by said bolts, the upper bolts being liftable from said notches to permit the tail gate being swung downward into horizontal rearward extension of said truck bed, the tail gate being supported in its lower horizontal position by said lower pair of bolts and by the wide lower ends of said tapered end flanges abutting flush against lower end portions of said vertical primary bracket webs.

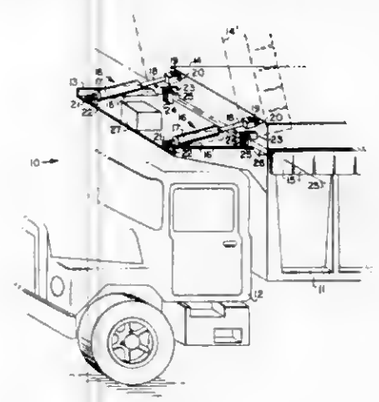
4,029,356

TRUCK BODY CLOSURE

Norris R. Hoch, Largo, Fla., assignor to Jeff-Ko Manufacturing Co., Inc., Milwaukee, Wis.

Division of Ser. No. 454,728, March 25, 1974, Pat. No. 3,913,969. This application Oct. 16, 1975, Ser. No. 622,885
Int. Cl.² B60P 7/02
U.S. Cl. 296—137 B 1 Claim

1. In a method of opening a closure which extends laterally when closed and upwardly when open and in which hydraulic fluid under pressure is supplied to hydraulic means to open the closure, the step of adjusting said pressure to a value such that the pressure is insufficient to open said closure if the weight of a human being is provided as a substantial downward force



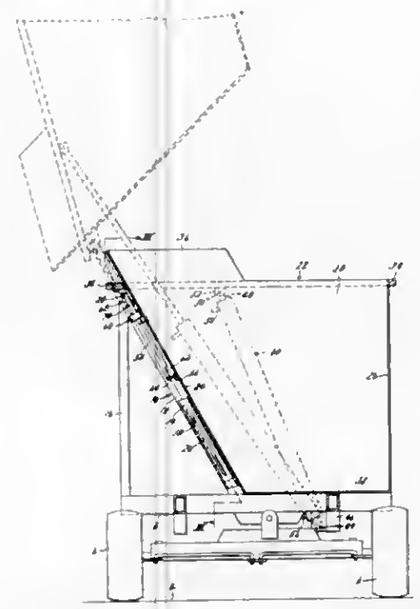
extraneous to the weight of the closure as a safety measure to prevent damage to said human being.

4,029,357

STRUT EXTENSION LOCK FOR DUMP TRUCKS

Jerald W. Bishop, Osborne, Kans., assignor to Gilmore-Tatge Manufacturing Co., Inc., Clay Center, Kans.

Filed Oct. 28, 1975, Ser. No. 626,249
Int. Cl.² B60P 1/34
U.S. Cl. 298—11 3 Claims



1. In combination with a dump truck including a wheeled bed, slidably extensible struts having a limited degree of extensibility fixed to said bed and extending upwardly therefrom, each of said struts including two slidably telescoped sections, a dump bucket normally resting on said bed and pivoted along one of its upper edges on a horizontal axis to the upper ends of said struts, and power means operable to exert an upward force on said bucket intermediate the vertical planes of its pivotal axis and its center of gravity, whereby said bucket is first elevated in an upright position to the limit of the extensibility of said struts, and then tilted about its pivotal axis to a dump position wherein its weight causes a reversal of the tensile load on said struts to a compressive load, a strut extension lock operable to prevent retraction of said struts under said compressive load, said lock comprising:

a. a locking bar pivoted to one of the sections of said strut on a transverse axis and extending longitudinally of said strut to coextend with a portion of the other section of said strut, a tubular keeper affixed to said other strut section, said locking bar extending slidably through said keeper, said locking bar having a notch formed in a longitudinal edge thereof, said notch being positioned to be brought within said keeper only when said strut is fully extended, and resilient means urging said locking bar pivotally in a direction to move a shoulder of said bar notch into abutting alignment with the end of said keeper facing said one strut section, whereby to lock said strut against longitudinal retraction, and

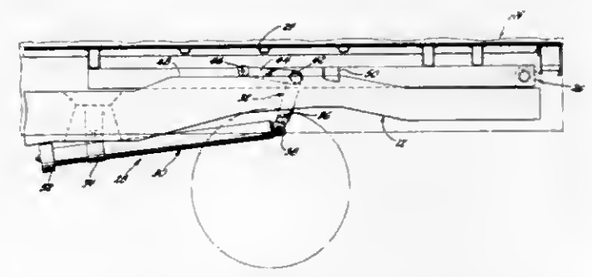
b. control means operable selectively to engage and disengage said extension lock, said control means being operable selectively to restrain said locking bar to a position coaxial with said keeper, against the pressure of said resilient means, or to release said locking bar for movement by said resilient means.

4,029,358

REAR DUMP OPERATING MECHANISM

Paul F. Bergdolt, Frankenmuth, Mich., assignor to General Motors Corporation, Detroit, Mich.

Filed July 29, 1976, Ser. No. 709,785
Int. Cl.² B60P 1/28
U.S. Cl. 298—19 B 3 Claims



1. In combination with a vehicle having a frame supporting a dump body for pivotal movement about a transverse horizontal axis, an operating mechanism for pivoting the dump body about said transverse axis between a lowered position and a fully raised position, said operating mechanism including a bell crank member having a pair of arms, means connecting said bell crank member to said dump body for pivotal movement about an axis parallel to said transverse horizontal axis, a track fixed to said frame and extending longitudinally thereof, one arm of said bell crank member adapted to move along said track, a linear drive transmitting means supported adjacent one end thereof by said frame and pivotally connected at the other end to the other of said arms, and a motor drivingly connected to said linear drive transmitting means, the arrangement being such that when the dump body is in the lowered position actuation of the motor causes the bell crank member to be rotated about its support means so that said one arm moves along the track and causes the dump body to be raised to a partially raised position after which said other of said arms contacts the underside of the dump body to complete the raising of the dump body to the fully raised position.

4,029,359

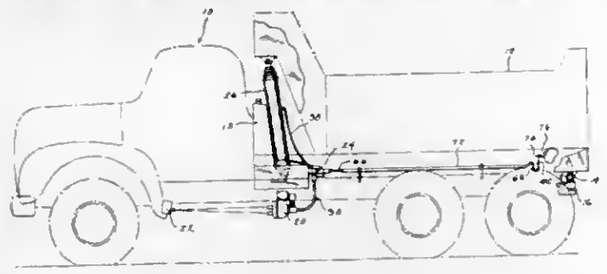
SAFETY APPARATUS FOR HYDRAULIC VALVES IN DUMP BODY MECHANISMS

Norman J. Glomski, Milwaukee, Wis., assignor to The Heil Co., Milwaukee, Wis.

Filed Apr. 30, 1975, Ser. No. 572,989
Int. Cl.² B60P 1/16
U.S. Cl. 298—22 C 9 Claims

1. In a dump body mechanism having a tiltable dump body and having means including a hydraulic cylinder for raising and lowering the body, there being a hydraulic circuit for said cylinder including an hydraulic pump and a return line, and there being a valve in said circuit for controlling the flow of hydraulic fluid into and out of said hydraulic cylinder, said valve including a housing and shiftable control member having a raise position in which hydraulic fluid is routed from said

pump to said hydraulic cylinder to operate the cylinder to raise the dump body, and having a neutral position in which hydraulic fluid is bypassed around said hydraulic cylinder to hold the body in a raised position, there being means in said circuit permitting said raising and the holding in raised position, and said shiftable control member having a lower position in which hyraulic fluid is routed from said hydraulic cylinder to said return line to operate said hydraulic cylinder to lower the dump body, there being means for selective shifting of said control member, and there being a flexible



force transmitting member connected between said tiltable dump body and said movable valve control member to automatically shift the valve control member from its raise position to its neutral position when said dump body approaches its uppermost position, the improvement comprising relatively movable means connected to said valve control member said valve housing, and to said force transmitting member for preventing an inadvertent pull on said force transmitting member from being transmitted to the valve control member when the latter is in neutral position to prevent accidental lowering of said dump body.

4,029,360

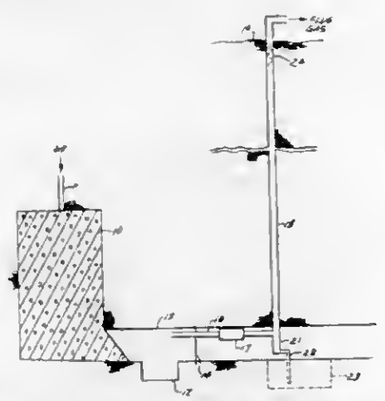
METHOD OF RECOVERING OIL AND WATER FROM IN SITU OIL SHALE RETORT FLUE GAS

Gordon B. French, Rifle, Colo., assignor to Occidental Oil Shale, Inc., Grand Junction, Colo.

Continuation of Ser. No. 492,598, July 26, 1974, abandoned. This application Apr. 2, 1976, Ser. No. 672,874

Int. Cl.² E21C 41/10; E21B 43/00

U.S. Cl. 299—2 5 Claims



1. A method of reducing the water content of flue gas from an underground in situ oil shale retort in a subterranean formation containing oil shale comprising the steps of:

collecting flue gas from an underground in situ retort, said flue gas having water vaporized therein;

passing the flue gas through an elongated conduit extending through at least one subterranean rock formation in heat transfer relationship with at least one such rock formation for a sufficient distance to lower the flue gas temperature to a temperature of less than the dew point of the collected flue gas for condensing water from the flue gas, at least a portion of such a rock formation having a temperature at the conduit of less than the dew point of said flue gas; and

recovering water condensed from the flue gas from the elongated conduit.

4,029,361

LONGWALL MINING ROOF SUPPORT FOR DOUBLE DECK MACHINES

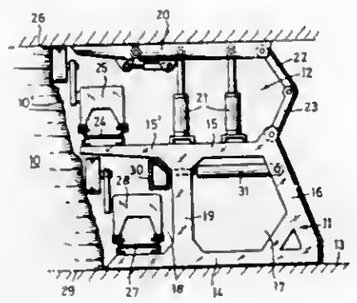
Klaus Beckmann, and Heinrich Behr, both of Lunen, Germany, assignors to Gewerkschaft Eisenhutte Westfalia, Wethmar near Lunen, Germany

Filed Mar. 4, 1976, Ser. No. 663,647

Claims priority, application Germany, Mar. 6, 1975, 2509810

Int. Cl.² E21D 15/44

U.S. Cl. 299—31 14 Claims



1. A mineral mining installation for use with a thick-seam mineral face; said installation comprising a plurality of support units each having a rigid underframe with a floor part resting on the floor of the working, a roof part and rear and intermediate structures interconnecting the roof and floor parts to define an access chamber between the roof and floor parts remote from the mineral face and a winning chamber adjacent the mineral face, the roof part extending at least over the entire area of the access chamber, and each support unit having an upper frame constituted by hydraulic props supported on the roof part of the underframe and carrying a roof girder engageable with the roof of the mine working, wherein means are provided for supporting and guiding a winning device in both the winning chamber and the face side region of the upper frame.

4,029,362

ARRANGEMENT FOR HYDRAULICALLY CONVEYING SOLIDS

Werner Kortenbusch, Lunen, Germany, assignor to Ruhrkohle AG, Essen, Germany

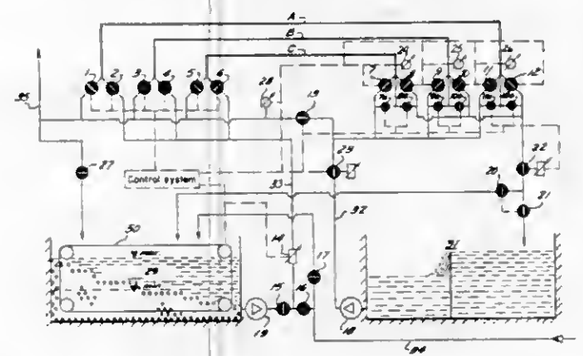
Filed Dec. 8, 1975, Ser. No. 638,563

Claims priority, application Germany, Dec. 7, 1974, 2457943

Int. Cl.² B65G 53/30

U.S. Cl. 302—14 11 Claims

1. In an arrangement for hydraulically conveying solids, especially coarse solids, which includes a plurality of chambers which are to be sequentially charged with solids-containing slurry at low pressure and from which slurry is to be sequentially discharged at high pressure into a discharge conduit by a pressurized hydraulic fluid, a plurality of supply conduits which conduct the slurry and the pressurized hydraulic fluid from respective sources thereof toward said chambers, a plurality of valves which are movable between respective open positions for establishing and closed positions for interrupting flow of the slurry and of the pressurized hydraulic fluid into and out of the respective chambers, and means for moving said valves between said closed and open positions thereof, the improvement comprising means for equalizing the pressures in said chambers with those in said supply conduits; and means for sequentially controlling the operation of said pressure-equalizing means and of said moving means of said valves to simultaneously charge at least one of said chambers with low-pressure slurry and discharge high-pressure slurry from at least one other chamber into said discharge conduit, including means for sensing the conditions prevailing at least in some of



said supply and discharge conduits and for generating signals representative of such sensed conditions, and means for sequentially actuating first said pressure equalizing means and then said moving means of said valves in dependence on said signals.

4,029,363

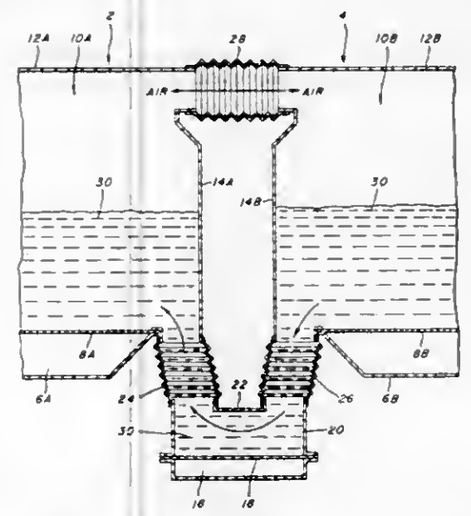
FLEXIBLE JUNCTION IN A SYSTEM FOR FLUIDIZING GRANULAR MATERIALS

Richard L. Lowe, Glenshaw, Pa., assignor to Aluminum Company of America, Pittsburgh, Pa.

Filed Aug. 5, 1976, Ser. No. 711,955

Int. Cl.² B65G 53/52, 53/20

U.S. Cl. 302—29 6 Claims



1. In a system for fluidizing granular materials including primary enclosures having permeable floors therein and means for supplying a fluidizing medium upwardly through said floors, a flexible junction connecting said primary enclosures comprising:

a secondary enclosure spaced between and at a lower elevation than the primary enclosures, having a permeable floor and means for supplying a fluidizing medium upwardly through the permeable floor; and

juxtaposed flexible tubes connecting the secondary enclosure with each of the primary enclosures, the connection with the primary enclosures located contiguous to the end of the permeable floor in each primary enclosure.

4,029,364

DEVICE FOR LOADING AIR WITH A CONTROLLABLE AMOUNT OF A GRANULAR OR POWDERY MATERIAL

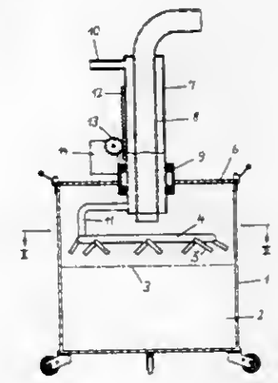
Roman Saizer, Inzersdorf, Austria, assignor to Interliz Anstalt, Vaduz, Liechtenstein

Filed Sept. 5, 1975, Ser. No. 610,907

Claims priority, application Austria, July 7, 1975, 95233/75

Int. Cl.² B65G 53/16

U.S. Cl. 302—34 3 Claims



1. A device for loading a stream of air with a controllable amount of granular or powdery material comprising a container having a cover, said material being disposed in said container with a free space being provided between the upper surface of said material and said cover, an annular conduit disposed in a general plane which is substantially horizontally disposed, said annular conduit being spaced from the wall of the container and having a plurality of nozzles disposed in said free space, said nozzles extending approximately tangentially relative to said annular conduit, a double tube means vertically and slidably mounted on said cover, sealing means slidably sealing said double tube means on said cover, driving means for raising and lowering said double tube means, said double tube means comprising a pair of tubes, one of said tubes carrying said annular conduit, a connection connecting said one tube to a source of compressed air for supplying compressed air to said annular conduit, the other tube having a lower end disposed within said free space in said container, said lower end of said other tube being disposed substantially aligned with the center of said annular conduit and at a level substantially at the general plane of said annular conduit to receive air laden with said material which has been blown and churned-up by the compressed air discharged into said container by said nozzles on said annular conduit.

4,029,365

METHOD FOR FEEDING POWDERED MATERIAL

Norbert Ahrens, Oelde; Heinrich Klockenbusch, Ahlen; Horst Ritzmann, Enniger; Hans Klein, Beckum; Gerhard Balzau, Neubeckum, and Clemens Schnuckel, Stromberg, all of Germany, assignors to Polysius AG, Neubeckum, Germany

Filed Dec. 22, 1975, Ser. No. 643,097

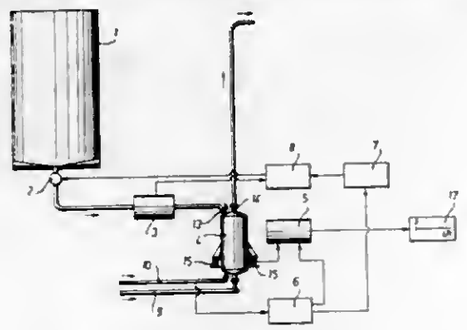
Claims priority, application Germany, Dec. 27, 1974, 2461579

Int. Cl.² B65G 53/66

U.S. Cl. 302—35 1 Claim

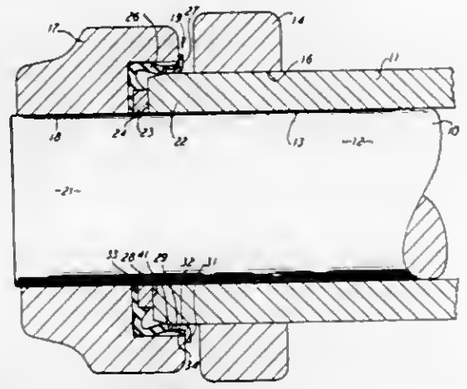
1. A method of controlling continuously the output of powder material from a vertical, pneumatic conveyor having a material inlet, a material outlet, and a porous base, said method comprising introducing material from a container therefor to said conveyor via said inlet at a predetermined initial rate; establishing a discharge gas stream between said base and said outlet for discharging material from said conveyor; introducing a fluidizing gas under pressure independently of paid discharge gas to said base for loosening material

thereon; continuously measuring the pressure of said fluidizing gas; and increasing and decreasing the rate of introduction



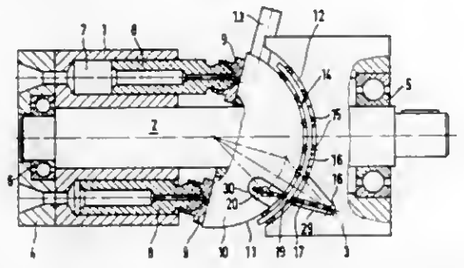
of material to said conveyor according to decreases and increases, respectively, in the pressure of said fluidizing gas.

4,029,366
SEALED TRACK CHAIN JOINT
John Merlin Baylor, Bettendorf, Iowa, assignor to J. I. Case Company, Racine, Wis.
Filed June 24, 1976, Ser. No. 699,259
Int. Cl.² B62D 55/20; F16J 15/34
U.S. Cl. 305—11 9 Claims



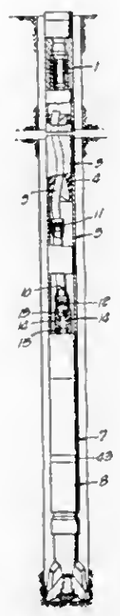
1. A sealed track chain joint comprising a track pin, a cylindrical bushing extending over the intermediate length of said pin and being rotatable thereon and with said pin having its axial end extending beyond the axial end surface of said bushing, a chain link member on said pin axial end spaced from said bushing end surface, a chain link member on the axial end of said bushing and spaced from said end surface whereby said chain link members are disposed to be spaced apart on opposite sides of the plane of said bushing end surface, a washer on said pin and disposed between said end surface and said link member on said pin and being in sealing relation with said pin, and a seal including an elastomeric member attached to said washer and extending therefrom and across the plane of said bushing end surface and to the outer diameter of said bushing and being in sealing relation with said washer and said bushing for presenting an elastomeric seal for said intermediate length of said pin and said bushing.

4,029,367
BEARING SUPPORTING A SWASHPLATE OF A HYDRAULIC AXIAL CYLINDER MACHINE
Franz-Josef Schwede, and Ingo Valentin, both of Ulm, (Danube), Germany, assignors to Hydromatic GmbH, Germany
Filed Apr. 21, 1976, Ser. No. 679,052
Claims priority, application Germany, May 13, 1975, 2521312
Int. Cl.² F16C 7/00
U.S. Cl. 308—2 R 6 Claims



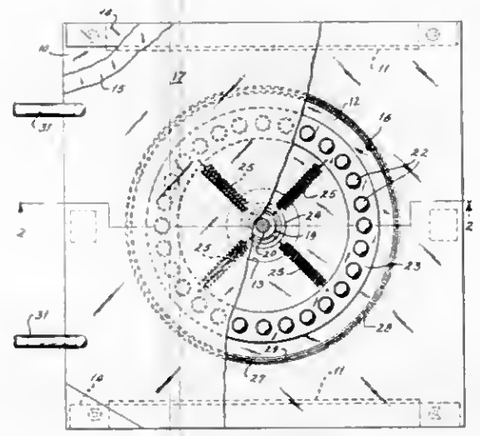
1. In a hydraulic axial cylinder machine of the kind having a concave cylindrical bearing face in the machine casing, a corresponding convex cylindrical bearing face on the swashplate, and an arcuate bearing cage with rolling contact bearing elements contained within the cage and disposed in the space between said concave and convex bearing faces, the improvement comprising, follow-up guide means for positively displacing the bearing cage to a theoretically correct position on each change of tilt of the swashplate, said guide means comprising a rod, a first pivotal connection between the rod and the swashplate, a second pivotal connection between the rod and the casing, and wherein the rod is linked to the bearing cage so that the bearing cage is always urged into a position on the line connecting the first and second pivotal connections.

4,029,368
RADIAL BEARINGS
John E. Tschirky, Long Beach, and Gary Monroe Crase, Cypress, both of Calif., assignors to Smith International, Inc., Newport Beach, Calif.
Continuation-in-part of Ser. No. 388,586, Aug. 15, 1973, Pat. No. 3,879,094. This application Jan. 27, 1975, Ser. No. 544,143
Int. Cl.² F16C 19/00
U.S. Cl. 308—8.2 20 Claims



1. In combination, a housing member, a shaft member, a radial bearing mounted between the housing member and the shaft member, said radial bearing including a sleeve member comprising matrix bonded hard particles, a complementary bearing member comprising matrix bonded hard particles mounted in said bearing in bearing relationship with said sleeve, passageways extending through one of said members.

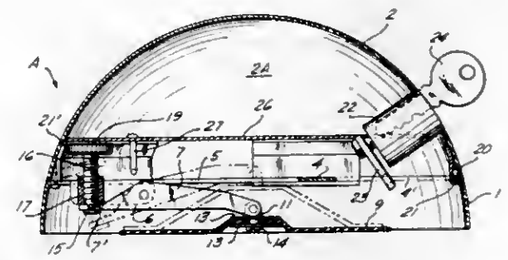
4,029,369
TURN PLATE DIRT SEAL
Lee Hunter, Ladue, and Joseph J. Jasso, St. Louis, both of Mo., assignors to Hunter Engineering Company, Bridgeton, Mo.
Filed Apr. 5, 1976, Ser. No. 673,416
Int. Cl.² B60B 35/00
U.S. Cl. 308—36.1 4 Claims



1. A turn plate supporting a vehicle wheel requiring turning in place, said turn plate comprising a flat base plate formed with a bearing race on its upwardly presented surface area surrounding a central opening, an anchor post movable relative to said base and projecting upwardly in said central opening in said bearing race, bearing means surrounding said post and supported on said bearing race for orbital movement about said post, means connecting said bearing means and post and restraining said bearing means to limited orbital movement on said bearing race, a top plate having an upper surface and a bearing race on its downwardly presented surface, said top plate being connected to said anchor post in position to be engaged by the vehicle wheel on its upper surface and with its downwardly presented race engaged on said bearing means, said bearing means holding said base and top plates in spaced relation, and dirt seal means engaged by and disposed between said bearing races and surrounding said bearing means to exclude dirt from an area of said bearing races witnin which said bearing means has its limited orbital movement.

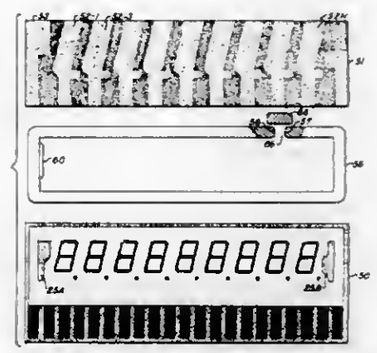
4,029,370
PORTABLE SAFE
Olivier Ziegel, and Liliane Ziegel, both of 66, Boulevard Malesherbes, 75008 Paris, France
Filed Sept. 26, 1975, Ser. No. 617,183
Claims priority, application France, Oct. 2, 1974, 74.33167; July 25, 1975, 75.23289
Int. Cl.² A47B 97/00; F16B 47/00; E05G 1/04
U.S. Cl. 312—284 14 Claims

1. A portable safe comprising, a base, a suction mounted in said base and having a suction surface directed outwardly from the base for engagement with a smooth support surface for securing the base to said smooth support surface, a cover for said base, said cover and base having cooperating means for removably securing the cover to the base, and cooperating to define a chamber within said safe, lock means for locking the cover to the base, and means mounted entirely within said chamber in the confines of said base and accessible only upon removal of said cover for selectively displacing the center of the suction cup inwardly of the base thereby to stretch the



suction cup and produce a strong gripping force on the support surface.

4,029,371
METHOD OF MANUFACTURING GAS DISCHARGE DISPLAY PANELS
George A. Kupsky, State College, Pa., assignor to Panel Technology, Inc., Lewistown, Pa.
Continuation of Ser. No. 513,803, Oct. 10, 1974, abandoned. This application July 23, 1976, Ser. No. 708,157
Int. Cl.² H01J 9/385, 9/395
U.S. Cl. 316—19 2 Claims



1. A batch process for making a plurality of gas discharge information display panels in each of which a pair of rigid flat plates define parallel flat boundaries each flat plate having electrodes thereon between which information to be displayed is generated by plural discrete gas discharges between selectively energized electrodes on said flat plates, said information display panels being sealed in groups by

A. applying a heat fusible glass frit in a pattern defining a lateral perimeter boundary of the gas chamber to one of said flat plates, a space being left in said glass frit pattern forming a vacuumization and gas fill port,

B. aligning said flat plates in an unfused assembly with the electrodes on the respective plates opposite each other in their desired information display positions, respectively,

C. heating said aligned electrode substrates to a temperature to fuse said heat fusible glass frit and join said flat plates in assembly with said gas fill port remaining open,

D. with said port in an up position relative to said gas chamber positioning a fusible plug between said pair of flat plate members and bridging said vacuumization and said gas fill port,

E. stacking together in a tray a plurality of assembled pairs of flat plates as formed by steps A-D with said gas fill port up and said fusible plug in place thereat,

F. simultaneously treating all the display panels in the stack by vacuumizing and gas filling the chambers via the respective ports thereof,

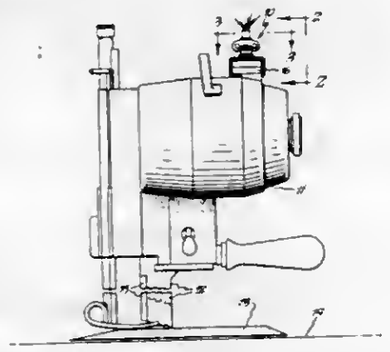
G. and then simultaneously fusing said fusible plug to said pair of flat plates and glass frit pattern bounding said port to seal the gas in each said gas chamber respectively of each flat gas discharge information display panel.

4,029,372

GROUNDING ATTACHMENT PLUG AND TERMINAL BLOCK ASSEMBLY FOR CLOTH CUTTING MACHINE

Frederick G. Clark, Naples, Fla., assignor to Eastman Machine Company, Buffalo, N.Y.

Filed Aug. 24, 1976, Ser. No. 717,282
Int. Cl.² H01R 3/06
U.S. Cl. 339—14 R 11 Claims



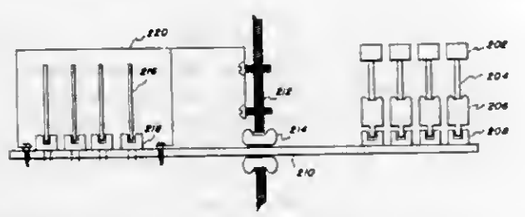
1. A combined prong shield and grounding construction for an electrical plug associated with a metal motor housing comprising a first plug section having longitudinal prong means extending therefrom, a metal prong shield including a tab, screw means extending through said tab and said first plug section and into said metal motor housing, said prong shield including a protective shell surrounding said longitudinal prong means and spaced therefrom, a second plug section, receptacle means in said second plug section for receiving said longitudinal prong means with a sliding fit, said second plug section having an outer configuration for being received in said protective shell, a grounding connection on said second plug section, a grounding post in electrical contact with said grounding connection, said grounding post extending in a direction substantially perpendicularly to said longitudinal prongs, clamp means mounted on said grounding post, slot means in said protective shell, said slot means being substantially parallel to said longitudinal prong means for receiving said post means when said receptacle means are slid over said prong means, spring means biasing said clamp means toward said second plug section and into engagement with said shell incidental to the entry of said post means into said slot means, whereby grounding is effected automatically upon connecting of said first and second plug sections.

4,029,373

MEANS FOR WIRING INTO A SEALED ENCLOSURE

Gleo D. Jones, Orange, and Michael J. Raffetto, Palos Verdes Peninsula, both of Calif., assignors to Xerox Corporation, Stamford, Conn.

Filed Aug. 3, 1973, Ser. No. 385,356
Int. Cl.² H05K 1/02
U.S. Cl. 339—17 R 6 Claims



1. Apparatus for wiring through the wall of a sealed enclosure comprising:

a printed circuit board extending through a slot in said wall, said printed circuit board having a plurality of etched conductors extending from an area of said board inside said enclosure to an area of said board outside said enclosure,

means mounted on said printed circuit board and electrically connected to the ends of said etched conductors for providing electrical connections to said etched conductors, and

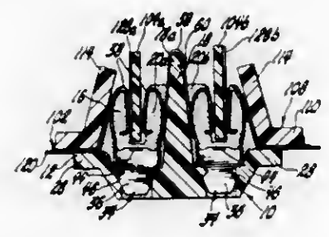
means for sealing the space between said wall and said printed circuit board.

4,029,374

ELECTRICAL CONNECTOR FOR PRINTED CIRCUITS

Charles R. Nestor, Niles, and John A. Yurtin, Southington, both of Ohio, assignors to General Motors Corporation, Detroit, Mich.

Filed May 24, 1976, Ser. No. 689,083
Int. Cl.² H05K 1/07
U.S. Cl. 339—17 F 4 Claims



1. An electrical connector for electrically connecting flexible and hardboard printed circuits comprising:

a connector body having a base and a plurality of generally parallel partition walls perpendicularly disposed thereon to define at least one row of terminal receiving cavities,

each of said terminal receiving cavities having a top opening at an end thereof remote from said base and side opening communicating with the top opening,

each partition wall having a slot extending from an end surface thereof toward said base, said slots being aligned and generally perpendicular to said base and together with a central portion of each of said cavities including said top openings forming a slot means for receiving a hardboard printed circuit with different portions thereof disposed in each of said cavities, and

a transition terminal secured in each of a number of said cavities, each said transition terminal comprising a body having a pair of U-shaped arms having remote resilient legs connected to the body in a cantilevered fashion and confronting resilient legs protruding into said central portion of said one cavity for engaging opposite faces of a hardboard printed circuit received in said slot means, each said transition terminal further having one of said remote resilient legs in its free unbiased state extending outwardly of one of said cavities through the side opening thereof and beyond a side surface of said connector body defined by coplanar side end surfaces of said partition walls whereby said transition terminal is adapted for biased engagement with a deflectable flap portion of a flexible printed circuit when said connector body is plugged into a panel aperture.

4,029,375

MINIATURE ELECTRICAL CONNECTOR

Henry Gabrielian, Newport Beach, Calif., assignor to Electronic Engineering Company of California, Santa Ana, Calif.

Filed June 14, 1976, Ser. No. 696,109
Int. Cl.² H05K 1/12
U.S. Cl. 339—17 M 11 Claims

1. An electrical connector, comprising;

a. an insulative housing (1) having plural apertures,

each said aperture having an axial portion of large transverse extent (2)

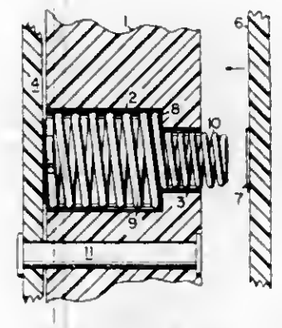
and a lesser axial portion of smaller transverse extent (3),

b. an electrically conductive helical wound resilient element (9,10;) within each said aperture,

each said resilient element having portions of different transverse area extent proportional to the area of portions (2,3) of said apertures in which they are located, resilient over the full axial extent thereof,

and of a slightly lesser transverse extent to allow free axial movement of each portion of said resilient element within a said aperture, the greater transverse area extent of each said resilient element exceeding the smaller transverse extent of the aperture containing said resilient element,

c. a first insulative member (4),



d. means to attach (11) said first insulative member to said housing adjacent to the aperture portions of large transverse extent,

e. said first insulative member having electrically conducting areas (5) contacting at least some of said resilient elements,

f. a second insulative member (6) removably attachable to said housing, and

g. electrically conductive areas (7) upon said second insulative member contacting at least some of said resilient elements,

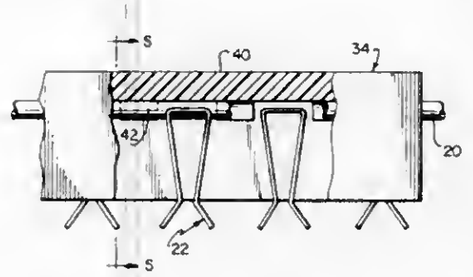
so that attachment of said second insulative member (6) causes each said resilient element to be axially constrained by said first and second insulative members.

4,029,376

BRIDGING CLIP ASSEMBLY AND COVER THEREFOR

Edward E. Headington, Port Monmouth; Albert J. Tutko, Belle Mead, both of N.J., and Robert H. Knickerbocker, Cheshire, Conn., assignors to The Siemon-Dynamic Manufacturing Co., Watertown, Conn.; Bell Telephone Laboratories, Incorporated, Berkeley Heights, N.J. and Western Electric Company, Inc., New York, N.Y.

Filed Oct. 10, 1975, Ser. No. 621,350
Int. Cl.² H01R 31/08
U.S. Cl. 339—19 2 Claims



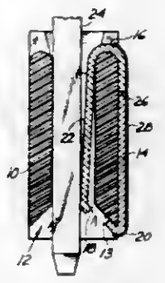
1. A cover for an electrical terminal bridging assembly comprising a base portion and two side portions, said side portions being perpendicular to said base portion thereby defining an elongated member closed on three sides and open on the fourth side opposite said base portion, said base portion containing a plurality of engaging means spaced along the length thereof, each of said engaging means being adapted to mate with and frictionally engage an electrical terminal bridging assembly, each of said engaging means being a triangularly shaped member, the base of the triangle being contiguous with the base of said cover and the apex of the triangle being in the space provided between the sides of the cover, the apex of the triangle having a recess therein which extends substantially to the base of the triangle, the sides of the recess being adapted to frictionally engage an electrical terminal bridging assembly and to provide a snap action which captivates the electrical terminal bridging assembly.

4,029,377

PUSH-ON BUS BAR

Anthony C. Guglielmi, Plainfield, Conn., assignor to Rogers Corporation, Rogers, Conn.

Filed Feb. 3, 1976, Ser. No. 654,846
Int. Cl.² H01R 31/08
U.S. Cl. 339—19 24 Claims



1. An electrical bus connector for interconnecting terminal pins of a linear array comprising:

an elongated housing, said housing being formed from a nonconductive material and being provided with a plurality of passages extending therethrough from oppositely disposed first and second sides thereof, said passages being arranged in a linear array for receiving terminal pins to be interconnected;

at least a first bus conductor, said first conductor having a first portion which is adjacent to a third side of said housing, said third housing side extending between said first and second sides, said first conductor being provided with a first plurality of fingers extending outwardly from a first edge thereof, said first conductor first edge facing the junction of said first and third housing sides and said fingers of said first plurality of fingers being spaced in a pattern defined by the terminal pins to be interconnected and having a width less than the width of said housing passages, said fingers of said first plurality of fingers passing about the junction of said housing first and third sides into preselected of said passages whereby said fingers define spring contacts for establishing electrical connections with the terminal pins extending through housing passages into which said fingers extend; and

mounting means mounting said first conductor on said housing.

4,029,378

ELECTRIFIED CHANNEL WITH CORRESPONDING SNAP ACTING CONNECTOR

Edoardo Bolis, Milan, Italy, assignor to ITT Industries, Inc., New York, N.Y.

Filed Mar. 11, 1976, Ser. No. 665,842
Int. Cl.² H01R 13/60
U.S. Cl. 339—22 B 2 Claims

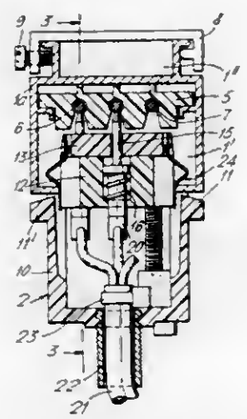
1. An electrified channel and snap acting connector therefor comprising:

a channel having a plurality of conductors mounted side by side in an insulating body within said channel;

said connector having mating contacts resiliently urged against said conductors when said connector is inserted into said channel;

said connector comprising a closing cap, a contact guiding

body having a cover, resilient means for urging said contacts in said guiding body outwardly, a ground screw,



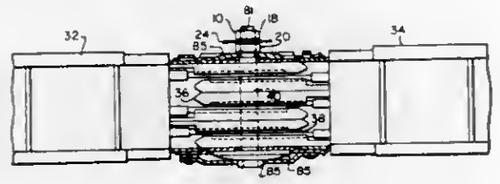
a ground contact spring connected to said ground screw, and a connector body supporting spring on the exterior of said connector body inside said closing cap.

4,029,379

ELECTRICAL BUS DUCT WITH TORQUE INDICATION NUT

James R. Kotala, Aliquippa, and William W. Hamilton, Beaver, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Sept. 14, 1973, Ser. No. 397,485
Int. Cl.² F16B *31/00*; **H01R** *13/60*
U.S. Cl. 339—22 B **2 Claims**



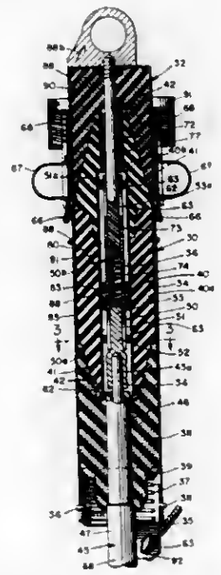
1. A torque indicating nut, comprising:
an engaging portion having an internally threaded opening therein, said engaging portion being engageable with a member having a complementary externally threaded portion thereon, said engaging portion being rotatably movable in threaded engagement with said member to cause force to be applied to an object by said engaging portion;
a driving portion, said drivin portion being rotatably movable, said driving portion having an opening through which said member may protrude, said opening having no internally threaded portion;
a bridging portion having an opening through which said member may protrude, said driving portion communicating with said engaging portion by way of said bridging portion to cause said engaging portion to move into contact with said object during rotation of said driving portion to apply said force to said object, the radial dimensions of said driving portion and said engaging portion being larger than the radial dimension of said bridging portion; and
a relatively flexible indicating member easily observable relative to said driving portion and having an opening therein which is sufficiently large to allow said indicating member to enclose said bridging portion but which is not sufficiently large to allow said indicating member to enclose said driving portion or said engaging portion, said indicating member being a separately manufactured article from said bridging portion, said engaging portion and said driving portion, said indicating member being initially flexed for disposal around said bridging portion and thereafter trapped between said driving portion and said engaging portion, said bridging portion maintaining a spaced relationship between said engaging portion and said driving portion until a predetermined value of said force is applied to said object, which force is related to a predetermined value of torque to which said driving portion is submitted during rotation, said driving portion being disengageable from said engaging portion at said bridging portion after said predetermined value of torque is attained, said indicating member then being freeable from said bridging portion to thereby indicate that said predetermined valve of said torque has been attained.

4,029,380

GROUNDED SURFACE DISTRIBUTION APPARATUS

Edward H. Yonkers, Wilmette, Ill., assignor to Joslyn Mfg. and Supply Co., Chicago, Ill.

Continuation of Ser. No. 660,748, Aug. 15, 1967, abandoned.
This application Jan. 20, 1970, Ser. No. 4,396
Int. Cl. H01r *13/52*
U.S. Cl. 339—60 R **7 Claims**



1. A cable terminal for a high potential grounded sheath cable for underground distribution systems comprising:
a cylindrical conductive grounding housing open at one end;
a hard dielectric filler secured in said housing and having a convex sealing surface projecting in the direction of said open end;
a readily removable conductive grounding cover for said open end conductively engaging said housing;
means for grounding said cover to the grounded sheath of a cable;
a soft dielectric filler in said cover having a concave sealing surface making void-free interfacial engagement with said convex surface; and
compression means positioned between said cover and said soft dielectric filler to maintain said soft dielectric filler under pressure.

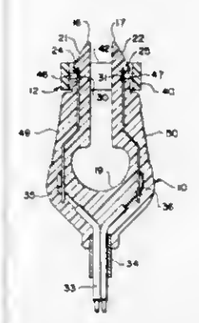
4,029,381

ELECTRICAL CONNECTOR

Mahone T. Tarrall, and Michael D. Patzer, both of Boulder, Colo., assignors to Valleylab, Inc., Boulder, Colo.

Filed Jan. 16, 1976, Ser. No. 649,623
Int. Cl.² H01R *13/62*
U.S. Cl. 339—61 R **5 Claims**

1. An electrical connector combination comprising: a male connector comprising a base portion, at least two substantially parallel resilient prongs extending from the base portion, a notch defined in the outer side portion of each prong, at least one electrical conductor positioned within each prong and exposed at the bottom portion of the notch defined in the prong, and outwardly facing inclined surfaces defined between the terminus of each prong and the notch defined therein, the inclined surfaces extending to the terminus of each prong and being in a diverging relationship from the termini of the prongs to the notches defined in the prongs; a female connector comprising a member having an opening with opposed sidewalls and of a depth greater than the width of the notches in the prongs defined therein and adapted to receive the prongs of the male connector, the width of the opening being greater than the greatest distance between the



termini of the prongs, and at least one protruding electrical contact narrower than the width of the notches positioned on each internal sidewall of the opening and adapted to bear upon the exposed conductor of the male connector and fit between the sidewalls of a notch when the male connector is situated in the female connector; whereby, the male connector may be inserted into the female connector by elastically deforming the prongs together as the inclined surfaces bear upon the opening in the female connector upon insertion of the prongs into the opening defined in the female connector, and permitting the prongs to expand thereby positioning the male connector by means of the side edges of the notches bearing upon the electrical contacts in the female connector with the exposed conductors in the bottom of the notches also bearing upon the contacts.

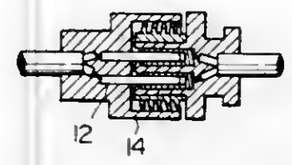
WATERTIGHT MEANS FOR ELECTRIC PLUG-RECEPTACLE COUPLING

Yosiharu Kōda, Tokyo, Japan, assignor to Denkosha Co., Ltd., Tokyo, Japan

Filed Nov. 28, 1975, Ser. No. 635,878
Claims priority, application Japan, Dec. 9, 1974, 49-140448
Int. Cl.² H01R *19/60*
U.S. Cl. 339—94 M **4 Claims**



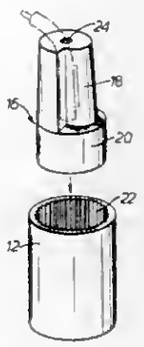
1. A watertight means for an electric plug-receptacle coupling, the electric plug and the receptacle having an axially extending support surface, and the support surfaces facing each other to define therebetween an annular space having a radius and each having an end, the support surface ends being axially spaced from each other, the watertight means consisting of a tubular packing between the support surface ends and secured to one of the support surfaces, the packing comprising a series of more than two flanges extending radially into contact with the other one of the support surfaces and having a radius larger than the radius of the annular space, and all the flanges in contact with the other support surface being arcuately flexed by the other support surface in a direction from the end of the one support surface towards the end of the other support surface.

4,029,383

ELECTRICAL CONNECTORS

John Patrick Harding, Bushey, and David Sydney Butler, Hassocks, both of England, assignors to The Post Office, London, England

Continuation of Ser. No. 524,985, Nov. 18, 1974, abandoned.
This application May 19, 1976, Ser. No. 687,759
Claims priority, application United Kingdom, Nov. 20, 1973, 53826/73; May 17, 1976, 22037/76
Int. Cl.² H01R *7/06*
U.S. Cl. 339—97 R **7 Claims**



1. An electrical connector comprising:
a body member having an inner wall defining an elongate cylindrical bore of circular cross-section, said bore extending into the body member from an outside surface thereof,
an elongate member located within said body member and surrounded by said inner wall,
a cylindrical boss of circular cross-section corresponding to the bore diameter at one end of said elongate member mating with the inner wall of said body member at a location remote said outside surface,
a tapered shank portion of snail cam cross-section on said elongate member extending from said boss to the other end of said elongate member adjacent said outside surface, the cross-sectional area of said snail cam decreasing progressively towards said other end of said elongate member, and
means to rotate the body member and elongate member relative to each other.

4,029,384

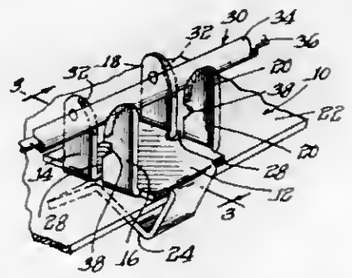
GROUNDING CLIP

Ernest William Reinwall, Jr., McHenry, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill.

Continuation of Ser. No. 542,740, Jan. 20, 1975, abandoned.
This application May 14, 1976, Ser. No. 686,345
Int. Cl.² H01R *9/08*
U.S. Cl. 339—98 **1 Claim**

1. An electrical connector for receiving an insulated electrical conductor having a central conductor and an insulating cover, comprising an electrically conductive plate-like base, two pairs of adjacently positioned blades extending substantially normal to and formed integral with said base, adjacently spaced edges of each pair of said blades defining parallel vertical passageways spaced for receipt of said insulated conductor therebetween and for cutting through said insulation, at least one of each pair of blades being shaped for insertion into a standard spade-type terminal member, the upper edges of each pair of blades converging inwardly toward a respective passageway, said edges being coined to a reduced width to facilitate penetration into said insulating cover of said electri-

cal conductor when said conductor is forced between said flared edges, each said blade being substantially planar and the planes of each pair of blades relatively diverging outwardly from said base resiliently to accommodate oversize electrical conductors and spacing the coined edges to cut through the conductor insulation into engagement with the conductor at axially spaced close-coupled areas predetermined by the divergence of the blades, and a single notch in the edge of one



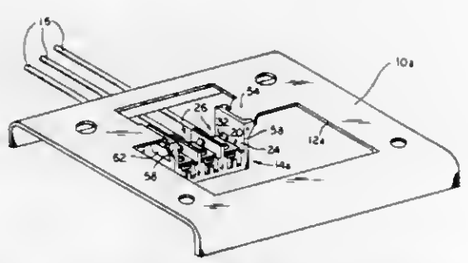
of said blades of each pair thereof, an outer margin of said notch extending inwardly from and perpendicular to the edge of said blade and an inner margin extending obliquely along a segment thereof and opening into said passageway opposite an unnotched central conductor contacting edge of the other blade, said unnotched blade edge and said notch margins providing a three-point wedging engagement for said central conductor.

4,029,385

ELECTRICAL CONNECTOR AND MEANS OF MOUNTING SAME

Eugene J. Mysiak, Cicero, and Allen J. Burry, Prospect Heights, both of Ill., assignors to Molex Incorporated, Lisle, Ill.

Division of Ser. No. 580,558, May 27, 1975, abandoned. This application Apr. 22, 1976, Ser. No. 679,472
Int. Cl.² H02B *1/04*
U.S. Cl. 339—128 **1 Claim**



1. In combination, a panel with an aperture formed therein, a connector housing adapted to be mounted on said panel, and mounting means cooperating between said panel and said housing to mount said housing on said panel, the improvement in said mounting means comprising:

a pair of mounting tabs formed on said panel extending into the aperature toward one another in a plane substantially parallel to the plane of said panel; and

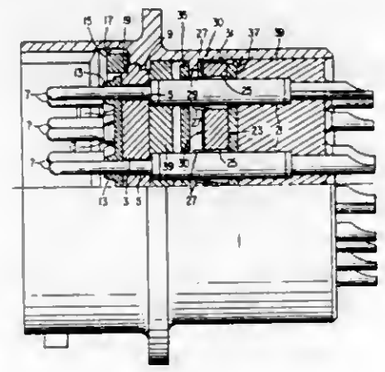
a pair of parallel, spaced apart tab receiving legs formed on said housing, each adapted to mount one of said tabs with said tabs extending perpendicular to said leg, each leg including slot means formed thereon to receive the respective tab, the outer portions of one of said slot means being spaced apart from the outer portions of the other slot means, a distance greater than the distance between the ends of said tabs each slot means having resilient locking means located therein for allowing insertion of the tabs in the respective slot means past said locking means and thereafter blocking withdrawal of said tabs.

4,029,386

CONNECTOR HAVING A PLATED PLASTIC GROUND FOR FILTER CONTACTS

Leonard Albert Krantz, Jr., and Jack Bernard Fort, both of Sidney, N.Y., assignors to The Bendix Corporation, Southfield, Mich.

Filed Feb. 23, 1976, Ser. No. 660,530
Int. Cl.² H01R *13/34*
U.S. Cl. 339—143 R **17 Claims**



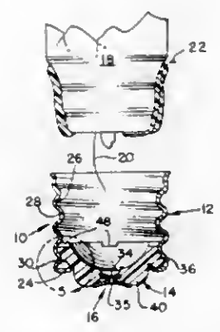
7. A ground element for grounding filters on contact terminals in a connector, comprising a member having apertures therein surrounded by integral spring tines for receiving and engaging the filters on the contact terminals, the member and tines being molded from plastic material and being plated with metal to make it electrically conducting.

4,029,387

ELECTRIC LAMP BASE AND METHOD OF ASSEMBLY

John W. Eager, 51 Dale Drive, Chatham, N.J. 07928

Filed Nov. 24, 1975, Ser. No. 634,354
Int. Cl.² H01J *5/60*
U.S. Cl. 339—146 **7 Claims**



1. A base assembly for electric lamp and the like comprising:

a thin-walled cylindrical shell having an inwardly directed flange at one end and screw threads extending from said one end toward the other end thereof, said flange having an inner edge portion inclined toward the other end of said shell, said threads being formed by inward deformation of the shell wall thereby to establish complementing inner and outer threads in said shell;

a preformed insulator having a threaded rim portion engagable with said inner shell thread, a protruding portion concentric with said rim portion, an annular abutment surface between said protruding and rim portions, the juncture of said protruding portion and said annular abutment surface being formed with an annular groove to receive said inner edge portion of said flange, thereby to capture said edge portion in a manner to bind said insulator against unthreading relative to said shell, and means

for transmitting driving torque to said rim portion on a face thereof opposite from said annular surface; and

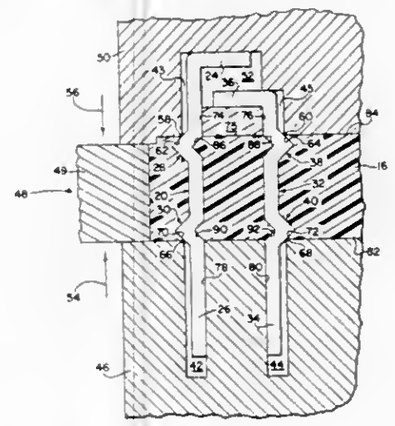
contact means secured to said protruding portion and spaced from shell.

4,029,388

ELECTRICAL TERMINAL CONSTRUCTED TO PREVENT INSERT MOLDING FLASH

Carl G. Knoll, Melrose Park, Ill., assignor to Illinois Tool Works Inc., Chicago, Ill.

Filed Apr. 2, 1976, Ser. No. 673,225
Int. Cl.² H01R *13/40;* **B29D** *3/00*
U.S. Cl. 339—218 R **3 Claims**



1. A base assembly for an electrical switch comprising a support member of molded plastic material and at least one elongated, substantially flat electrical contact terminal which has first and second substantially straight elongated segments which have first and second opposed sides, each of said elongated segments extending from one of a pair of substantially parallel surfaces of said support member in substantially a normal direction to its associated surface, and first and second substantially straight angled segments, each of which makes an angle with respect to one of said elongated segments and which emerges from said associated surface of said support member, wherein said contact terminals are molded into said support member with a reduced amount of flash by an insert-molding process which is achieved with a mold that is constructed to have a corner for each angled segment that is located on said first side of said elongated segment so as to be tightly wedged against said angled segment at the point where said angled segment emerges from its associated surface of said support member during said molding process and an associated elongated substantially flat area which is located on said second side of said elongated segment so as to be firmly forced against said second side of the associated contact terminal during said molding process.

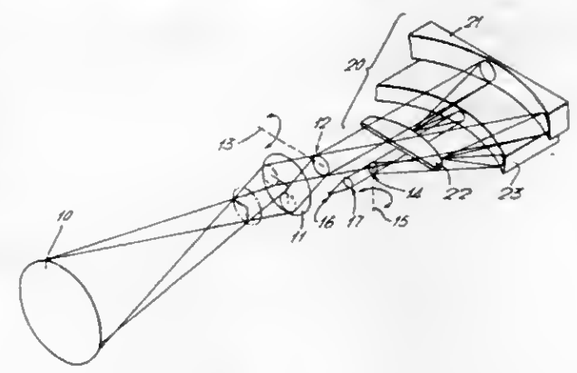
4,029,389

RADIATION SCANNING SYSTEM

Herbert Morrison Runciman, Glasgow, Scotland, assignor to Barr and Stroud Limited, Glasgow, Great Britain

Filed June 9, 1976, Ser. No. 694,484
Claims priority, application United Kingdom, July 26, 1975, 31392/75
Int. Cl.² G02B *27/17*
U.S. Cl. 350—7 **8 Claims**

1. A radiation scanning system comprising a radiation detector located at the focus of an objective lens element and a radiation scanning element arranged to scan radiation emanating from a field of view across said detector, wherein said radiation forms a primary pupil and one of said elements is located at a conjugate pupil formed by an optical assembly comprising first and second concave part-spherical reflectors respectively having their centres of curvature substantially optically co-incident with the locations of the primary pupil and the conjugate pupil, and a convex reflector substantially



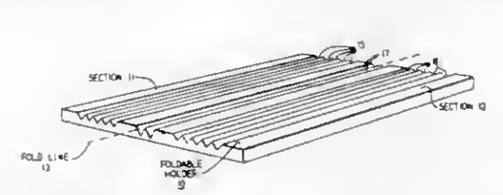
coincident with the locus of the focii formed by parallel beams of radiation emanating from said primary pupil and incident upon the first concave reflector.

4,029,390

OPTICAL FIBER GROUP SPLICING TECHNIQUE AND APPARATUS EMPLOYING UNIQUE FOLDABLE HOLDER

Edwin Leroy Chinnock, Rumson, and Detlef Christoph Gloge, Red Bank, both of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Dec. 23, 1974, Ser. No. 535,302
Int. Cl.² G02B *5/16*
U.S. Cl. 350—96 C **10 Claims**



1. A technique for splicing a first group of optical fiber waveguides to a second similar group of optical fiber waveguides, said technique comprising the steps of:

placing the fibers in said first and second groups in a foldable holder that comprises a relatively thin wafer of a bendable material having a major surface, said surface including first and second sections separated by a longitudinal line about which said wafer is foldable, each of said first and second sections including a plurality of longitudinal grooves laterally spaced in a parallel relation symmetrically about said fold line for receiving and aligning the fibers in said first and second groups, respectively, the fibers of said first group being disposed in the grooves of said first section oppositely to the fibers of said second group in the grooves of said second section;

fixing the fibers of said first and second groups to the grooves in said first and second sections of said holder, respectively;

dividing the fibers so fixed in said holder into two parts along the same line perpendicular to said fold line to expose perpendicular end faces of the fibers;

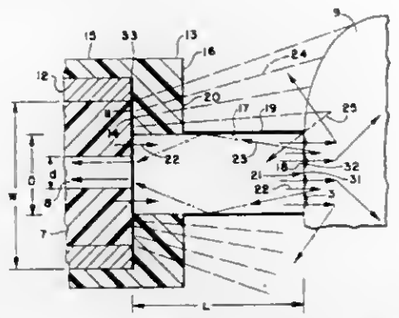
removing from said holder those parts of the fibers of said first group on one side of said dividing line and those parts of the fibers of said second group on the opposite side of said dividing line; and

folding said holder about said fold line to bring the fibers of said first group in alignment with the corresponding fibers of said second group.

4,029,391
LIGHT PROBE AND INTERFACE THEREFOR

Park French, Aurora, Ohio, assignor to Sterndent Corporation, Mount Vernon, N.Y.

Continuation-in-part of Ser. No. 499,491, Aug. 22, 1974, Pat. No. 3,947,088. This application Jan. 8, 1976, Ser. No. 647,365
Int. Cl.² G02B 5/14
U.S. Cl. 350—96 C 23 Claims



1. An end cap for a light probe for directly and indirectly optically coupling such light probe and a sample, comprising light conductive means having a first end positionable in substantial abutment with such light probe and a second end positionable in substantial abutment with such sample for conducting substantially all the light received at one end directly to the other end and thus substantially directly optically coupling such light probe and sample, and

support means generally annularly about said light conductive means for holding said first end aligned and in substantial abutment with such light probe, said support means including light transparent means positionable in alignment with such light probe for indirectly coupling light between such light probe and sample.

4,029,392
LIQUID CRYSTAL DISPLAY

Akio Moriyama, Katano; Masakazu Fukai, Nishinomiya, and Katsuji Hattori, Uji, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Japan

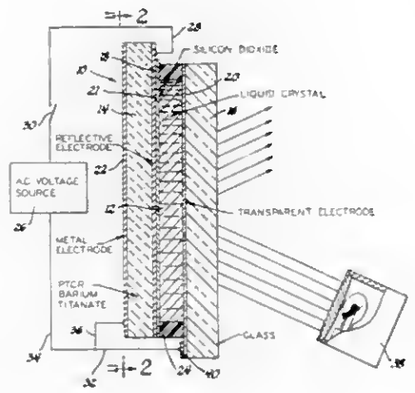
Filed July 11, 1974, Ser. No. 487,672
Claims priority, application Japan, July 20, 1973, 48-81723
Int. Cl.² G02F 1/13
U.S. Cl. 350—160 LC 5 Claims

1. A liquid crystal display device comprising two spaced plates one of which is a transparent front glass plate and the other of which is a white opaque ceramic rear plate, electrodes selectively disposed on the inner surfaces by said two plates, a nematic liquid crystal composition containing a pleochroic dye filled in the space between said two plates, and means for selectively applying an electric field across said nematic liquid crystal composition through said electrodes to thereby modulate light absorption in said liquid crystal composition when the electric field exceeds a threshold value.

4,029,393
INTEGRATED THERMALLY COMPENSATED LIQUID CRYSTAL DISPLAY DEVICE

Denois F. Dungan, and Adolph L. Micheli, both of Mount Clemens, Mich., assignors to General Motors Corporation, Detroit, Mich.

Filed Apr. 29, 1976, Ser. No. 681,472
Int. Cl.² G02F 1/13
U.S. Cl. 350—160 LC 3 Claims



1. A reflective mode liquid crystal cell having an integral heater that is self-actuating below a predetermined ambient temperature to permit liquid crystal displays at lower ambient temperatures without significantly increasing the complexity of the liquid crystal cell or a system including it, said reflective mode liquid crystal cell comprising:

a first member having a substantially flat surface portion thereon formed of barium titanate having a preselected positive temperature coefficient of electrical resistance;

a reflective electrically conductive coating on said barium titanate flat surface portion serving as one liquid crystal electrode;

a second member adjacent to said first member and having a transparent portion with a substantially flat surface facing said barium titanate surface portion, said transparent portion flat surface and said barium titanate flat surface portion being mutually spaced and substantially parallel;

a conductive transparent coating on said second member transparent portion flat surface serving as a complementary liquid crystal electrode;

a liquid crystal between said first and second members that exhibits an electro-optic effect in response to a voltage applied between said reflective and transparent coatings;

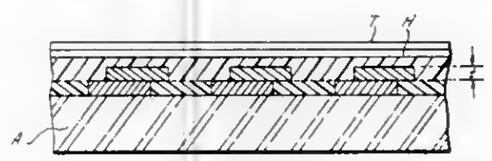
means retaining said liquid crystal between said members; and

at least one additional electrically conductive coating on said barium titanate spaced from said reflective electrode and serving as an additional electrode for maintaining a preselected electrical potential across said barium titanate plate that produces a significant electrical current flow therethrough and an attendant electrical heating therein only at ambient temperatures below a predetermined temperature, whereby said liquid crystal is maintained above said predetermined temperature without external control.

4,029,394
COLOR ENCODING FILTER AND METHOD FOR MAKING THE SAME

Yoshinobu Araki, Tondabayashi, Japan, assignor to Minolta Camera Kabushiki Kaisha, Osaka, Japan

Filed May 15, 1975, Ser. No. 577,862
Claims priority, application Japan, May 16, 1974, 49-53873
Int. Cl.² G02B 5/28; H01J 29/02
U.S. Cl. 350—166 8 Claims



1. A dichroic filter to provide color signals for video transmission comprising:

a substrate;

a first grid pattern, formed of both a high and low index of refraction material, having a substantially upper flat planar surface of a substance capable of transmitting a first predetermined bandwidth of energy, covering a portion of the substrate;

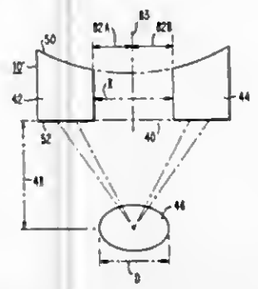
a second grid pattern, formed of both a high and low index refraction material, capable of transmitting a second predetermined bandwidth of energy superimposed directly on the upper planar surface of at least a portion of the first grid pattern, the second grid pattern having a constant thickness throughout the pattern and lying substantially in a single plane; and

a filler material having a medium index of refraction in the range of 1.59 to 1.95 and being substantially transparent to at least both the first and second predetermined bandwidths of energy and coacting with the first and second grid patterns to fill any spatial areas between both of the grid patterns and also the substrate whereby a flat surface is provided on the dichroic filter, the high index material having an index higher than the medium range and the low index material having an index lower than the medium range.

4,029,395
METHOD FOR ALTERING THE FOCAL ZONE OF A LENS SYSTEM

Michael J. Hurwitz, Wilkinsburg, and James W. Wonn, Hempfield Township, Westmoreland County, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Oct. 31, 1975, Ser. No. 627,734
Int. Cl.² G02B 3/06
U.S. Cl. 350—178 4 Claims



1. A method for altering the lateral dimension of a focal zone produced by an integral lens system having a first and a second lensing surface thereon, said method comprising the steps of:

removing a volume of lens material from said integral lens system so as to define first and second discrete remaining volumes, each of said remaining volumes having a point disposed therein, said points defining a straight line;

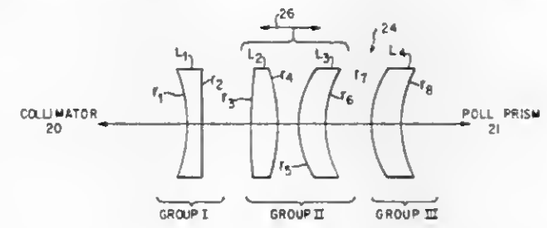
displacing one of said remaining volumes with respect to the other in such a manner that said points remain on said line, and that said remaining volumes are spaced apart; and

directing energy on one surface of each of said remaining volumes, whereby the energy is focused in a zone having an enlarged lateral dimension relative to the focal zone of the integral lens system.

4,029,396
LENS SYSTEM FOR MODIFYING SPHERICAL ABERRATION

Martin Shenker, Pomona, N.Y., assignor to Farrand Optical Co., Inc., Valhalla, N.Y.

Filed Aug. 6, 1976, Ser. No. 712,414
Int. Cl.² G02B 13/20, 9/34
U.S. Cl. 350—188 5 Claims



1. A lens system for modifying the spherical aberration of an optical apparatus, the lens system comprising first, second and third lens groups arrayed in order along the optical axis of said apparatus;

said first lens group having a negative optical power;

said second lens group having substantially zero optical power and having one or more lens elements bent to have a substantial amount of spherical aberration; and

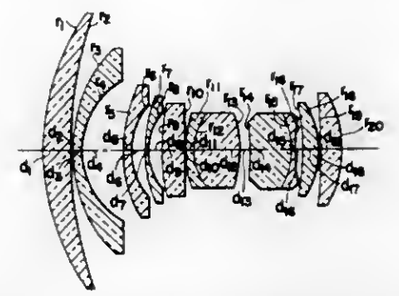
said third lens group having a positive optical power;

and wherein the relative spacing between said second lens group and said first and third lens groups is variable.

4,029,397
RETROFOCUS-TYPE WIDE-ANGLE PHOTOGRAPHIC LENS SYSTEM

Nobuo Yamashita, Tama, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Mar. 19, 1974, Ser. No. 452,670
Claims priority, application Japan, Mar. 20, 1973, 48-32213
Int. Cl.² G02B 13/04
U.S. Cl. 350—214 7 Claims



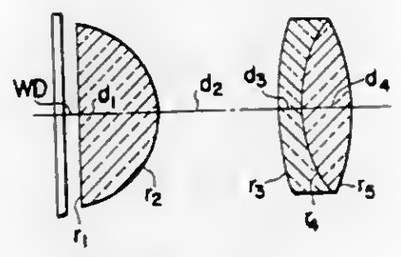
1. A retrofocus-type wide-angle photographic lens system comprising a front lens group and rear lens group arranged on both sides of an airspace, said front lens group being arranged on the object side of said airspace and said rear lens group being arranged on the image side of said airspace, said airspace being selected such that coefficients of correction for spherical aberration and sagittal astigmatism, when said rear lens group is moved toward said front lens group, are small and the coefficient of correction for meridional astigmatism at that time is large, said retrofocus-type wide-angle photo-

graphic lens system being arranged so that focusing in close-up photographing and correction of aberrations can be both attained by moving said rear lens group toward said front lens group.

4,029,398
OBJECTIVE FOR VIDEO DISKS

Toshimichi Kotzumi, Sagamihara, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed July 18, 1975, Ser. No. 597,224
Claims priority, application Japan, July 22, 1974, 49-83888
Int. Cl.² G02B 9/06
U.S. Cl. 350—231 **6 Claims**



1. An objective for video disks comprising a front lens component and a rear lens component, said front lens component being an approximately hemispherical lens with its plane surface positioned toward the object side, said rear lens component being a cemented doublet lens consisting of a concave lens and a convex lens, said objective for video disks satisfying the following conditions:

(1) $1.15 > f_1/f > 0.97$
(2) $1.5 > r_2/d_1 > 1.1$
(3) $n_2 - n_3 > 0.28$
(4) $1.01 > r_4/f > 0.85$
(5) $0.91 > d_2/f > 0.57$

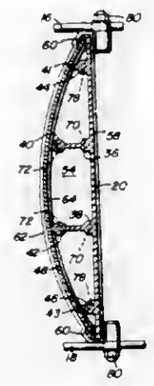
wherein reference symbol f represents the focal length of the lens system as a whole, reference symbol f_1 represents the focal length of the front lens component, reference symbol r_2 represents the radius of curvature of the surface on the image side of the front lens component, reference symbol r_4 represents the radius of curvature of the cemented surface of the rear lens component, reference symbol d_1 represents the thickness of the front lens component, reference symbol d_2 represents the airspace between the front lens component and rear lens component, and reference symbols n_2 and n_3 respectively represent refractive indices of respective lenses constituting the rear lens component.

4,029,399
FRAME FOR CONVEX MIRROR

Ernest Halle, 30 Cadwalader Terrace, Trenton, N.J. 08618

Filed Feb. 19, 1976, Ser. No. 659,549
The portion of the term of this patent subsequent to Mar. 22, 1994, has been disclaimed.
Int. Cl.² G02B 5/10
U.S. Cl. 350—293 **7 Claims**

1. A mirror construction comprising a mirror element including first and second opposite side edges, a mounting plate of a plan shape corresponding to the plan shape of said element over one side of which said element is placed in plan registry therewith, said plate including first and second opposite side edges corresponding with the first and second side edges, respectively, of said element, the first side edge of said plate being generally straight, the second side edge of said plate including opposite end portions which curve inwardly toward the remote ends of the first side edge of said plate, said second side edge end portions including retaining flange portions extending therealong, projecting outwardly of said one side of said plate and terminating outwardly in inwardly directed flange portions overlying said one side of said plate in spaced relation relative thereto, elongated reinforcing flanges supported from said one side of said mounting plate, projecting outwardly therefrom and extending between said first and second edges of said plate, said reinforcing flanges including arched outer longitudinal edges underlying, abutted by and closely conforming to the contours of the adjacent portions of the side of said mirror element opposing said one side of said

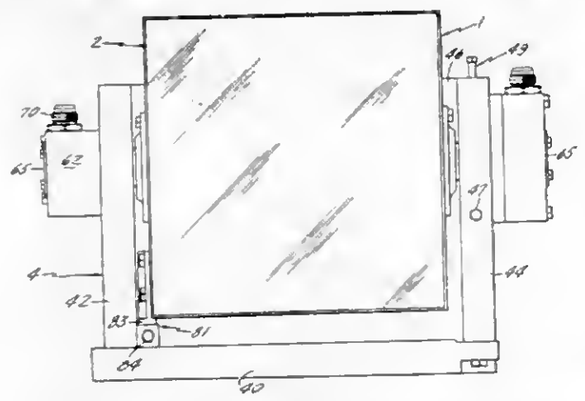


mounting plate with said second side edge of said element being held captive within said retaining flange portions and beneath said inwardly directed flange portions, and a cap panel removably secured over said first side edge of said plate and the corresponding edge of said element, said cap panel including a first inturned retaining flange overlying the outer side of the first side edge of said element and a second inturned flange overlying the first side edge marginal portion of said plate on the other side thereof.

4,029,400
PRESSURE BALANCED COOLED MIRROR WITH AXIALLY MOVABLE TRANSFER TUBE ASSEMBLIES

Fredrick G. Eltel, North Palm Beach, Fla., assignor to United Technologies Corporation, Hartford, Conn.

Filed Nov. 25, 1975, Ser. No. 635,182
Int. Cl.² G02B 5/08
U.S. Cl. 350—310 **8 Claims**

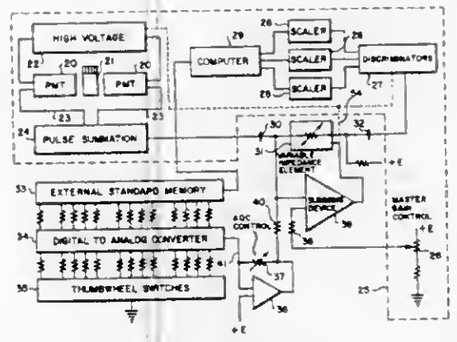


1. In combination, a laser mirror, means for mounting said laser mirror, said mirror containing coolant passages, first means for directing a coolant fluid from said mounting means to said coolant passages, second means for directing the coolant flow from said coolant passages to said mounting means, said mirror having a first opening therein and a second opening therein, said first opening being connected to one end of said coolant passages and said second opening being connected to the other end of said coolant passages, said first means for directing a coolant fluid from said mounting means to said coolant passages including a first axially movable transfer tube assembly, said second means for directing the coolant flow from said coolant passages to said mounting means including a second axially movable transfer tube assembly, said first transfer tube assembly having one end positioned in said first opening, said second transfer tube assembly having one end positioned in said second opening, said mounting means having a third opening therein and a fourth opening therein, said third opening facing said first opening on said mirror, said fourth opening facing said second opening on said mirror, said first transfer tube assembly having its other end positioned in said third opening, said second transfer tube assembly having its other end positioned in said fourth opening, means limiting the axial movement of each of said first and second transfer tube assemblies.

4,029,401
AUTOMATIC QUENCH COMPENSATION FOR LIQUID SCINTILLATION COUNTING SYSTEM

Roy E. Nather, Solana Beach, Calif., assignor to Beckman Instruments, Inc., Fullerton, Calif.

Continuation of Ser. No. 650,842, July 3, 1967, abandoned. This application May 3, 1972, Ser. No. 250,089
Int. Cl.² G01T 1/20
U.S. Cl. 250—328 **8 Claims**



1. A method of automatically compensating for spectral shift due to quench in a liquid scintillation nuclear counter having an adjustable and voltage-controllable parameter to which the alignment of the spectral energy end-point of an isotope with a selected discriminator level is responsive, wherein the counter has at least one energy level counting window, a computer, and a digital-to-analog converter for producing an output voltage proportional to the difference between a reference input and a sample input thereto, said method comprising the steps of:

establishing a first reference measure of quench as reference input of the digital-to-analog converter,

taking a count on a reference sample of the isotope with an external standard source,

calculating in the computer a measure of quench of the reference sample and applying said measure of quench as the sample input of the digital-to-analog converter,

adjusting the level of said parameter of the liquid scintillation counter so that the spectral energy end-point of the reference sample is substantially aligned with a selected counting window discriminator level,

taking a count on a test sample of the isotope with the external standard source,

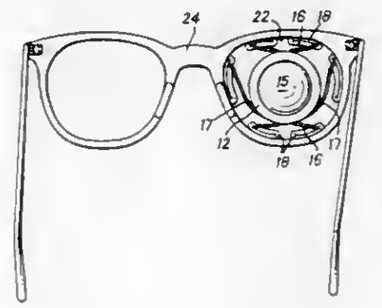
calculating in the computer a measure of quench of the test sample,

establishing the sample measure of quench as the sample input of the digital-to-analog converter thereby permitting automatic adjustment of the level of the voltage-controlled parameter in response to the output voltage of the digital-to-analog converter so that the spectral energy end point of the test sample is substantially restroed to the selected discriminator level, and thereafter noting the count on the sample while maintaining the voltage-controlled parameter at the adjusted level.

4,029,402
OPTICAL AID FOR USE IN THE SELECTION OF SPECTACLE FRAMES

Adrian Clive Noble, 16 Dovedale Avenue, Kenton, Harrow, Middlesex HA3 ODX, England

Filed Nov. 28, 1975, Ser. No. 636,050
Claims priority, application United Kingdom, Dec. 20, 1974, 55204/74
Int. Cl.² A61B 3/04
U.S. Cl. 351—22 **7 Claims**



1. An optical aid for use the selection of spectacle frames, comprising:

a holder for a lens;

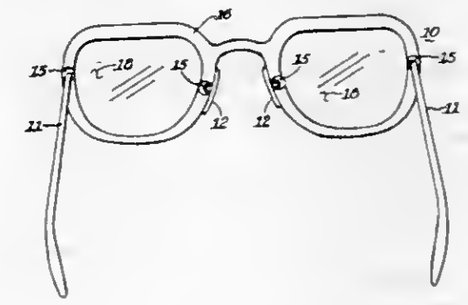
at least two pairs of resilient arms extending outwardly from said holder, the arms of each pair being opposed to each other, and the arms of at least one of the pairs being longer than the arms of at least one other pair; and

members at the extremities of the arms dimensioned and arranged to engage a lens-retaining groove of a spectacle frame, said members for at least each of the longer arms being arcuate in extent.

4,029,403
SELF-ADJUSTING EYEGLASSES

Gloria W. Harris, North Miami, Fla., assignor to The Raymond Lee Organization, Inc., New York, N.Y., a part interest

Filed Oct. 28, 1975, Ser. No. 626,175
Int. Cl.² G02C 5/14
U.S. Cl. 351—121 **2 Claims**



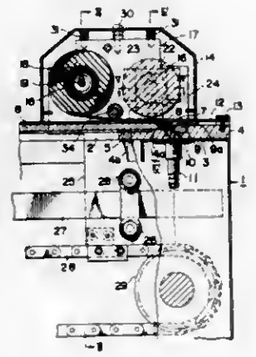
1. A pair of eyeglasses comprising a frame member enclosing a pair of eyeglass lenses, a pair of individual temple pieces and a pair of individual nose support pieces, with each temple piece and each nose support piece individually mounted by a ball and socket joint to the frame member, such that each of the two temple pieces and each of the two nose support pieces are pivotally mounted with respect to the frame and with respect to each of the other said pieces.

4,029,404

PLATEN COVER FOR A VACUUM CONTACT PRINTER

Hidekatsu Mizukami; Kosuke Fukui, and Tsutomu Kinoshita, all of Kyoto, Japan, assignors to Dainippon Screen Seizo Kabushiki-Kaisha, Kyoto, Japan

Filed Nov. 7, 1975, Ser. No. 629,841
Claims priority, application Japan, Sept. 2, 1975, 50-106400
Int. Cl.² G03B 27/62
U.S. Cl. 355—91 13 Claims



13. A vacuum contact printer comprising:
a body having upward light source therein,
a supporting frame mounted on the top surface of said body and provided with an air-tight resilient packing member at the periphery thereof,
a transparent hard plate supported on said supporting frame and surrounded by said resilient packing member,
a resilient vacuum sheet the rear end of which is secured to the rear portion of said supporting frame,
a pair of vertical bearing plates movable back and forth in a longitudinal direction along said supporting frame,
a winding roller both ends of which are journaled in said bearing plates and to which the fore end of said vacuum sheet is secured; said winding roller being biased in such a direction that the upper portion thereof is rotated toward the rear of said body,
a pressure roller rotatably supported on said bearing plates behind said winding roller so as to be vertically movable,
guiding means operatively connected to both ends of said pressure roller to cause said pressure roller to ascend so that said pressure roller is raised slightly above said vacuum sheet when said bearing plates are positioned at the rearmost of said supporting frame to reduce the pressure on said vacuum sheet,
a bottom-opened movable box covering said bearing plates, said winding roller and said pressure roller,
said movable box being supported by bolts embedded in the center of the top surface of said bearing plates so that said box can slightly swing back and forth in a longitudinal direction,
said swinging movements of said box being controlled by means of two pairs of compression springs disposed respectively between the ceiling panel of said box and the front and the rear surfaces of said bearing plates,
and a pair of electrically-controlled limit switches provided at the front and the rear portions of either of said bearing plates for stopping an operation of the apparatus or for giving a warning message whenever an inclination of said body exceeds a predetermined safety limit.

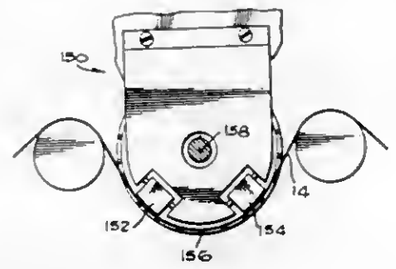
SPROCKETED FILM TRANSPORT

William H. Stutz, Los Angeles, Calif., assignor to Stutz-Bergman Design Group, Beverly Hills, Calif.

Division of Ser. No. 408,623, Oct. 23, 1973, Pat. No. 3,912,383. This application Oct. 14, 1975, Ser. No. 621,736
Int. Cl.² G03B 31/00
U.S. Cl. 352—6 13 Claims



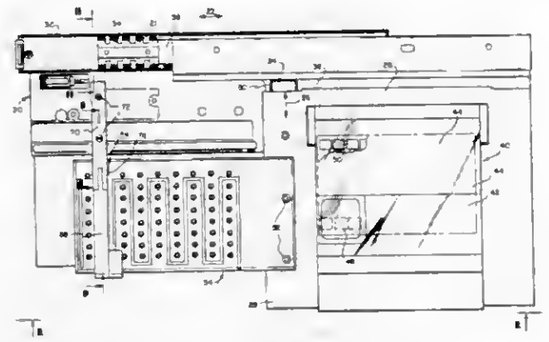
1. Apparatus for playing back sprocketed sound film comprising:
a machine frame;
a pair of hubs rotatably mounted on said frame;
a sprocket wheel rotatably mounted on said frame;
means for guiding film from around a first hub of said pair, partially about said sprocket wheel, and thence around the other hub of said pair;
a transducer head interiorly mounted with respect to said sprocket wheel and positioned to contact the film surface supported by said sprocket wheel;
said motor means including a stepping motor having a shaft directly connected to the sprocket wheel to rotate it at the same speed as the motor shaft, a flywheel, and a clutch frictionally coupling the flywheel to the motor shaft to permit slippage between them so that the stepping motor can suddenly start without suddenly rotating the flywheel while allowing the flywheel to minimize stepping motion of the shaft after the shaft is at full speed, said motor means being selectively operable to advance film incremently or advance film smoothly and continuously;
and means coupled to said transducer head for playing back the sound recorded on the film,
whereby the apparatus can be employed to transport sound film continuously or intermittently.

4,029,406

MICRO FICHE HANDLER

Ralph A. Sickles, 1418 Steamboat Bend, Tempe, Ariz. 85281

Filed July 6, 1976, Ser. No. 702,475
Int. Cl.² G03B 23/08; F16H 27/04
U.S. Cl. 353—27 R 15 Claims



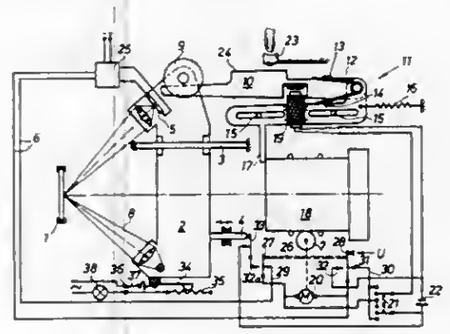
1. In a rectilinear micro fiche transport means; a frame; indexing means moveably mounted on said frame; a fiche carriage moveably mounted on said frame and connected to said indexing means; said indexing means and said carriage moveably in unison on said frame in two directions disposed at right angles to each other; said indexing means comprising a flat plate member; said plate member having opposite first and second sides; said first side having a plurality of equally spaced apart indexing portions arranged in intersecting rows; a first plurality of said rows being disposed in spaced apart parallel relation to each other and disposed in a first direction; a second plurality of said rows being disposed in spaced apart parallel relation to each other; said second plurality of said rows being disposed at substantially 90° with respect to and intersecting said first plurality of said rows; said indexing portions being common to both said first and second rows; said first side of said plate member also having a rectilinear track means comprising a series of adjacent opposed generally rectangular U-shaped portions disposed in continuity with each other; the U-shaped portion which are adjacent each other being opposed and in continuity with each other such that the continuity of U-shaped portions forms a unitary track which is alternately reversed in direction by means of each U-shaped portion; each U-shaped portion having an intermediate portion and a pair of spaced apart parallel portions disposed at substantially right angles to the respective intermediate portion; each one of said pair of spaced apart portions being in continuity with an opposed parallel portion of an adjacent U-shaped portion; said parallel portions of said U-shaped portions being disposed parallel to said rows of indexing portions; said second side of said plate member having rows of cam portions of generally herring bone shape; said rows of cam portions extending in zig-zag direction laterally with respect to said parallel portions of said U-shaped track portions; said rows of cam portions comprising first and second angularly disposed portions which are directed alternately at different angles to the direction of said parallel portions of said track portions; said first and second cam portions having adjacent ends disposed at transition proximities which substantially coincide with said indexing portions; an indexing detent means carried by said frame and disposed to be engaged by individual ones of said indexing portions; a guide member carried by said frame and engageable with said track means; a rotary cam means; means adapted for operating said rotary cam means and adapted to limit each rotary operation of said cam means; said cam means disposed to rotatably engage one of said herring bone cam portions during each operation of said rotary cam means; said rotary cam means having a rotary axis disposed at an angle to both said first and second cam portions.

4,029,407

FADING MECHANISM FOR SLIDE PROJECTORS WITH AUTOMATIC FOCUSING MEANS

Hermann Friedrich Albrecht, Hotzum, Germany, assignor to Rollei-Werke Franke & Heidecke, Braunschweig, Germany

Filed May 5, 1976, Ser. No. 683,514
Claims priority, application Germany, May 16, 1975, 2521760
Int. Cl.² G03B 3/10
U.S. Cl. 353—86 9 Claims



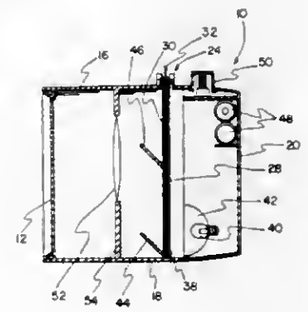
1. A slide projector comprising means for holding a picture slide in projection position, a projection lens member movable in the direction of its optical axis for projecting an image of said slide onto a viewing screen, a motor for moving said lens member axially, electro-optical scanning means for controlling said motor to move said projection lens member to a predetermined axial position of sharp focus with respect to a portion of said slide, a source of current for operating said motor, change-over switch means movable between a first position and a second position, circuit means effective when said switch means is in its first position for operatively disconnecting said motor from said scanning means and operatively connecting said motor to said source of current independently of said scanning means to drive said motor to move said projection lens member to an out-of-focus position substantially displaced axially from said predetermined sharp focus position, and circuit means effective when said switch means is in its second position for operatively connecting said motor to said scanning means to that said scanning means may control said motor to tend to move said projection lens member back from its substantially displaced out-of-focus position to its said predetermined axial position of sharp focus.

4,029,408

MAP READING APPARATUS

David R. Overby, 205 Brandon Court, Raleigh, N.C. 27606

Filed Sept. 29, 1975, Ser. No. 617,679
Int. Cl.² G03B 21/22, 23/10
U.S. Cl. 353—110 3 Claims



1. An apparatus for projecting map indicia on film onto a screen where the projected map image on said screen is substantially larger than the respective map indicia on said film, said map projecting apparatus comprising:
a. a housing structure;
b. film holding means disposed within said housing for receiving and holding film material, said film holding means including two spaced apart plates with aligned optical path opening means formed therein for allowing light to pass therethrough;
c. a screen formed within said housing generally forwardly of said film holding means;
d. circular disc film means normally held in said film holding means between said two plates and including a series of radially and circumferentially spaced different and distinct road or street map indicia thereon with each respective map indicia representing a certain geographical area, and wherein said optical path opening means formed within said film holding means is formed in an area radially spaced from a center point of said disposed disc when disposed between said plates such that in rotating said film disc between said plates the respective road or street map indicia radially formed thereon align with said optical opening means;
e. a light source disposed within said housing generally rearwardly of said film holding means relative to said screen and generally disposed behind said optical path opening means formed within said plates;
f. reflector means generally encompassing said light source within said housing structure for directing light from said

light source through said optical opening means within said plates; and

g. combination and cooperative mirror means and magnifying lens means disposed within said housing between said film holding means and said screen for receiving said road or street map image resulting from said light source projection through said optical opening means of said film means and for enlarging the received road or street map image and projecting the same onto said screen, whereby that particular road or street map image projected on said screen may be viewed even while operating a motor vehicle, said magnifying lens means being centrally disposed generally concentrically with said film means and disposed between said forwardmost plate and said screen; and wherein said mirror means is disposed between said magnifying lens means and the forwardmost plate of said film holding means for directing the map image projection passing through said optical path opening means towards the center of said film disc and through the adjacent magnifying lens where the map image is magnified and projected onto said screen, said mirror means comprising a pair of mirrors vertically spaced along the outer side of the forwardmost plate and including a first mirror disposed adjacent the optical opening means formed within said film holding means and disposed at approximately a 45° angle relative to the forwardmost plate of said film holding means, and a second mirror aligned with said first mirror and disposed about a portion of said forwardmost plate generally in the central area of the adjacent film disc and adapted to reflect the image received from said first mirror forwardly through said adjacent disposed magnifying lens where that particular map image is magnified and projected onto said screen.

4,029,409

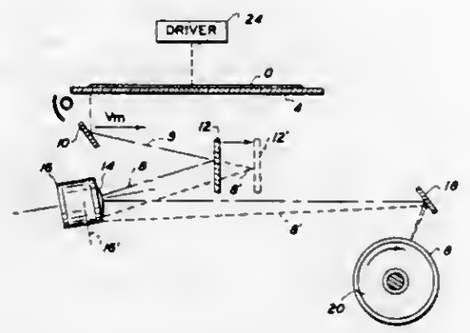
MULTI-MODE OPTICAL SCANNING SYSTEM

Richard A. Spinelli, and Robert F. Allis, both of Rochester, N.Y., assignors to Xerox Corporation, Stamford, Conn.

Filed June 20, 1975, Ser. No. 588,974

Int. Cl.² G03B *27/48, 27/50, 27/70*

U.S. Cl. 355—51 **5 Claims**



1. An optical system for projecting an image of an object from an object plane to an image plane, including the following disposed along an optical path:

support means to support an object at said object plane,

a projection lens,

photosensitive means disposed at said image plane to receive an image of an object,

first and second reflectors between said object plane and said projection lens to fold said optical path, said first and second reflectors being disposed for movement in synchronism relative to said object plane for scanning of a stationary object and to maintain a constant object conjugate distance during said scanning, said first and second reflectors being further movable one relative to the other to change said object conjugate distance,

said support means being movable in said object plane so as to move an object for scanning of said object relative to stationary optics,

an add reflector selectively positionable into and out of said optical path to form with one of said reflectors a reflection cavity to change said object conjugate distance,

said lens being disposed for movement relative to said optical path to change conjugate distances, and laterally of said optical path to remain centered therein.

4,029,410

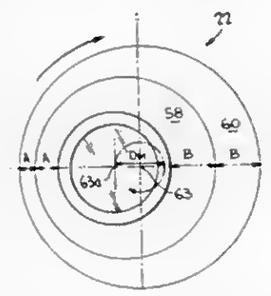
METHOD AND APPARATUS FOR MANIPULATING LINE WEIGHT IN AN IMAGE

Charles W. Richter, Herndon, Va., assignor to The United States of America as represented by the Secretary of the Interior, Washington, D.C.

Filed Sept. 5, 1975, Ser. No. 610,810

Int. Cl.² G03B *1/00, 27/52, 27/68*

U.S. Cl. 355—52 **26 Claims**



12. A lens holding attachment for a camera for manipulating line weight associated with an image representation comprising a mount for supporting said lens to said camera; means for moving said lens in a circular orbit about an optical axis of said camera and in a plane parallel to said image representation; and means for controlling the diameter of said orbit, said controlling means including means for varying the diameter of said orbit between zero and a preselected maximum diameter, where said maximum diameter is determined by amount of line weight manipulation.

4,029,411

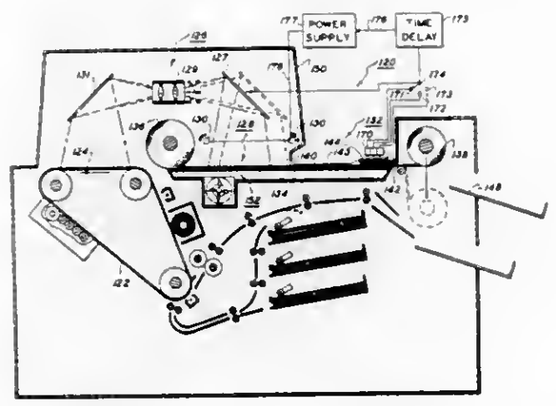
VARIABLE MAGNIFICATION COPIER

Denis J. Stemmle, Williamson, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Oct. 30, 1975, Ser. No. 627,434

Int. Cl.² G03B *27/48, 27/62*

U.S. Cl. 355—51 **4 Claims**



1. In a copier wherein documents are copied by optical imaging means providing selectively variable magnification copying of the documents onto a position on an imaging surface while said documents are moving along a path through a document imaging station transported by document transport means, where the documents have leading and trailing edges relative to said document transport means, and wherein said documents are illuminated for said optical imaging means by illumination means comprising a substantially instantaneous flash illumination system, and wherein the entire area of a document to be copied by said optical imaging means is simultaneously illuminated by said flash illumination system while the document is moving through said document imaging station, the improvement comprising:

document registration means outside of said document imaging station for registering one said edge of a document on said document transport means as a registration edge,

imaging position shifting means for automatically shifting the copying position within said document exposure station at which the moving registered document is copied in proportion to the selected magnification of said optical imaging means, including shifting the copying positions of both said leading and trailing edges of the document,

wherein said image position shifting means includes time delay means connecting between said document registration means and said flash illumination system and controlled by the selected magnification of said optical imaging means for varying the time of initiation of said flash illumination system relative to said moving registered document position in said document imaging station in response to the selected magnification of said optical imaging means and to said document registration means, and

wherein said image position shifting means includes means for maintaining stationary the position of the imaging surface onto which the document is copied when said copying position within said document exposure station is shifted.

4,029,412

MULTI-STANDARD REPROGRAPHIC CAMERA

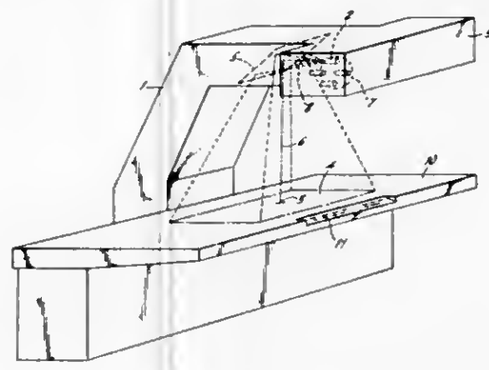
Harry Arthur Hele Spence-Bate, 115 Cheam Place, Morley, Australia (6062)

Filed Oct. 7, 1975, Ser. No. 620,279

Claims priority, application Australia, Oct. 8, 1974, 9175/74; Dec. 9, 1974, 9946/74; Apr. 14, 1975, 0918/75

Int. Cl.² G03B *27/32*

U.S. Cl. 355—64 **16 Claims**



1. A microcopying camera for recording records on microfiche or microfilm comprising a copying table and photographing lens mounted in a camera head with means for adjusting the front focal length of said lens relative to said copying table and the back focal length of said lens relative to said lens and a film transport device mounted in the camera head, the film transport device carrying when in use a microfiche or microfilm film, said means for adjusting the front focal length including means for increasing or decreasing the optical distance along an optical path between said table and said lens, a photographic shutter associated with said lens, and a mask assembly comprising a first and a second pair of masking blade side members, the edges of the members defining a masking frame, each of said pairs consisting of two parallel blades adapted for simultaneous movement towards or away from each other and linked by parallel linking members, each pair connected to a drive means providing said simultaneous movement, said drive means comprising a cam driven by a motor, said cam engaging with a cam surface associated with one of the side members of each pair, whereby adjustment of the front and back focal lengths associated with adjustment of the masking frame enables a plurality of different sized records to be recorded on one film.

4,029,413

COPIER WITH MEANS FOR HANDLING COMPONENTS OF FORM LETTERS, AND THE LIKE

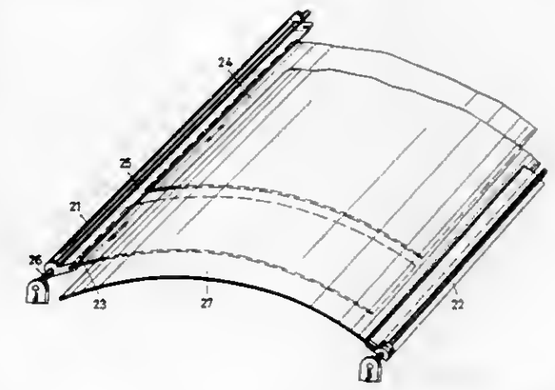
Gerhard Ritzerfeld, Schorlemer Allee 14, 1000 Berlin 33, Germany

Filed Oct. 23, 1975, Ser. No. 625,164

Claims priority, application Germany, Nov. 1, 1974, 2452430

Int. Cl.² G03B *27/62*

U.S. Cl. 355—75 **19 Claims**



5. In combination with a copier of the type comprised of a transparent support upon which originals to be copied are laid with their image-bearing sides face down, illuminating means for illuminating the image-bearing sides of such originals and means for forming reproductions of the illuminated images, an arrangement for use in the reproduction of printed forms, form letters, and the like, comprising first holding means adjacent the transparent support and operative for holding at least one lower original serving as a mask; second holding means adjacent the transparent support and operative for holding at least one upper original located above the original held by the first holding means so that a portion of the upper original is unblocked by the mask and accordingly exposed for illumination; mounting means mounting at least one holding means for movement relative to the other holding means; and means for moving the at least one holding means relative to the other holding means in the direction of the length of the transparent support, whereby different lines of an image on the upper original can be unblocked by the mask by effecting such relative lengthwise movement between the two holding means.

4,029,414

METHOD AND DEVICE FOR RECORDING COPIER USAGE DATA

Robert Aron Rubenstein, Mayfield Heights, Ohio, assignor to Addressograph Multigraph Corporation, Cleveland, Ohio

Filed June 30, 1975, Ser. No. 591,338

Int. Cl.² G03B *27/14*

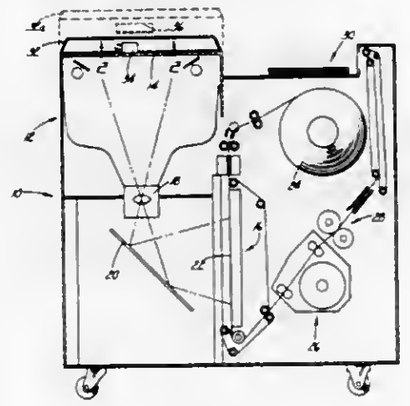
U.S. Cl. 355—112 **7 Claims**

1. In an apparatus for producing copies of documents or the like and including illumination station means for irradiating

documents to be copied, a device for recording data relating to the usage of the apparatus, said device comprising:

means operatively connected to said apparatus for producing visual data representative of the usage of the apparatus, and

means for presenting an image of said visual data to said apparatus whereby said apparatus may produce a copy of said image, said image presenting means presenting said image to said illumination station means whereby a copy thereof may be produced,



said illumination station means includes means for receiving a document for irradiation, said image presenting means being mounted in association with said receiving means, said receiving means including means for supporting a document in an object plane during irradiation and shielding means adjacent said support means for generally confining the radiation to the document, said image presenting means being carried by said shielding means for presenting said image to said object plane.

4,029,415

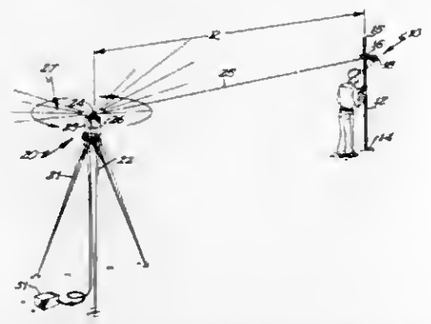
LASER LAND-SURVEYING APPARATUS WITH DIGITAL DISPLAY

Phillip R. Johnsoo, Mandan, N. Dak., assignor to Dakota Electron, Inc., Mandan, N. Dak.

Filed Feb. 3, 1975, Ser. No. 546,543

Int. Cl.² G01C *3/08, 3/00*

U.S. Cl. 356—4 **20 Claims**



1. A laser land-surveying apparatus operable from an electrical power source and usable with the beam from a laser beam source for measuring linear displcement comprising:

a rigid grade pole having a base and an apex;

a laser beam detection unit mounted to said grade pole between base and apex for relative motion between said pole and said detection unit, including a laser beam detector operatively electrically connectable to the power source and generating an electrical detection signal in response to detection of the laser beam;

indicating means electrically connected to said detector and producing an indication perceptible to an operator in response to any detection of the beam by said detector;

measuring means electrically connectable to the power source and mechanically coupled between said laser beam detection unit and said grade pole to permit relative motion between said detection unit and said pole, said measuring means determining the distance between said laser beam detector and said base of said pole and generating an electrical grade signal containing information representative of the distance between said base and said laser beam detector; and

a digital display unit electrically connectable to the power source and electrically connected to said measuring means to receive said electrical grade signal from said measuring means and in response thereto to digitally, visibly display to the operator the numerical grade distance between said laser beam detector and said base of said grade pole.

4,029,416

SAMPLE-BACKGROUND-SIGNAL AUTOCANCELLATION IN FLUID-SAMPLE ANALYZERS

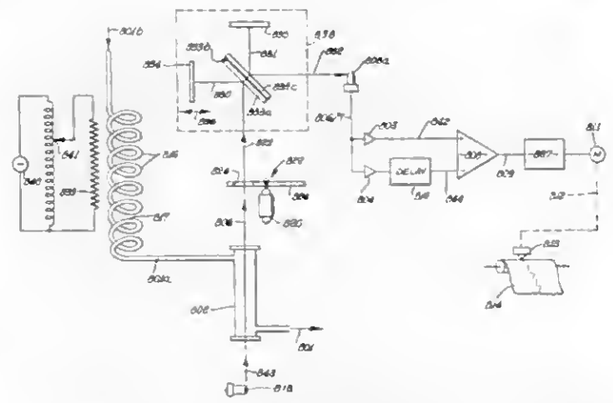
Roland C. Hawes, 771 Oakglade Drive, Monrovia, Calif. 91016

Continuation-in-part of Ser. No. 416,233, Nov. 15, 1973, Pat. No. 3,897,154. This application May 5, 1975, Ser. No. 574,618

The portion of the term of this patent subsequent to July 29, 1992, has been disclaimed.

Int. Cl.² G01N *21/34;* **G01J** *3/42*

U.S. Cl. 356—51 **15 Claims**



1. A system for monitoring a first constituent in a fluid stream, which stream may also include a second constituent whose concentration in the stream changes slowly relative to the changes in concentration of the first constituent, comprising:

a monitoring station, having sensing means for deriving a first component of a first measurement signal in quantitative response to presence of such first constituent in the station;

said sensing means also deriving an additional component of such first measurement signal in quantitative response to presence of such second constituent in the station, such additional signal component constituting a spurious signal component;

flow means, connected to the fluid stream and the monitoring station, for directing fluid from the fluid stream through the station;

primary signal-processing means, connected to receive the first measurement signal from the sensing means, for deriving in response to the first measurement signal a second measurement signal which is a time-distorted version of the first measurement signal and which has a first component and an additional component corresponding respectively to the first and additional components of the first measurement signal; and

secondary signal-processing means, connected to receive the first measurement signal along a signal path from the sensing means and the second measurement signal from the primary processing means, for deriving in response thereto a third signal which is a substantially continuous mathematical function of the first and second measurement signals, the function being such as to effect substantially complete mutual cancellation of the said additional measurement signal components, whereby the third signal comprises substantially only components corresponding to presence of the first constituent in the stream; and

utilization means responding to the third signal;

the said time-distorted version being related to the said first measurement signal by a substantially consistently applied function of time which is not directly controlled by any of the signals.

4,029,417

READING DEVICE FOR A MONOCHROMATOR

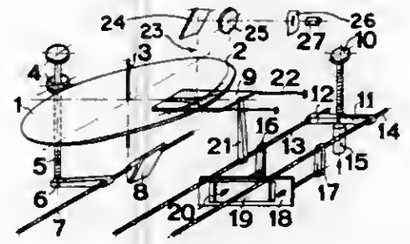
Jan Jasny, Warsaw, Poland, assignor to Polska Akademia Nauk, Instytut Chemii Fizycznej, Warsaw, Poland

Filed Oct. 7, 1975, Ser. No. 620,497

Claims priority, application Poland, Oct. 8, 1974, 174673

Int. Cl.² G01J *3/02*

U.S. Cl. 356—100 **4 Claims**



1. A reading device for a monochromator having an outlet slit of adjustable width and a light dispersing element adjustable with respect to the outlet slit to shift the spectrum in relation to the outlet slit, said reading device comprising a scale, means for displacing said scale in relation to adjustment of the light dispersing element with respect to the outlet slit, a transparent plate slidably mounted above the scale for movement in a direction perpendicular to said scale, a sliding mechanism for adjusting the width of the outlet slit, means connecting said plate to said sliding mechanism for corresponding movement therewith, a system of pairs of curved lines on said plate having curvatures such that the lines, at a determined position of the light dispersion element and a determined width of said slit intersect the scale at points characterizing a monochromator spectrum transmittance curve, a light-dividing element disposed above said plate to receive an image thereof, a lens adjacent the light-dividing plate to transmit said image, a mask with an aperture adjacent said lens and a photodetector adjacent said mask for receiving the image transmitted therethrough.

4,029,418

PLANT COMPARATOR

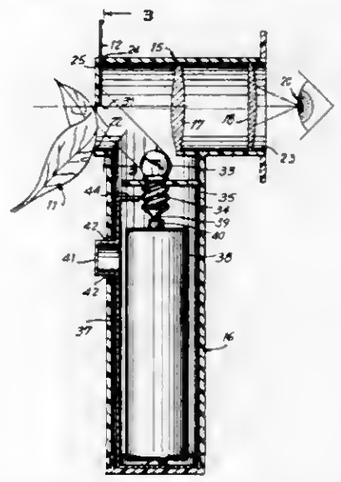
Hugh V. Cottingham, Upper Montclair, and Joseph Scrocco, West Orange, both of N.J., assignors to Black Hole Nebula Incorporated, Upper Montclair, N.J.

Filed Dec. 31, 1975, Ser. No. 645,757

Int. Cl.³ G01N *21/04*

U.S. Cl. 356—168 **6 Claims**

1. A hand held comparator for comparing a plant specimen to a color photographic reference of a plant specimen afflicted by a predetermined parasite, comprising in combination, lens means defining at least one object plane and a viewing region, said lens means producing a magnified image at the viewing region of a plant specimen disposed at the object plane, a support member defining an enclosure for supporting the lens means, said enclosure being cross-sectioned along a lengthwise extent to define a first opening of said enclosure, said first opening forming a viewing opening proximate to said viewing region defined by said lens means, the other end of said enclosure forming a second opening in substantial optical alignment with said first opening, the second opening in said support member defining an opening for positioning a plant specimen at the object plane, a light source for directing light on the object plane, said support member including positioning



means constructed and arranged to position a color photographic reference of a plant specimen afflicted by a predetermined parasite at said object plane to thereby provide a juxtaposed magnified image of said plant specimen and photographic reference at the viewing region.

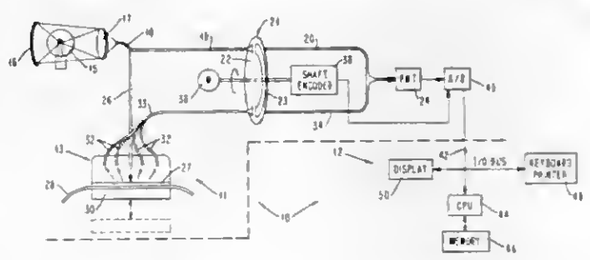
TEXTILE COLOR ANALYZER CALIBRATION

Paul A. Schumann, Jr., Wappingers Falls, and Alvin H. Tong, Poughkeepsie, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Oct. 10, 1975, Ser. No. 621,334

Int. Cl.² G01J *3/50;* **G01N** *21/48*

U.S. Cl. 356—173 **7 Claims**



1. The method of calibrating a spectrophotometer for measuring the reflectance of a test sample, said spectrophotometer comprising an instrument section including a light source, a detector, an opaque head having blackened inner walls defining a chamber and an opening adapted to be positioned next to a test object, first fiber optic means terminating in said chamber for directing light from said light source outwardly through said opening to illuminate a test object thereat, second fiber optic means terminating in said chamber for collecting light reflected from a test object through said opening and conducting such reflected light to said detector whereby said detector provides an output signal proportional to the intensity of light reflected from said test object, the steps comprising:

a. placing a mirror next to said opening as a test object and measuring the amount of light reflected from said inner wall;

b. placing a white standard next to said opening as a test object and measuring the amount of light reflected therefrom;

c. calculating the reflectance of said inner wall using the amounts of light measured in steps (a) and (b);

d. placing a test sample next to said opening as a test object and measuring the amount of light reflected therefrom;
e. and calculating the true reflectance of said test sample using the amounts of light measured in steps (b) and (d) and said reflectance of said inner wall.

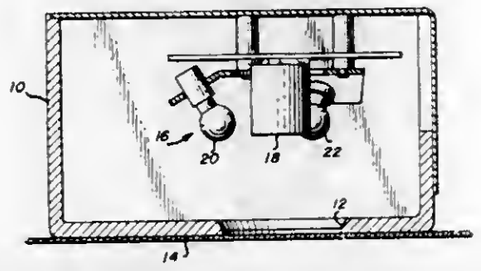
LIGHT REFLECTANCE INSTRUMENT
Romilly John Simms, 2192 Clayton Drive, Menlo Park, Calif. 94025
Filed Dec. 27, 1974, Ser. No. 536,715
Int. Cl.² G01N *21/48, 21/16, 21/32*
U.S. Cl. 356—209 **7 Claims**



1. An instrument for measuring the light reflectance from fabric and the like materials which have a heterogeneous surface configuration, comprising:
a housing having a nonreflective interior surface, said housing including a plate having an aperture defining a sensing area, said plate being disposed for engaging the surface of such a material and framing a portion of the material in the aperture, the aperture being sufficient to frame a relatively large number of all of the different types of individual components of the heterogeneous surface in the sensing area;
a light sensor mounted within said housing coaxially with respect to said aperture and a predetermined distance therefrom; and
only an odd number of light sources mounted within said housing at equidistant points around an outer periphery of said sensor and providing light beams along respective lines which pass through the center of said aperture, said lines being disposed at an angle with respect to said aperture axis which lies outside the range of from 35° to 55°.

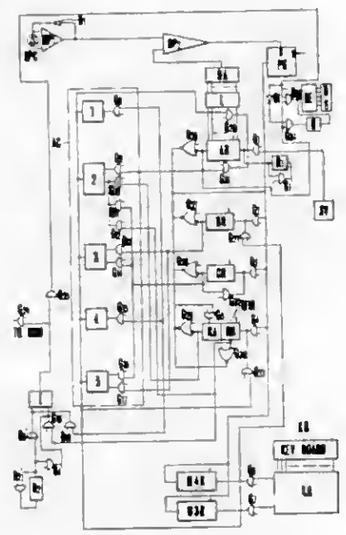
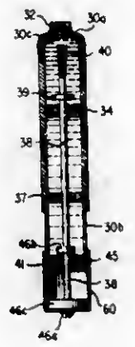
DIGITAL EXPOSURE METER
Nobuaki Sakurada, Yokohama; Nobuhiko Shinoda; Yukio Mashimo, both of Tokyo; Tadashi Ito, and Fumio Ito, both of Yokohama, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan
Filed Oct. 16, 1975, Ser. No. 622,834
Claims priority, application Japan, Oct. 17, 1974, 49-119802
Int. Cl.² G01J *1/42;* **G03B** *7/08*
U.S. Cl. 356—223 **9 Claims**

1. A digital exposure meter comprising:
a. a first conversion means for converting the value of the intensity of light into a first digital signal;
b. a second conversion means for converting the value of an exposure factor into a second digital signal;
c. a plurality of register means, at least two of said register means being connected with each other and each having a first transfer gate through which the content of each said register means is transferred from one to another;
d. applying means for applying said first and said second digital signals from said first and second conversion means to said register means;
e. a computing circuit, said computing circuit including at least addition-computing means having addition function and division-computing means having division function, and each of said computing means being connected to at least two of said plurality of register means through input gates and having a second transfer gate through which the output of said computing means is transferred to said register means;
f. sequence control means connected to said first transfer and said second transfer gates and input gates for generating control signals in sequence which are selectively applied to said gates to control the gating operation of each of said gates;



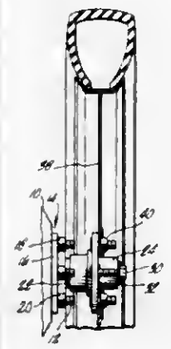
g. regulating means for regulating transmission of said control signals to said gates in predetermined sequential relation; and
h. display means connected to at least one of said register means for displaying the content of said register means.

4,029,422
DISPENSER FOR AIR DRYING LIQUID COATING
Edward J. Pillsbury, 377 S. Harrison St., East Orange, N.J. 07018
Continuation-in-part of Ser. No. 605,077, Aug. 15, 1975, abandoned. This application June 1, 1976, Ser. No. 691,528
Int. Cl.² A46B *17/08*
U.S. Cl. 401—117 **22 Claims**



1. A dispenser for air drying liquid coating material comprising in combination:
a tubular liquid container substantially closed at one end and terminating at the other end in a nozzle having an inner bore,
a longitudinal valve stem mounted for to-and-fro movement along the axis of said tubular liquid container,
said stem terminating at one end in a valve head disposed adjacent the inner bore of said nozzle and including an applicator brush protruding in axial relation from said valve head, the combination including said valve head and stem constructed to move between:
a first storage position in which the assembly including said valve stem, said valve head and said applicator brush is in retracted position with respect to said nozzle bore; and
a second operating position wherein the assembly including said valve stem and said valve head is extended to engage and close the inner bore of said nozzle forcing said applicator brush to protrude through said nozzle, and
guide means substantially spaced apart from the inner bore of said nozzle and disposed in fixed relation to the inner walls of said liquid container, said guide means including a disk-like member having a plurality of peripheral slots for the free flow of liquid therethrough and comprising an axially disposed opening large enough to accommodate said valve stem in freely movable relation, whereby said guide means functions to maintain said valve head and applicator brush centered with relation to the inner bore of said nozzle.

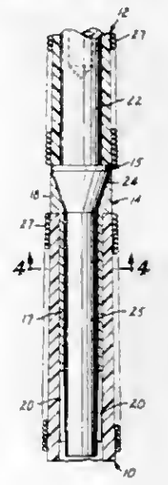
4,029,423
FREE-WHEELING SPINDLE ADAPTOR
Fred A. Sager, 42 Blackburn P., Ventura, Calif. 93003
Filed Nov. 24, 1975, Ser. No. 634,494
Int. Cl.² B60B *27/02, 27/06*
U.S. Cl. 403—3 **7 Claims**



1. A free-wheeling adaptor fitting to a drive hub, comprising an adaptor spindle including a spindle shaft and an adaptor plate, said adaptor plate having the capacity for being attached directly to the drive hub such that said spindle shaft is aligned with the drive hub;
a free-wheeling hub rotatably mounted on said adaptor spindle for free-wheeling motion, said free-wheeling hub having a wheel attachment pattern substantially the same as on the drive hub.

4,029,424
INTERNAL FISHING ROD FERRULE
William A. Dille, Maplewood, and Wayne E. Erickson, St. Paul, both of Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.
Filed Nov. 1, 1976, Ser. No. 737,331
Int. Cl.² F16B *7/00*
U.S. Cl. 403—292 **1 Claim**

1. An internal fishing rod ferrule comprising:
a female element formed of a metal having a tensile strength of at least seven thousand kilograms per square centimeter at two percent yield, said female element having a hollow generally cylindrical body with an external diameter to fit within a rod blank and having a larger diameter cylindrical end to abut the free end of the rod blank, said larger diameter end being internally tapered from the internal diameter of said body outward to one free end, the other free end of said body being slit longitudinally to define a plurality of spring fingers, said spring fingers having their free ends offset radially inward,
a male element formed of a metal having a tensile strength of at least seven thousand kilograms per square centimeter at two percent yield, said male element having a cylindrical body to fit within a rod blank, a larger diameter central portion to abut the free end of the rod blank and a cylindrical engaging end having a diameter slightly less than the internal diameter of said female element body



for engagement only by said spring fingers of said female element body, said male central portion being externally tapered from said male body to the diameter of said engaging end at a taper complementary to said internal taper of said larger diameter end of said female element.

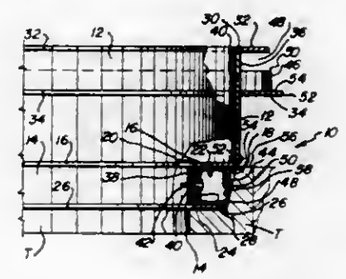
MANHOLE EXTENSION
Thurman A. Pelsue, 3706 S. Hibiscus Way, Denver, Colo. 80237
Filed July 10, 1975, Ser. No. 594,662
Int. Cl.² E02D *29/14*
U.S. Cl. 404—25 **4 Claims**



1. In a manhole extension for use in manhole casings of the type having an upwardly-facing annular seat recessed beneath a rim bordering the upper marginal edge of an upstanding wall therebetween wherein said extension includes a lower annular flange adopted to rest atop the casing seat, an upper annular flange spaced above the lower one, a ring connecting the inner edges of the upper and lower flanges cooperating therewith to define an outwardly-facing channel, and an inflatable gasket positioned within said channel for the purpose of sealing the joint between said extension and casing, the improvement which comprises a circular fence depending from the upper annular flange defining a gasket receiving seat which extends from the upper flange to a location spaced apart from the lower flange to span a gap between the top of the casing and the upper flange, said inflatable gasket being positioned outside of said gasket receiving seat to expand into said gasket receiving area and against the inside of said fence, said fence being positioned and adapted to cooperate with the channel and with the upstanding casing wall when the upper flange is placed thereagainst to define an enclosure substantially completely enveloping the gasket upon inflation thereof while leaving a portion of the inflated gasket exposed to engage said

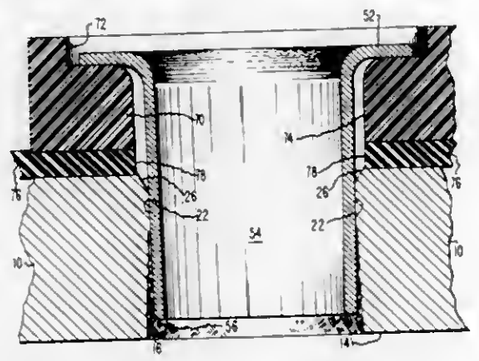
casing wall as well as the inside of said fence to form a continuous annular fluid-tight seal therewith while preventing extrusion of the inflated gasket out of the gap.

4,029,426

TUBULAR FASTENING SYSTEM

Dewey M. Sims, Jr., Westland, Mich., assignor to Burroughs Corporation, Detroit, Mich.

Filed May 7, 1975, Ser. No. 575,240
Int. Cl.² B25G 3/00; F16D 1/00; F16G 11/00
U.S. Cl. 403—408 1 Claim



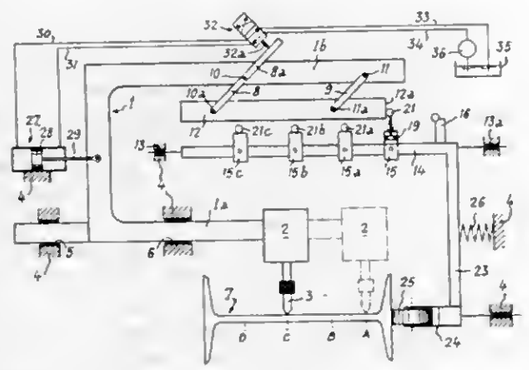
1. A fastening assembly for providing a readily predictable and substantially constant holding force comprising:
a thin-walled, hollow, cylindrical eyelet with a flanged head, the eyelet being formed of ductile, yet non-work hardening metal; and
a support member formed of a relatively rigid material and having formed therein an aperture with said eyelet received therein, the aperture being of such shape and dimension as to provide a plurality of discrete contact areas for the inserted eyelet in the aperture which interferingly contact the eyelet to create radial pressure sufficient to cause ductile yielding therein.

4,029,427

APPARATUS FOR POSITIONING TOOLS

Jean Cloup, 33360 Latresne, France

Filed Nov. 11, 1975, Ser. No. 631,159
Claims priority, application France, Dec. 24, 1974, 74.42695
Int. Cl.² B23B 29/08
U.S. Cl. 408—3 8 Claims



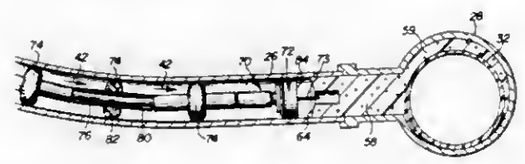
1. An apparatus for positioning a tool member in relationship to a workpiece which comprises:
guide means positioned in said apparatus;
a support member slidably mounted in said guide means and including said tool member disposed for movement in a parallel relationship to said workpiece; a controller member being supported for displacement from a normal position,
an actuator device mounted on said apparatus and operatively connected to said controller member for moving said support member relative to said workpiece upon said controller member being displaced from said normal position; and
a reference bar for determining the position of said workpiece, at least one pre-selector means mounted on said reference bar; and said preselector means being operative to displace said controller member from said normal position for effecting selective positioning of said tool with reference to said workpiece.

4,029,428

PIPE REPAIR APPARATUS

Joseph A. Levens, Richardson, Tex., assignor to Nipak, Inc., Dallas, Tex.

Division of Ser. No. 474,922, May 31, 1974, Pat. No. 3,950,461. This application Oct. 16, 1975, Ser. No. 622,952
Int. Cl.² B23B 47/02; B29D 27/04
U.S. Cl. 408—127 1 Claim



1. A cutting apparatus for use in interconnecting a relined main conduit to an intersecting service conduit wherein the main conduit has a liner positioned therein and wherein the area between the main conduit and the liner adjacent the intersection of the service conduit with the main conduit is filled with a foamable setting resinous material and the area adjacent the intersection of the service conduit and the main conduit is filled with a foamable setting resinous material, which comprises:
a cutter having a cylindrical cutting blade substantially conforming to the shape of said service conduit for forming a cylindrical opening, and shredding blade means positioned within said cylindrical cutting blade and axially away from said circular cutting edge for shredding material within said cylindrical cutting blade;
a drive shaft with the inner shaft attached to said cutter for transmitting power to the cutter at a remote location;
means adjacent the cutter for centrally positioning said cutter in the service conduit;
said positioning means comprising a plurality of lengths of tubing of a size to surround and axially slide along the exterior of said drive shaft, a portion extending from the exterior of each of said lengths of tubing for contacting and sliding along the walls of said service conduit, each of said extending portions defining an arcuate radially outward facing surface and having a maximum outside dimension in the radial direction slightly less than said service conduit; and
means for reciprocating said cutter within said service conduit whereby a port is formed between said service conduit and said liner.

4,029,429

BALL DRIVE NON-REVERSING TAPPING ATTACHMENT

Allan S. Johnson, 1400 Nottingham Road, Newport Beach, Calif. 92660

Continuation-in-part of Ser. Nos. 599,783, July 28, 1975, and Ser. No. 625,879, Oct. 28, 1975. This application May 24, 1976, Ser. No. 689,208
Int. Cl.² B23B 47/24; B23Q 1/46
U.S. Cl. 408—142 6 Claims

1. In coupling means for transmitting torque, in combination, a first rotating member, a second axially aligned member, said members being relatively movable axially, means for transmitting rotary drive from one member to the other, said means including at least one ball member positioned between the rotating members, both the rotating members having axial configurations engageable with the ball member whereby drive is transmitted through the ball member, the axial configurations on one of the rotating members being axial splines, said splines having an interruption therein, whereby after relative axial movement between the rotating members the ball member reaches the interruptions, the transmission of rotation is terminated, the rotating members being relatively movable axially into a position wherein the said ball member passes the interruptions and transmission of rotary drive is resumed.

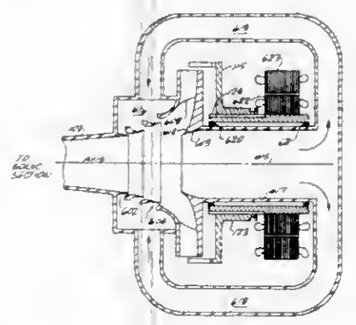
3. Coupling means as in claim 1, wherein the first rotating member is part of a tapping attachment adapted for rotation and to be moved axially, the second rotating member being the tapping spindle of the tapping attachment.

4,029,430

SHORT SUBSONIC DIFFUSER FOR LARGE PRESSURE RATIOS

Giusto Fonda-Bonardi, 2075 Linda Flora Drive, Los Angeles, Calif. 90024

Filed Sept. 2, 1975, Ser. No. 609,439
Int. Cl.² F01D 1/12
U.S. Cl. 415—53 R 10 Claims



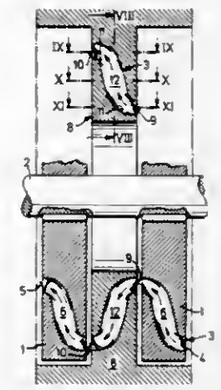
1. In a longitudinal divergent fluid diffuser, comprising means for converting a portion of the kinetic energy of a high velocity moving fluid in said diffuser into a higher pressure upon deceleration of the fluid stream wherein the diffuser includes means for preventing boundary layer detachment of the moving fluid along the divergent wall of the diffuser by increasing the momentum of the boundary layer in a direction parallel to the direction of longitudinal fluid flow by injecting a continuous thin layer of fluid along the diffuser wall through a slot immediately upstream of each point where the boundary layer detachment is likely to occur, means for collecting a central core portion of the high pressure decelerated fluid stream flowing in the diffuser in a central core region, away from the disturbed fluid flow near the diffuser wall, where the stagnation pressure has a value higher than the terminal pressure at the outlet of the diffuser and means for feeding back the collected high pressure central core portion fluid to said means for preventing boundary layer detachment, and means for introducing a high velocity fluid with said kinetic energy to be converted into the diffuser.

4,029,431

FLUID-FLOW MACHINE

Herbert Bachl, Stolzingstr. 4/IV, Munich 81, Germany

Filed Aug. 21, 1975, Ser. No. 606,706
Claims priority, application Germany, Aug. 23, 1974, 2440475
Int. Cl.² F04D 31/00
U.S. Cl. 415—69 4 Claims



4. A fluid-flow machine comprising:
a plurality of rotors;
at least one guide wheel located between said plurality of rotors;
said rotors each comprising a plurality of fluid-flow channels therethrough, each said fluid-flow channel comprising
rectangular shaped inlet and outlet openings on opposite sides of said rotor disposed at different distances from the axis of rotation of said rotor,
a tangential inlet channel portion including said inlet opening for receipt of a fluid-flow medium,
a tangential outlet channel portion including said outlet opening for discharge of the fluid-flow medium, and
a circular radial connecting section between said channel portions having curved opposite ends connecting said inlet portion to said outlet portion completely around the perimeter thereof;
each said channel portion having a direction, for directing the fluid-flow medium, which has a transverse and an axial component relative to the axis of rotation of the rotor, the axial components being in the same direction and the transverse components being in the opposite direction, said fluid-flow channels being formed so as to transform from the rectangular inlet and outlet channel portions into the curved cross-section in said radial connecting section;
said at least one guide wheel having fluid-flow channels in mirror image to the corresponding portions of said rotors and comprising inlets and outlets which are rectangular shaped in cross-section and a radial connecting section therebetween, said radial connecting section having a cross-section which is curved completely around the

perimeter thereof, the fluid-flow channels of said guide wheel forming a transition from the rectangular cross-section of the inlet and outlet openings thereof into the curved cross-section of the radial connecting section thereof.

4,029,432

THERMAL TURBOMACHINE

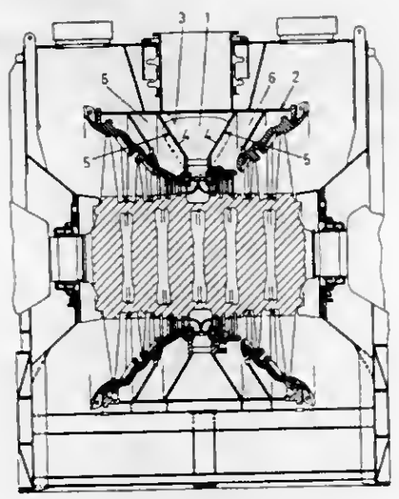
Pierre Meylan, Neuenhof, Switzerland, and Heinz Brunner, Waldshut, Germany, assignors to BBC Brown Boveri & Company Limited, Baden, Switzerland

Filed Nov. 11, 1975, Ser. No. 630,789

Claims priority, application Switzerland, Nov. 18, 1974, 15308/74

Int. Cl.² F01D *3/02*

U.S. Cl. 415—101 **10 Claims**



1. In a thermal turbomachine, such as a steam turbine, and which is provided with an intake duct that is delimited by the internal surface of an essentially rigid part of an inner housing surrounding the rotor and by the opposed surfaces of two rotationally symmetrical shells, the improvement wherein there are provided means to ensure a gastight seal during operations between said rigid part of said inner housing and each said shell and which comprise means providing axially spaced first sealing surfaces fixed to said rigid part of said inner housing, and means providing second sealing surfaces respectively on the peripheral portions of said shells, said first and second sealing surfaces being pressed against each other by the operating pressure of the fluid operating medium admitted to said turbomachine thereby to effect said gastight seal, and said first and second sealing surfaces having cooperating means capable of relative movement with respect one another and allowing a substantially unobstructed heat expansion by each said shell thereby to avoid any interaction between said shells and said inner housing related to thermal stresses and thermal deformation.

4,029,433

STATOR VANE ASSEMBLY

Robert Noel Penny, Solihull, and Peter Boden Candy, Bearley, near Stratford-upon-Avon, both of England, assignors to Caterpillar Tractor Co., Peoria, Ill.

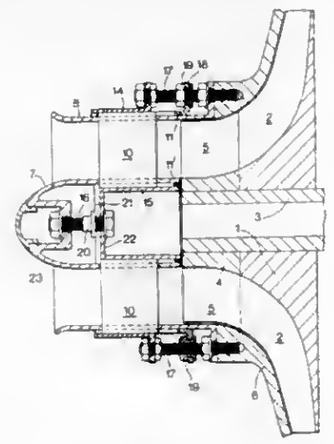
Filed Dec. 15, 1975, Ser. No. 640,688

Claims priority, application United Kingdom, Dec. 17, 1974, 54347/74

Int. Cl.² F01D *17/10*

U.S. Cl. 415—147 **8 Claims**

1. A stator vane assembly for a gas turbine engine, the stator vane assembly comprising a pair of radially spaced co-axial annular walls mounted co-axially of a rotor of the engine, a plurality of circumferentially-spaced flexibile stator vanes extending in a generally radial direction between said annular walls, an axially movable annular vane-deflecting member having a plurality of circumferentially-spaced surfaces formed thereon, each said surface embracing a respective one of said vanes over at least a substantial part of a working surface of said vane in the widthwise direction thereof, said surfaces on said vane-deflecting member and hence said working surfaces of said vanes being curved in the widthwise directions of said



vanes, and means to move said vane-deflecting member axially relatively to said vanes to embrace said working surface of each vane with a different part of a respective one of said surfaces of said vane-deflecting member to deflect said vanes in the widthwise directions thereof in the region of said vane-deflecting member.

4,029,434

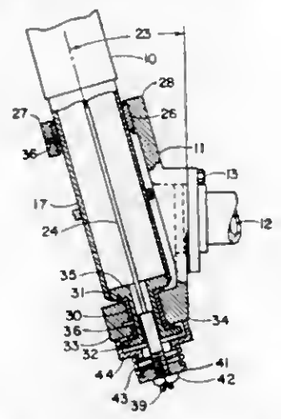
VARIABLE PITCH MOUNTING FOR AIRFOIL BLADES OF A WINDMILL OR PROPELLER

Clarence E. Kenney, 119 Stuart Road, Racine, Wis. 53406

Filed May 22, 1975, Ser. No. 579,822

Int. Cl.² F03D *7/04*

U.S. Cl. 416—41 **6 Claims**



1. An airfoil blade mounting comprising a hub rotatable about an axis, two co-axially disposed and spaced-apart sleeve bearings supported on said hub and having a common axis disposed offset from the axis of rotation of said hub and at an angle to the plane of rotation of said hub, an airfoil blade having two cylindrical portions at one end thereof and with said portions being respectively rotatably disposed in said sleeve bearings for rotation of said blade about its longitudinal axis for changing the pitch of said blade, said blade extending from said hub to the other end of said blade and with said blade being hollow along its length and terminating in a terminal end portion disposed away from said hub, said one end of said blade having two spaced-apart and mutually facing thrust surfaces disposed transverse to the longitudinal axis of said blade and in respective abutting relationship with said hub and in restrictive movement relative to said hub and along said longitudinal axis, a tension member extending through the hollow of said blade and having one end thereof connected with said terminal end portion of said blade and with the other

end of said tension member being anchored with said hub for supporting said blade against centrifugal force acting on said blade in the rotation of said blade and said hub about the axis of said hub and permitting the changes in pitch of said blade, and a spring operatively interconnected between said tension member and said hub and arranged to create a tensile force in said tension member to yieldingly restrain said blade against the influence of centrifugal force and thereby for yieldingly urging the radially inner one of said blade thrust surfaces away from abutting relationship with said hub, for rendering said blade free to rotate about its longitudinal axis in the changes in pitch of said blade.

4,029,435

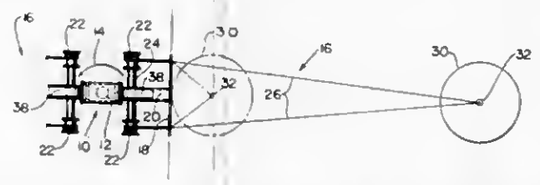
RETRACTABLE BLADE FOR A HELICOPTER ROTOR

Sidney L. Barker, 1211 N. Westshore Blvd., Tampa, Fla. 33607

Filed Jan. 29, 1976, Ser. No. 653,286

Int. Cl.² B64C *11/28*

U.S. Cl. 416—88 **6 Claims**



1. An aerodynamic rotor comprising, a rotor hub mounted for rotation about an axis, a blade mounted on said hub for rotation therewith, said blade including a blade member and a three dimensional, generally triangular truss; said truss including four flexible members and two rigid members each having opposite ends, a mid-portion of a first of said rigid members being attached to said hub and being generally transverse to said hub axis, a mid-portion of a second of said rigid members being attached to said blade member and being generally parallel to the hub axis, said flexible members forming pairs, said pairs each having spaced apart first ends, one for each of opposite ends of the first rigid member and secured thereto for free movement laterally thereof, said pairs each having a second end, one of the second ends being attached to one end of the second rigid member, and the other of the second ends being attached to the opposite end of said second rigid member, and means operable for rotating said hub about said axis at sufficient speed that operational loads create an excess of tension in all said flexible members and create a rigid three dimensional truss during operation of the rotor.

4,029,436

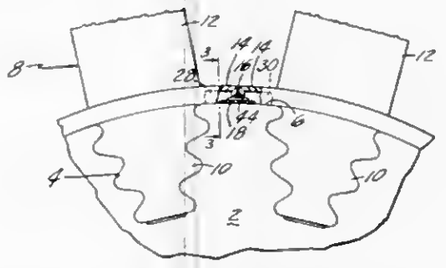
BLADE ROOT FEATHER SEAL

Edgar C. Shoup, Jr., Glastonbury, and Vincent Collettl, Jr., Rocky Hill, both of Conn., assignors to United Technologies Corporation, Hartford, Conn.

Filed June 17, 1975, Ser. No. 587,787

Int. Cl.² F01D *5/30*

U.S. Cl. 416—193 A **9 Claims**



1. A rotor construction including:

a disk having a plurality of axially extending blade root receiving slots in its periphery with peripheral lands between the slots,

a plurality of blades having roots positioned in the slots with blade platforms on each blade extending circumferentially toward the platforms on adjacent blades and overlying the peripheral lands, adjacent platforms terminating in closely spaced relation to one another, and

a thin flexible, flat seal element positioned between each land and the overlying blade platforms and extending across the space between the adjacent platforms, said seal having means thereon to locate each seal element axially of the disk, the undersides of the platforms having recesses therein to form narrow flanges adjacent the outer edges of the platforms to engage the seal element, the narrow flanges being significantly narrower than the seal element to reduce the area of the seal element engaged thereby.

4,029,437

TURBINE SHAFT HAVING INSERTED DISKS

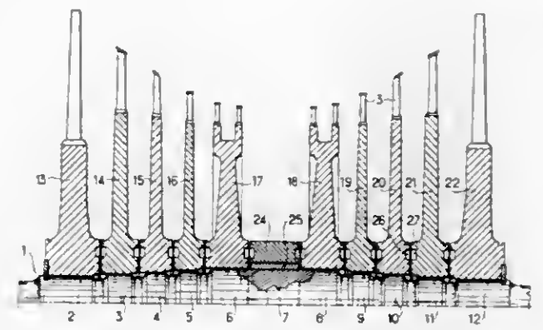
Pierre Aubry; Antoine Marques, and Rene Schwartz, all of Belfort, France, assignors to Groupe Europeen Pour La Technique Des Turbines a Vapeur G.E.T.T., Paris, France

Filed Dec. 10, 1975, Ser. No. 639,508

Claims priority, application France, Dec. 16, 1974, 74.41383

Int. Cl.² F01D *5/30*

U.S. Cl. 416—198 A **4 Claims**



1. In a turbine shaft having a succession of cylindrical bearings arranged in a stepped configuration, connected together by connecting surfaces of revolution and wherein a single disk is shrunk onto each cylindrical bearing and is unconnected to adjacent disks except through said shaft, the improvement wherein: each of said connecting surfaces of revolution comprises two conical surfaces, each of said conical surfaces starting from a respective one of the two successive cylindrical bearings being inclined at an angle of 30° to 60° to the axis of the shaft and tapering towards the axis of the shaft, a cylindrical surface being situated between said pair of conical surfaces and two toroidal surfaces connecting said cylindrical surface respectively to each one of the two conical surfaces, whereby, the zones of the shaft affected by shrinking stresses due to the shrinking of the individual disks to the individual cylindrical bearings is effectively separated from the zones affected by alternate bending stresses which lie intermediate of those zones affected by said shrinking stresses.

4,029,438

WELL POINT PUMPING SYSTEM AND PUMP ASSEMBLY THEREFOR

Albert H. Sloan, 4201 Kean Road, Fort Lauderdale, Fla. 33314

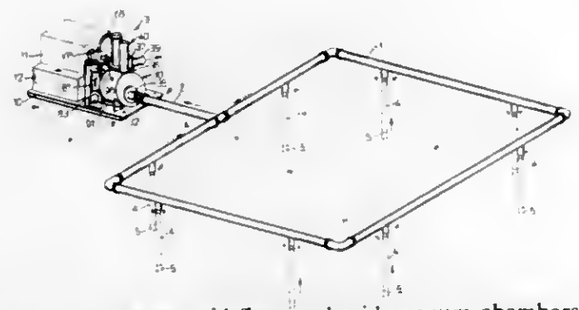
Filed Oct. 20, 1975, Ser. No. 623,655

Int. Cl.² F04D *9/00*; **F01C** *21/04*

U.S. Cl. 417—200 **13 Claims**

1. A well point pumping system comprising conduit means extending over an area of ground to be drained of water and

having well point means extending into the ground for extracting water therefrom, a pump assembly connected to said conduit means for pumping water from said conduit means, said assembly including a pump housing, an impeller type pump mounted in said housing and for causing water to flow through said conduit means and into said housing, said impeller pump including a rotatable pumping impeller member having curved vanes, and a stationary diffuser member surrounding said impeller and for receiving water discharged therefrom, said diffuser including curved vanes which curve in a direction opposite to said vanes of said impeller to thereby convert velocity of said water into static head; a float housing in fluid communication with and mounted on said pump housing and for receiving water therefrom, float means in said float housing and vertically shiftable in accordance with the water level in said housing, a vacuum chamber in communication with the float chamber of said float housing, a peller type valve



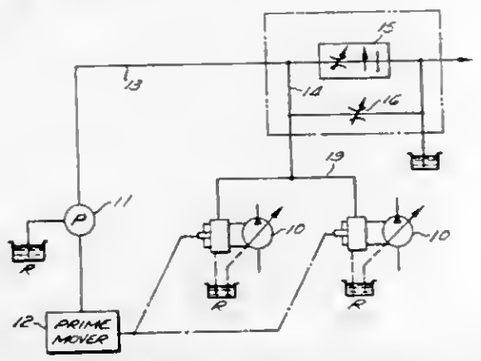
connected between said float and said vacuum chambers for permitting air to pass from said float chamber into said vacuum chamber, but for preventing water from entering said vacuum chamber from said float chamber, a discharge housing including a discharge valve in communication with said pump chamber and for permitting water to be pumped out of said pump chamber but preventing air from entering said pump chamber via said discharge chamber, power source means connected to said impeller pump for driving the latter in water pumping operation, a vacuum pump in air receiving communication with said vacuum chamber, oil and air separator means for receiving a mixture of oil and air from said vacuum pump, and oil circulating conduit means for flooding said vacuum pump with oil to thereby lubricate, seal, and cool said vacuum pump, a heat exchanger means in said pump housing and communicating with said vacuum pump for circulating oil thereto.

4,029,439

CONTROL SYSTEM FOR VARIABLE DISPLACEMENT PUMPS

Cecil E. Adams, Columbus, Ohio, assignor to Abex Corporation, New York, N.Y.

Filed Dec. 22, 1975, Ser. No. 642,868
Int. Cl.² F15D *31/02*; **F04B** *49/00, 1/26*
U.S. Cl. 417—216 **7 Claims**



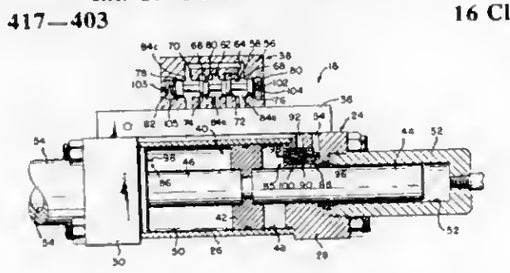
1. In a control for a hydraulic system which includes a prime mover, a plurality of variable displacement pumps driven thereby, each pump having a movable thrust plate, a fluid motor connected to the thrust plate which is operable to pivot the thrust plate between a position of maximum fluid displacement in one direction and a position of maximum fluid displacement in another direction and an independent control for selectively operating the fluid motor to move the thrust plate to thereby control the displacement of the pump, the improvement comprising a load sensing means, means connecting the load sensing means to the prime mover, the load sensing means having an output signal proportional to the load on the prime mover, each independent control including a rotary servo control valve which controls the fluid motor to selectively set the displacement of the pump, the rotary servo control valve having an input assembly which includes a rotary input shaft which sets the position of the fluid motor and the thrust plate to thereby set the displacement of the pump and the independent control further includes a variable ratio rotary input means connected to the rotary input shaft, second means connecting the variable ratio rotary input means to the output signal and the variable ratio rotary input means includes means for manually setting the position of the rotary input shaft to set the pump at a desired displacement and means responsive to said output signal for automatically changing the displacement of the pump in response to the output signal irrespective of the position of the manual setting means and each of said variable ratio rotary input means changes the displacement of its respective pump by the same percentage.

4,029,440

HIGH PRESSURE FLUID INTENSIFIER AND METHOD

John H. Olsen, Vashon, Wash., assignor to Flow Industries, Inc., Kent, Wash.

Continuation-in-part of Ser. No. 606,733, Aug. 21, 1975, abandoned, which is a continuation of Ser. No. 427,449, Dec. 26, 1973, abandoned, which is a continuation-in-part of Ser. No. 322,956, Jan. 12, 1973, Pat. No. 3,811,795. This application Mar. 16, 1976, Ser. No. 667,380
Int. Cl.² F04B *17/00, 35/00*
U.S. Cl. 417—403 **16 Claims**



1. A fluid pressure intensifying apparatus to provide a flow of a high pressure steam of an output fluid through a discharge nozzle, said apparatus comprising:
a. a working cylinder,
b. a working piston mounted in said working cylinder and separating said working cylinder into first and second working chambers, said working piston mounted in said cylinder for reciprocating motion in response to pressurized working fluid being directed alternately into said first and second working chambers,
c. high pressure output piston means operatively connected to said working piston so as to be moved along a reciprocating path thereby to deliver a high pressure flow of said output fluid,
d. a discharge nozzle to receive said high pressure flow from said output piston means, said discharge nozzle having an effective cross sectional flow area, with said discharge nozzle exerting a back pressure on said working fluid in said working chambers,
e. a control valve to direct pressurized working fluid from a working fluid source alternately to said first and second working chambers to cause the reciprocation of said working piston, said control valve comprising a valve element movable to:
1. a first position in which pressurized working fluid is directed to said first working chamber,
2. a second position in which pressurized working fluid is directed to said second working chamber,

3. an intermediate position through which said valve element passes in moving alternately between said first and second positions, said valve in said intermediate position having pressure reducing flow passage means to direct the pressurized working fluid from the working fluid source through said pressure reducing flow passage means, said pressure reducing flow passage means having an effective cross sectional area with a proportional relationship to the effective cross sectional flow area of the discharge nozzle and to the area of the working piston and the area of the high pressure piston, to produce a second back pressure of a value not substantially exceeding the back pressure resulting from transmission of power by said high pressure output piston means through said nozzle,

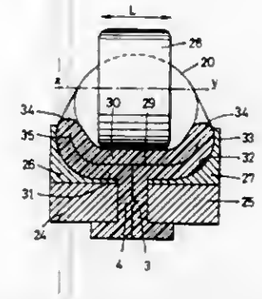
whereby potential pressure surges in said working fluid are alleviated in a manner that when flow of working fluid is increased or decreased to cause a corresponding increase or decrease of flow of said high pressure output fluid, the back pressure at both said pressure redicing flow passage and said nozzle increase or decrease correspondingly to alleviate potential pressure surges back in the working fluid.

4,029,441

TUBING MEANS FOR ROLLER PUMP

Lorenz Fischer, Kriens, Switzerland, assignor to Sermem S.A., Sion, Switzerland

Filed Apr. 22, 1975, Ser. No. 570,474
Claims priority, application Switzerland, Apr. 24, 1974, 5610/74; Apr. 24, 1974, 5611/74
Int. Cl.² F04B *43/08, 45/06*
U.S. Cl. 417—477 **14 Claims**



1. A volumetric pump comprising inlet and outlet couplings, each of said couplings having a circumferential groove therein, a flexible suction and delivery member, a support device for supporting said member, and a mobile arrangement cooperating with said support device for effecting a localized constriction of said member while moving cyclically along it, wherein said member is a flat, elastomeric section comprising two ends, two parallel side edges, and two securing appendages disposed along said edges, said appendages being fixed to said support device for keeping said section bent back upon itself in tubular form, the inner surface of said section having a rib parallel to and adjacent each of said two ends, and said two ends being respectively connected in a fluid-tight manner to said inlet and outlet couplings with said ribs respectively engaging in said grooves.

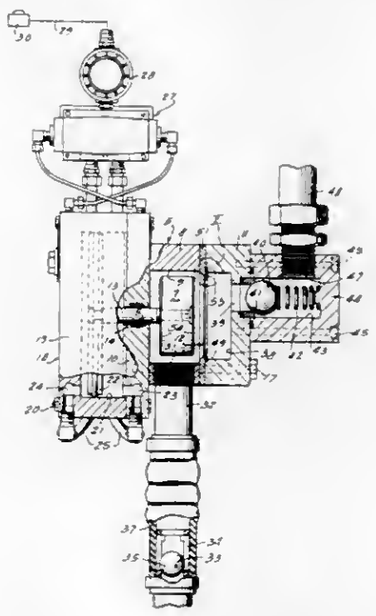
4,029,442

HIGH PRESSURE PISTON PUMP AND WIPER, SEALING, VALVING STRUCTURE

Paul W. Schlosser, Missouri City, Tex., assignor to Edward Bleiweiss, Houston, Tex.

Filed Aug. 19, 1975, Ser. No. 605,914
Int. Cl.² F04B *7/04*
U.S. Cl. 417—489 **4 Claims**

1. A pump for fluent materials and especially suitable for moving heavy fluent and abrasive materials, comprising:
a housing member providing a hollow cylinder chamber receptive of material to be pumped and having an axially extending chamber wall and opposite ends;
a piston within and shorter than the cylinder chamber and having its perimeter of smaller diameter than and in limited spaced gap relation to said wall so that material can flow through the gap;
a closure at one end of the cylinder chamber and means for guiding a piston rod of the piston for axial forward and return strokes of the piston relative to the opposite end of the cylinder chamber;
means for driving the piston rod and thereby the piston in said forward and return strokes;
a closure member and means securing the closure member to said housing member in closing relation to said opposite end of the cylinder chamber, and said closure member having a blind end chamber which forms a forward extension from the cylinder chamber and into which the piston extends a limited distance in the forward stroke of the piston, said blind end extension chamber being of a diameter which is larger than the diameter of the piston perimeter so that there is a limited spaced gap relation between the piston perimeter and said extension chamber when the piston extends into said extension chamber;
means for introducing into said cylinder chamber material to be pumped, and check valved means for receiving pumped material from said extension chamber;
a rigid annular ring plate clamped between said housing member and said closure member and having an inner annular rib portion which extends to a smaller diameter



than the diameters of the cylinder chamber wall and the extension chamber wall but to a larger diameter than the piston perimeter diameter, said rib portion defining a port through which the piston moves freely in a forward stroke from a position wherein the forward end of the piston is entirely within the cylinder chamber and clear of said rib portion; and
a combination valving, sealing and wiping elastic ring comprising a normally substantially flat elastic annular element fixedly clamped between said ring plate and said closure member and having an annular portion projecting radially inwardly beyond said rib portion to a substantially smaller diameter than the diameter of the piston perimeter, said elastic ring being engaged by the piston during the forward stroke through said rib portion and the piston elastically expanding the radially inwardly projecting portion of the elastic element into a tensioned sealing and wiping annular lip extending forwardly on the piston perimeter and maintaining pumping pressure in said blind end chamber against leakage past said rib flange during said forward stroke of the piston;
said rib portion serving as a backup for the elastic ring to prevent backward extrusion of the ring past the rib portion due to pumping pressure in said blind end chamber;
said piston producing a suction effect and developing a

negative pressure in said extension chamber during the return stroke of the piston whereby said lip expands and relieves its grip on the piston perimeter and diminishes the power load required to withdraw the piston from the lip during the return stroke;

said piston completely withdrawing from the elastic ring in said return stroke so that material can flow from said cylindr chamber past said piston and through said rib portion and said elastic ring into said blind end chamber in response to said negative pressure;

said lip providing the only surface in the pump with which the perimeter of the piston engages at any time and all other surfaces within the pump remaining at all times spaced from the piston perimeter.

4,029,443

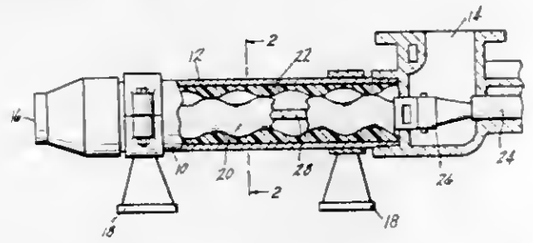
PROGRESSING CAVITY PUMP

Chester C. Burnside, Aiken, S.C., and John G. Wright, Coplay, Pa., assignors to Olin Corporation, New Haven, Conn.

Filed Nov. 27, 1974, Ser. No. 527,818

Int. Cl.² F01C *5/04*; **F04C** *1/06, 5/00*

U.S. Cl. 418—48 **2 Claims**



1. In a helical gear pump wherein an internally helically threaded resilient stator pumpingly coacts with an externally helically threaded rigid rotor, a rigid tubular casing embracing said stator, said casing having an inlet and an outlet, the improvement which comprises means to prevent said stator from rotating within said casing, said means being at least one rib attached along a portion of the inner wall of said casing, said rib being engagingly in contact within groove means in said stator, wherein said rib is curved, and in which said portion is from about 75 to about 100 percent of the length of said casing which is in contact with said stator.

4,029,444

SEALING BOLT SEAT FOR ROTARY PISTON MACHINE

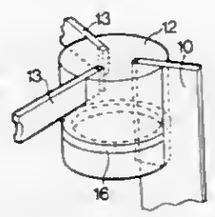
John Michael Clarke, Banbury, England, assignor to Caterpillar Tractor Co., Peoria, Ill.

Filed Oct. 10, 1975, Ser. No. 621,430

Claims priority, application United Kingdom, Oct. 10, 1974, 43855/74

Int. Cl.² F01C *19/08*

U.S. Cl. 418—120 **3 Claims**



1. A rotary piston machine having a rotor seal grid comprising a plurality of peripheral and apex seals and a cylindrical seal connector (herein called a "bolt") with which ends of said peripheral and apex seals engage, said bolt located with lateral clearance in a socket in the rotor, and having a circumferentially-extending slot in its circumferential surface, said seal grid also including an arcuate resilient seal located in said slot and extending circumferentially around said slot and engaging between the circumferential wall of said slot and the adjacent circumferential wall of the socket, whereby sealing is effected between the circumferential walls of the slot and the socket while permitting lateral movement and wobbling of said bolt in the socket.

4,029,445

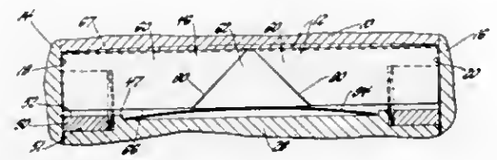
ROTARY COMBUSTION ENGINE APEX SEAL ARRANGEMENT

Jerry R. Mrlik, Birmingham, Mich., assignor to General Motors Corporation, Detroit, Mich.

Continuation of Ser. No. 591,752, June 30, 1975, abandoned. This application Aug. 11, 1976, Ser. No. 713,271

Int. Cl.² F01C *19/04*

U.S. Cl. 418—120 **4 Claims**



1. An apex seal arrangement for a rotary combustion engine having an inner peripheral wall and oppositely facing side walls and a rotor between the side walls with apexes that remain adjacent the peripheral wall as the rotor rotates, said apex seal arrangement comprising a pair of end segments arrangeable in a slot in each rotor apex with oppositely facing inner ends that leave a space therebetween and flat outer ends that face the respective side walls, a central segment arrangeable in the slot in each rotor apex in said space between the inner ends of said end segments, spring means between the bottom of the slot and said central segment only to provide a radially outward force on said central segment, all of said segments having a sealing surface on a radially outward side for contacting the peripheral wall and said end segments also having a sealing surface on their outer end for contacting one of the side walls, said inner ends of said end segments having ramps inclined at opposite and equal oblique angles to the peripheral wall and side walls, the sealing surface of each said end segment extending approximately half the width of said peripheral wall whereby a small gap is left between the oppositely facing inner ends of said end segments at said peripheral wall, said central segment having a shape generally corresponding to said space with a bottom facing the bottom of the slot and oppositely inclined flat sides positively engaging the respective end segment ramps and a top with the sealing surface thereon fitting within said small gap and always located above the top of the apex seal slot so that when a radially outward force is applied to said central segment the sealing surface thereon is urged toward engagement with the peripheral wall while said central segment sides operate on said end segment ramps to urge said end segments into sealing surface engagement with both the peripheral wall and respective side walls whereby the only possible leakage gap is in said small gap left between the oppositely facing inner ends of said end segments and remains substantially filled by said central segment top above the top of the apex seal slot, and said inclined sides of said central segment having a substantially steeper angle than said ramps of said end segments so that their engagement initially occurs adjacent opposite sides of said small gap at the low end of the engine's heat and pressure ranges and then as the peripheral wall changes in cross-wise contour with gas pressure and/or heat expansion and the end segments tilt to conform thereto the ramps and inclined sides then proceed toward full engagement along their interfaces.

4,029,446

SEALING ARRANGEMENT FOR GEAR-TYPE FLUID DISPLACING MACHINES

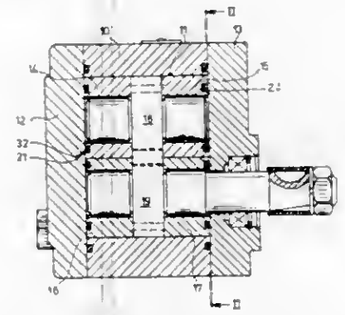
Siegfried Mayer, Vaihingen; Ivan Sauer, Schwieberdingen, and Jürgen Zorn, Korntal, all of Germany, assignors to Robert Bosch G.m.b.H., Stuttgart, Germany

Filed Dec. 31, 1975, Ser. No. 645,880

Claims priority, application Germany, Jan. 10, 1975, 7500496[U]

Int. Cl.² F01C *19/08*; **F03C** *3/00*; **F16J** *15/14*

U.S. Cl. 418—132 **18 Claims**



1. In a gear-type fluid displacing machine, a combination comprising a housing having a chamber and two side sections overlying opposite ends of the chamber; a pair of mating gears in said chamber for generating as they rotate a pressure area therein whose magnitude depends upon the loading and rotational speed of said gears, said gears having adjacent trunnions at said opposite ends of said chamber; annular bearing members surrounding said trunnions and each having an end facing one of said side sections and formed with a groove; and generally U-shaped resilient means in each of said grooves for sealing the latter as a function of the prevailing loading condition, said sealing means having legs which respectively engage one of said grooves and said side section which faces the latter in prestressed condition for normally sealing said grooves under no-load and slightly-loaded conditions due to the inherent resilience of said legs, and said legs in part bounding a space which is in communication with said pressure area so that under higher-loaded conditions said legs are pressed more firmly into sealing engagement therewith under the influence of pressure fluid entering from said pressure area into said space of said sealing means due to the increased magnitude of the force exerted by the pressure fluid entering from said pressure area under increased loading, whereby said grooves are sealed with different magnitudes of force which depend upon the prevailing loading condition.

4,029,447

RETREADING MOLD WITH NONPLOWING MATRICES CLOSING

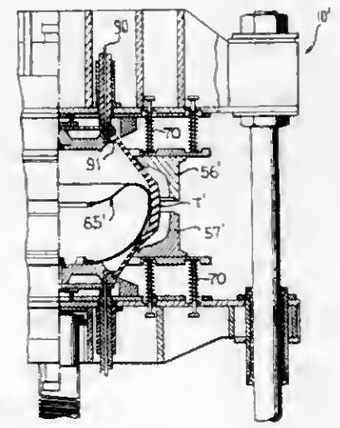
Kenneth T. MacMillan, 4992 Wesleyan Woods Drive, Macon, Ga. 31204

Division of Ser. No. 391,816, Aug. 27, 1973, Pat. No. 3,997,284. This application July 30, 1976, Ser. No. 710,131

Int. Cl.² B29H *5/04*

U.S. Cl. 425—21 **5 Claims**

1. A retreading mold comprising first and second relatively movable platens, means for imparting relative motion to said platens between first and second respective adjacent and remote relative positions, first and second matrices carried respectively by said first and second platens, first and second biasing means associated with said first and second platens and said first and second matrices for biasing said first and second matrices respectively away from said first and second platens, first and second bead aligner wheels carried respectively by said first and second platens, first and second means for respectively moving said first and second bead aligner wheels between first and second respective adjacent and remote positions, said matrices defining in the first position of said platens an annular chamber adapted to receive therein a tire to be retreaded, said matrices in the first position of said platens being in abutment with each other in a plane generally normal to the axis of said annular chamber, each bead aligner wheel having means for aligning a tire relative to said annular chamber by contacting beads of a tire, clamping means for internally bearing against each tire bead and clampingly urging each tire bead to an associated bead aligner wheel



whereby the diameter of the tire is reduced when said bead aligner wheels and matrices are in the second positions thereof, and control means for operating said motion imparting means to move said platens from their second position to their first position thereby forming said annular chamber prior to the movement of said bead aligner wheels from their second position to their first position whereby the tire returns to its normal diameter only after said matrices are closed.

4,029,448

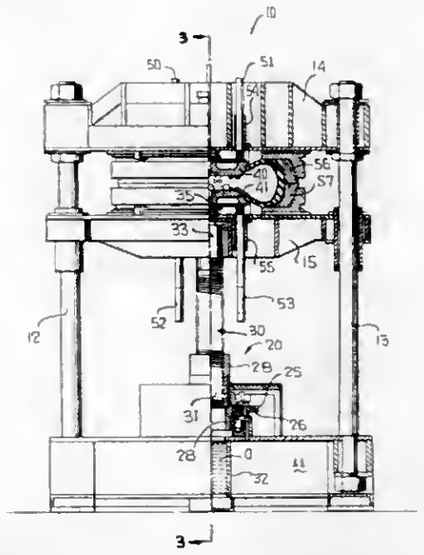
BEAD ALIGNER WHEELS WITH PROJECTION FOR RETREADING MACHINES

Kenneth T. MacMillan, 4992 Wesleyan Woods Drive, Macon, Ga. 31204

Division of Ser. No. 391,816, Aug. 27, 1973, Pat. No. 3,997,284. This application Aug. 2, 1976, Ser. No. 710,669

Int. Cl.² B29H *5/04*

U.S. Cl. 425—21 **8 Claims**



1. A retreading mold comprising first and second relatively movable platens, means for imparting relative motion to said platens to move the same between first open and second closed positions, first and second matrices carried respectively by said first and second platens and defining in the second position of said platens an annular chamber adapted to receive therein a tire to be retreaded, first and second bead aligner

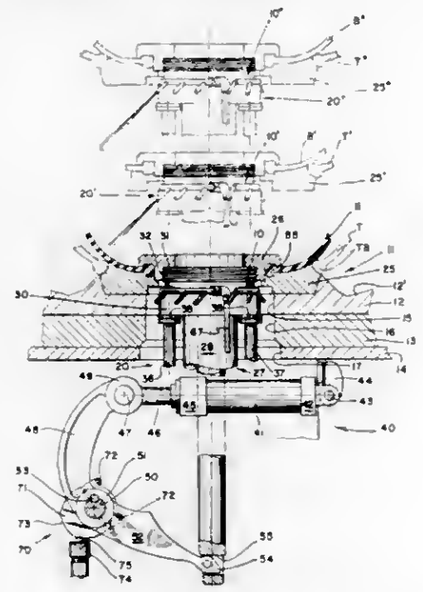
wheels carried respectively by said first and second platens adapted to engage the associated bead of a tire to be retreaded within said annular chamber, means for imparting relative motion between said bead aligner wheels to move the same between first adjacent and second more spaced apart positions, means carried by at least one of said bead aligner wheels for abuttingly contacting a second of said bead aligner wheels to preclude relative movement of said bead aligner wheels to a position less than that of said first adjacent position, an annular bladder having first and second innermost peripheral marginal portions, said first and second peripheral marginal portions contacting said first and second bead aligner wheels, respectively, and said abutting contacting means of said one bead aligner wheel is radially inboard of said first and second innermost peripheral marginal portions thereby aligning said bladder relative to said bead aligner wheels and preventing bladder pinching when said bead aligner wheels are in their first adjacent position.

4,029,449

MOLD BLOW OUT APPARATUS

Robert E. Longaberger, Marshallville Road, R.D. 1, Box 5, Marshallville, Ohio 44645

Filed July 14, 1976, Ser. No. 705,119
Int. Cl.² B29H *5/02*
U.S. Cl. 425—28 R **14 Claims**



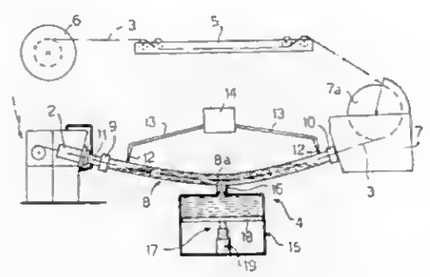
1. In a tire curing press having upper and lower mold sections and a center mechanism having a bladder and including a vertically movable hub carrying a ring for engaging the lower bead of a tire, mold blow out apparatus comprising, tubular means mounted exteriorly of the bladder on the movable hub of the center mechanism, conduit means communicating with and supplying pressurized fluid to said tubular means, and a plurality of nozzle means on said tubular means for directing the pressurized fluid into contact with the lower mold section to effect removal of residual foreign matter therein.

4,029,450

PLANT FOR VULCANIZING A CONTINUOUS LENGTH OF CURABLE MATERIAL ARTICLES OF ELASTOMERIC MATERIALS

Gustavo Caser, Gaglianico (Vercelli), Italy, assignor to Officine Termomeccaniche Successori Carello S.p.A., Gaglianico, Italy

Filed Apr. 18, 1975, Ser. No. 569,502
Claims priority, application Italy, Apr. 26, 1974, 68315/74
Int. Cl.² B29F *3/10*
U.S. Cl. 425—71 **27 Claims**



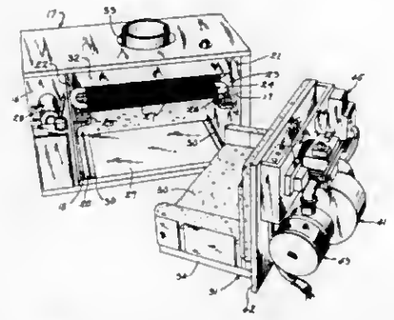
1. A plant for vulcanizing a continuous length of curable material, the plant comprising means defining a vulcanization chamber having a first region adapted to receive heat exchange liquid heated to a predetermined temperature, and at least one further region which communicates with said first region but is not invaded by said heat exchange liquid when said heat exchange liquid is received in said first region; fluid pressure means connected to said at least one further region to generate in said vulcanization chamber fluid pressure; and inlet means and outlet means provided at said at least one further region to allow passage of said material through said chamber in fluid tight manner.

4,029,451

GAS BURNING APPARATUS

Ken Farnia, East Lansing, Mich., assignor to A. O. Smith Corporation, Milwaukee, Wis.

Filed Feb. 3, 1975, Ser. No. 546,687
Int. Cl.² F24H *1/00*
U.S. Cl. 126—361 **14 Claims**



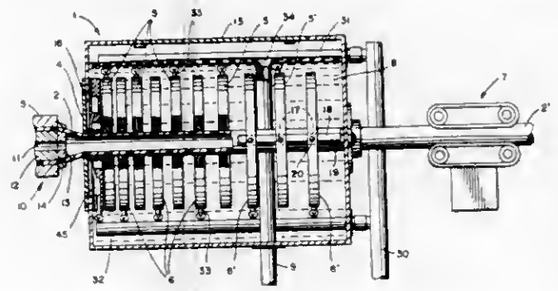
1. A gas burning apparatus, comprising housing means providing a combustion zone burning combustible gas, a burner unit operatively connected to said housing means and including a unit housing providing a substantially impervious channel having a first cross-sectional area located adjacent an inlet opening and a second cross-sectional area less than said first area located adjacent an outlet opening containing a perforated screen having a convex surface extending across said outlet opening and facing said combustion zone with at least one side edge of said screen movably retained by said housing, and means supplying combustible gas and air at a predetermined pressure to said first area of said channel provided by said burner unit with said unit channel increasing the velocity of mixed combustible gas and air to provide a gas velocity at said combustion zone greater than the flame propagation and maintaining the flame within said combustion zone in spaced relationship to said convex surface.

4,029,452

APPARATUS FOR CALIBRATING AN EXTRUDED THERMOPLASTIC TUBE

Heinz Schippers, Remcheid, and Gerhard Koslowski, Huckeswagen, both of Germany, assignors to Barmag Barmer Maschinenfabrik Aktiengesellschaft, Wuppertal, Germany

Filed Dec. 3, 1975, Ser. No. 637,369
Claims priority, application Germany, Dec. 3, 1974, 2456986
Int. Cl.² B29C *25/00*
U.S. Cl. 425—71 **17 Claims**



1. In an apparatus for the manufacture of an extruded thermoplastic tube including a vacuum tank partially filled with a liquid cooling medium to receive and cool the hot extruded tube and a plurality of draw plates with central openings as calibrating means aligned at spaced intervals within said tank along the axis of the extruded tube, the improvement which comprises:

a feed conduit for said liquid cooling medium opening tangentially into a ring channel contained within each draw plate around the central opening thereof; and

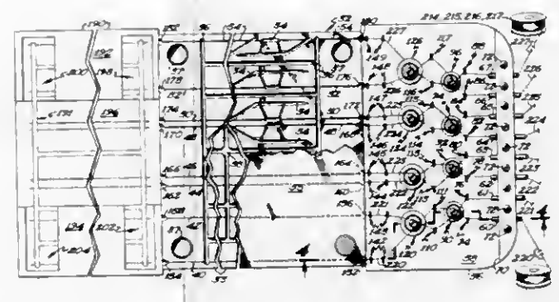
an annular liquid discharge slot extending inwardly from said ring channel toward the periphery of the tube.

4,029,453

MOLDING APPARATUS FOR MAKING A DENTAL FLOSS DEVICE WITH FLOSS TENSIONING MEANS

James M. Campion, Jr., Minnetonka, Minn., assignor to Philmon & Hart Laboratories, Inc., Bloomington, Minn.

Filed Nov. 4, 1974, Ser. No. 520,298
Int. Cl.² B29F *1/00*
U.S. Cl. 425—111 **13 Claims**



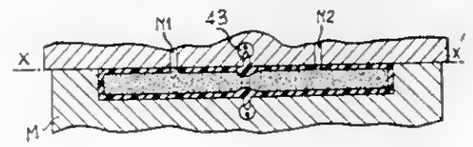
1. Apparatus for tensioning dental floss through a mold used in the production of a dental tooth cleaning instrument including a bow-shaped member having a first end and a second end and dental floss tensioned between the first and second ends, the mold being of the plastic-like material injection type including at least one line cavity for receiving the dental floss, comprising in combination: at least one source of dental floss; first means for holding the end of the dental floss; primary means for tensioning the dental floss in the mold during the injection of the plastic-like material into the mold; secondary means for supplementally tensioning the dental floss in the mold during the cool down period after the injection of the plastic-like material into the mold; second means for guiding the dental floss from the source of dental floss to the secondary tensioning means; and third means for guiding the dental floss into the line cavity of the mold for causing the dental floss to travel from the source, to the second means, through the secondary tensioning means, the primary tensioning means, the third means, and the mold, and to the first means.

4,029,454

INJECTION MOLDING MACHINE FOR COMPOSITE ARTICLES

Bernard Léon Monnet, "Mont Olivet", Bellignat, Ain, France

Filed Sept. 23, 1974, Ser. No. 508,568
Claims priority, application France, Sept. 25, 1973, 73.34327
Int. Cl.² B29F *1/10*
U.S. Cl. 425—130 **10 Claims**



1. An injection-molding machine for molding articles having at least locally, composite portions in which are found at least two materials of different compositions, one of which is coated by the other, said machine comprising:

a frame,

a mold supported on said frame including a fixed part and a movable part and having opposed surfaces at least one of which is movable toward and away from the other surface, said surfaces defining a joint plane for a mold cavity between said fixed and movable parts when the mold is closed, said mold including at least a pair of inlets to said mold cavity for delivering mold materials into said cavity with at least one of the fixed and movable parts of the mold having means providing for leakage of material outwards of said mold cavity in a plane substantially perpendicular to the joint plane,

at least two separate supply systems supported on said frame for injecting materials through said inlets into said mold cavity, and

a plurality of distributor means for the materials in communication with said mold cavity through said inlets, at least two of said distributor means each including a member movable for selectively and alternately connecting one or another of said separate supply systems with said mold cavity through a corresponding inlet to cause successive injection into the mold cavity of at least two materials of different compositions respectively, said inlets being spaced one from the other such that the successive injection of the two different materials through each inlet is provided at different locations within said cavity thereby initially forming a pair of discrete composite segments of said materials therein with one material forming a coating for a core formed of the other material in each segment, said leakage means being located between said inets and providing for flow of coating material outwardly of said mold cavity to enable the core material of each composite segment to unite one with the other upon formation of the final composite article.

4,029,455
APPARATUS FOR INTRODUCING STARTING MATERIALS INTO A SHEARING GAP OF A MACHINE FOR PRODUCTION OF FLAT STRUCTURES

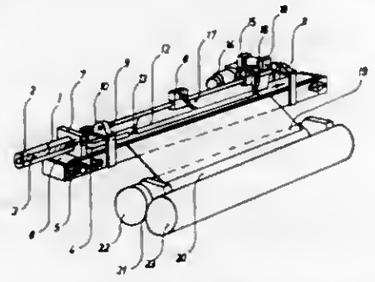
Herbert Schmidt, Offenback (Main); Joachim Herzel, Frankfurt am Main, and Dietrich Zickler, Muhlheim (Main), all of Germany, assignors to Zimmer Plastic GmbH, Frankfurt, Germany

Division of Ser. No. 264,398, June 15, 1972, abandoned. This application Feb. 26, 1975, Ser. No. 553,178

Claims priority, application Germany, Dec. 15, 1971, 2162229

Int. Cl.² B29C *15/00*

U.S. Cl. 425—142 **6 Claims**



1. An apparatus for introducing starting materials into a shearing gap of a machine for producing plastic films, ribbons, foils or plates, said shearing gap being bound on at least one long side by a heated turnable roller having a roller axis, comprising, in combination:

means for producing at least one endless plasticized string of said starting materials;

a conveyor belt positioned to withdraw said endless plasticized string from said producing means and to move said endless plasticized string to a predetermined position;

means for severing said endless plasticized string on said conveyor belt into substantially uniform string sections of a predetermined length, said conveyor belt moving said substantially uniform string sections into said predetermined position wherein said substantially uniform string sections are substantially parallel to said roller axis and above said shearing gap;

means for injecting said substantially uniform string sections into said shearing gap, said injecting means including a stripper adapted to engagingly remove said substantially uniform string sections from said conveyor belt and means for actuating said stripper in response to said substantially uniform string sections, said substantially uniform string sections being gravity fed into said shearing gap, said stripper being actuated whenever one of said substantially uniform string sections reaches said predetermined position.

4,029,456
RAPID LOAD-RELIEVE DEVICE FOR CONTINUOUS PRESS

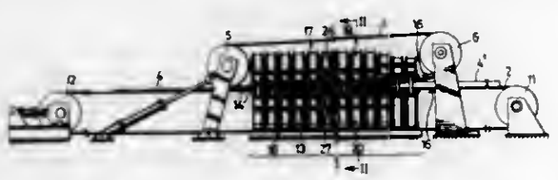
Karl-Heinz Ahrweiler, Krefeld, Germany, assignor to Eduard Kusters Maschinenfabrik, Krefeld, Germany

Filed Oct. 10, 1975, Ser. No. 621,382

Claims priority, application Germany, Oct. 31, 1974, 2451894

Int. Cl.² B29C *3/06*

U.S. Cl. 425—149 **10 Claims**



1. In a press having two press platens which are brought toward each other by at least one force exerting element utilizing a fluid medium under pressure, the elements designed to abut against a stop as long as a pre-determined operating pressure between the spans is not exceeded, the improvement comprising:

a. means for sensing the movement of the force exerting element away from the stop and providing an output indicative thereof; and

b. means responsive to the output of said sensing means for moving said press platens apart in a direction opposite to their normal operating direction.

4,029,457
MOLDING MACHINE

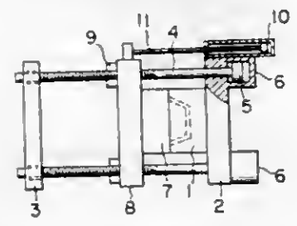
Rikichi Yamamoto, Numazu, Japan, assignor to Toshiba Kikai Kabushiki Kaisha, Tokyo, Japan

Continuation-in-part of Ser. No. 479,629, June 17, 1974, abandoned. This application Jan. 26, 1976, Ser. No. 652,111

Int. Cl.² B29C *3/06*

U.S. Cl. 425—167 **7 Claims**

PRIOR ART



1. In a molding machine including a stationary mold mounted on a stationary die plate, a movable mold carried by a movable die plate movable along at least one tie bar, a boost cylinder coupled to said movable die plate for moving and forcing said movable die plate toward and away from said stationary die plate, at least one mold tightening cylinder coupled to said tie bar for urging said movable mold against said stationary mold with a force greater in magnitude than said boost cylinder, and a locking member for locking said movable die plate to said tie bars, an improvement comprising electric contacts arranged and configured to be closed by the movement of said movable die plate before said movable mold engages said stationary mold, and electric actuating means energized by an electric signal generated by the closure of said contacts for actuating said locking member while said movable mold is still moving toward said stationary mold.

4,029,458
EXTRUSION DIE

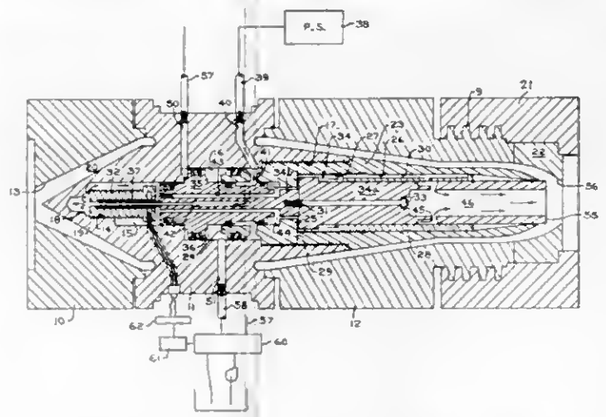
Heung Tai Kim, Avon Lake, and Gary F. Wilson, Grafton, both of Ohio, assignors to The B.F. Goodrich Company, Akron, Ohio

Filed June 24, 1975, Ser. No. 589,890

Int. Cl.² B29F *3/04*

U.S. Cl. 425—135 **4 Claims**

1. An extrusion die assembly comprising a housing having an inlet and an outlet opening, an elongated bore in said housing extending from said inlet to said outlet, a die head positioned at said outlet, a torpedo positioned within said bore with an end of the torpedo disposed adjacent said die head, said torpedo having a recess therein with an opening extending therefrom at the said one end of the torpedo, a mandrel slidably received by said recess of said torpedo with a portion of said mandrel extending through said opening to a location adjacent said die head, a piston on said mandrel within said recess and cooperative therewith to define a pair of spaced chambers, control means operatively connected to said chambers for selectively pressurizing one or the other of said chambers to control the position of said mandrel relative to said torpedo, said mandrel having an annular edge on the end thereof adjacent to said die head to control the wall thickness of the material being extruded, said control means includes sensing means comprising a transducer located in said recess



of said torpedo, and a magnetic core on said mandrel at the end thereof opposite said annular edge cooperative with said transducer to provide an output signal that is indicative of the relative position of said mandrel in said torpedo.

4,029,459
METHOD AND APPARATUS FOR MANUFACTURE OF GRANULATES FROM PULVERULENT, GRANULAR, DOUGHY OR SIMILAR MATERIAL

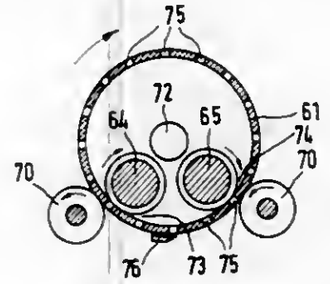
Jürgen Schmiedeke, Lage, Germany, assignor to Gunther Papenmeier KG, Maschinen-und Apparatebau, Detmold, Germany

Filed Jan. 20, 1975, Ser. No. 542,555

Claims priority, application Germany, Feb. 1, 1974, 2404813

Int. Cl.² B29B *1/04*

U.S. Cl. 425—202 **17 Claims**



1. Apparatus for producing granulates from pulverulent, granular, doughy or similar material, such as plastics, comprising: a plurality of members including means having closely adjacent but spaced apart rotating curved surfaces, providing an elongate nip zone where the rotating surfaces are approaching each other, means adjacent one of said curved surfaces for continuously feeding material into one portion of said nip zone; said rotating surfaces having surface formations structured to provide, at said zone, periodic and repeated kneading action on the material causing it to be formed as a skin and conveyed in the axial direction and along the length of the adjacent portions of the rotating surfaces; additional means, including one of said rotating surfaces, for receiving the material after a passage through said nip zone and structured so as to convey the material in the opposite direction as a skin on one of the rotating surfaces; means providing apertures in at least one of said members adjacent said nip zone and spaced axially from said portion of said nip zone where material is fed, said rotating structured surface formations providing a force on and, after alternate directions of movement of said material, causing kneaded material to pass through said apertures, and means located at the exit side of said apertures for granulating the material extruded from said apertures.

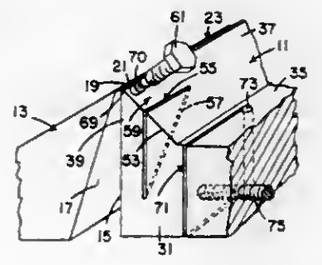
4,029,460
FLAT FILM EXTRUSION NOZZLE

Seddon C. Nelson, Fredericksburg, Va., assignor to FMC Corporation, Philadelphia, Pa.

Filed July 29, 1975, Ser. No. 600,175

Int. Cl.² B29F *3/04*

U.S. Cl. 425—466 **11 Claims**



1. An extrusion apparatus for shaping a flowable film-forming material into a stream of desired cross-section, said apparatus including a pair of elongated, oppositely disposed blades each having generally planar end walls, means supporting said oppositely disposed blades in fixed, spaced apart relationship whereby adjacent, exposed edges of said oppositely disposed blades together define an elongated extrusion orifice of generally uniform width, a corner of one of said blades, as defined by an end wall and an exposed surface extending between the end walls of said one blade, having a slot therein, said slot being open only along such one end wall and such exposed surface of said one blade and located in spaced relationship with said extrusion orifice as to permit that portion of said one blade which is between said slot and said extrusion orifice to be flexed, and means located adjacent to said corner for selectively deflecting said flexible portion of said one blade relative to the remainder thereof to thereby vary the width of the extrusion orifice at the end thereof.

4,029,461
FIBRE FELT FORMING AND CURING DIES

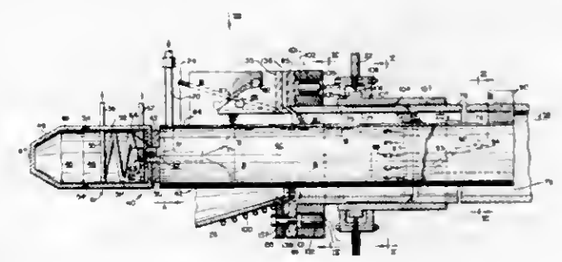
John W. Lacon, Sarnia, Canada, assignor to Fiberglas Canada Limited, Toronto, Canada

Filed Sept. 10, 1975, Ser. No. 612,166

Claims priority, application Canada, Aug. 29, 1975, 234475

Int. Cl.² B28B *21/42*

U.S. Cl. 425—384 **19 Claims**



1. A fibre felt forming die assembly, comprising:

means for longitudinally advancing a strip-shaped felt of fibrous material containing a heat-hardenable bonding material

a stationary elongate inner die having an external peripheral forming surface for sliding contact with a first surface of the advancing felt;

a stationary elongate outer die extending around said inner die;

said outer die having an internal peripheral forming surface for sliding contact with an opposite, second surface of the felt, said internal forming surface being spaced from said external forming surface on said inner die to define a gap for the advance of the felt between said internal and external forming surfaces;

said inner die comprising first and second inner die sections;

said first inner die section being disposed before said second inner die section in the direction of advance of the felt through the gap;

means for cooling said first inner die section to thereby cool the felt;

means for heating said second inner die section to thereby heat and at least partially cure the felt at and adjacent the first felt surface;

heat insulating means between said first and second inner die sections for counteracting the transference of heat from said second inner die section to said first inner die section, whereby the first felt surface undergoes a rapid temperature rise to partially cure the felt at and adjacent the first felt surface as the felt advances past said inner die; and

means for discharging hot gas through the entire thickness of the felt to further cure the felt.

4,029,462

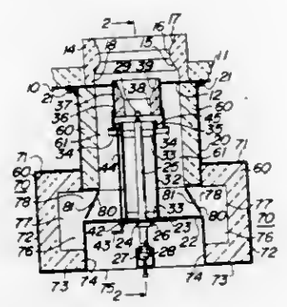
BURNER WITH NOISE SUPPRESSOR

Gordon M. Bitterlich, Tredyffrin Township, Chester County, Pa., assignor to National Airoil Burner Co., Inc., Philadelphia, Pa.

Filed Dec. 10, 1975, Ser. No. 639,572

Int. Cl.² F23C *7/04*

U.S. Cl. 431—114 **10 Claims**



1. Combustion apparatus for negative draft furnaces having an opening in a wall of the furnace with a pressurized oil burner and pressure gas burners in communication therethrough with the interior of the furnace,

a housing extending outwardly from said furnace for said burners and for air supply to said burners,

said housing having wall portions providing an air passageway communicating with said opening,

said wall portions having sound absorptive linings,

said burners being disposed within said housing and spaced from said wall portions,

said housing also having wall portions offset therefrom providing a tortuous air path communicating with said air passageway and with an air inlet opening to the atmosphere at the outer extremity thereof for air supply to the burners,

said offset wall portions having sound absorptive linings,

the tortuous path and the sound absorptive linings of said wall portions and said offset wall portions attenuating outwardly emitted high frequency fluid flow noise and low frequency combustion noise from the furnace opening by multiple reflection by the wall portions and offset wall portions and absorption by the sound absorptive linings.

4,029,463

METHOD FOR BAKING FOOD PRODUCTS

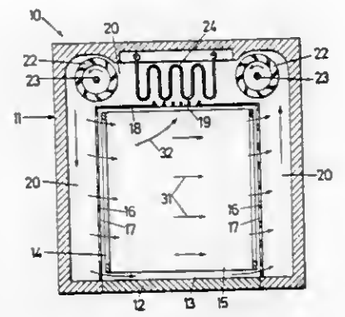
Leif A. T. Johansson, Huddinge, and Nils G. Pers, Upplands Vasby, both of Sweden, assignors to Tipe Revent AB, Stockholm, Sweden

Division of Ser. No. 434,681, Jan. 18, 1974, Pat. No. 3,905,760. This application Aug. 13, 1975, Ser. No. 604,094

Claims priority, application Sweden, Jan. 26, 1973, 7301135

Int. Cl.² F27D *7/00*

U.S. Cl. 432—25 **6 Claims**



1. A method of baking food products supported on superimposed horizontal racks in a chamber, the chamber being defined in part by opposed vertical apertured side walls and an intermediate vertical apertured side wall, comprising:

a. during a first main phase of a baking cycle, causing air to flow horizontally through one of the opposed side walls into the chamber, and to leave the chamber horizontally through both the other opposed side wall and the intermediate vertical side wall;

b. during a second main phase of the baking cycle, causing air to flow horizontally through said other opposed side wall into the chamber, and to leave the chamber horizontally through both said one opposed side wall and the intermediate vertical side wall; and

c. repeating said baking cycle until the food products are baked sufficiently.

4,029,464

ROTARY KILN FOR PRODUCING A BLOATED CLAY PRODUCT

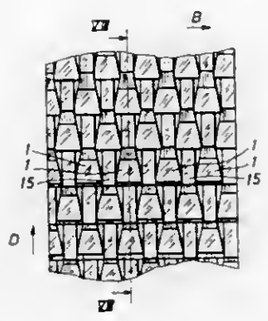
Harry Kamstrup-Larsen, Vanlose, Denmark, assignor to Leca Trading & Concession A/S, Copenhagen, Denmark

Filed Sept. 15, 1975, Ser. No. 613,555

Claims priority, application Denmark, Sept. 13, 1974, 4825/74

Int. Cl.² F27B *7/14*

U.S. Cl. 432—118 **16 Claims**



1. A rotary kiln for producing a bloated clay product on clay or clay slate, and comprising a tubular drying-kiln section slowly rotating about its axis and a tubular burning-kiln section which rotates relatively rapidly about its axis, said burning-kiln section being arranged adjacent the drying-kiln section with the rear part of the drying-kiln section being adjacent and in communication with the front part of the burning-kiln section, the rear part of the drying-kiln section and the front part of the burning-kiln section forming a transition zone, said transition zone having a lining which contains shovel-shaped bricks, each shovel-shaped brick comprising a portion projecting inwardly towards the center-line of the kiln, the projecting portion being defined by a top surface substantially perpendicular to a radius of the kiln, a plurality of inclined surfaces extending from said top surface, such inclined surfaces including a front surface inclined in relation to the tangential direction of the kiln, two side surfaces, and a rear surface.

4,029,465

ENERGY CONSERVING PROCESS FURNACE SYSTEM AND COMPONENTS THEREOF

Paul G. LaHaye; John W. Bjerklie, both of Cape Elizabeth, and Gerald G. Gallant, Jr., Gorham, all of Maine, assignors to Hague International Corporation, So. Portland, Maine

Filed Feb. 6, 1975, Ser. No. 547,381

Int. Cl.² F27D *17/00*

U.S. Cl. 432—179 **10 Claims**

1. An energy conserving process furnace comprising,

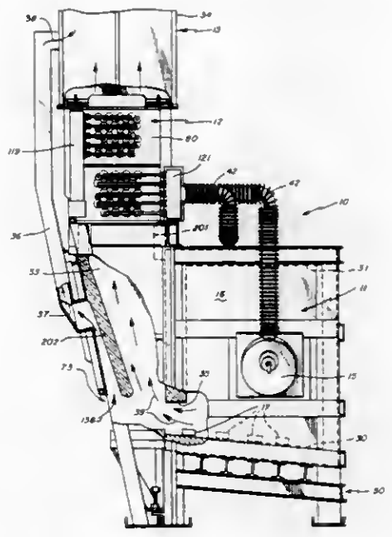
a combustion zone defined by heat insulated combustion chamber walls,

a fluid fuel burner comprising a fuel nozzle for heating said combustion zone to a temperature above 1300° F,

an exhaust passage from said combustion zone leading to an exhaust port through an exhaust stack,

a ceramic heat recuperator positioned in said stack and carrying means for heating combustion air for said burner by extracting heat energy from exhaust gas derived from said combustion zone,

said fluid fuel burner being a recirculating burner having means for recirculating hot gases from said combustion



zone through said burner and mixing said combustion air with said recirculating hot gases.

4,029,466

CONTAINER FOR EVAPORATION OF METAL

Masaji Ishii; Akio Mikogami, and Akira Miyai, all of Machida, Japan, assignors to Denki Kagaku Kogyo Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 8, 1975, Ser. No. 603,140

Claims priority, application Japan, Aug. 8, 1974, 49-90972; Aug. 8, 1974, 49-90971

Int. Cl.² F27B *14/10, 14/06*

U.S. Cl. 432—264 **6 Claims**

1. A container for the evaporation of metal which comprises:

an electrically conductive ceramic base whose surface in contact with the molten metal is coated with a film comprising a main component selected from the group consisting of tungsten, tantalum and molybdenum metal.

4,029,467

SUBLIMATION TRANSFER AND DIISOCYANATE FIXATION OF AMINO- OR HYDROXY-CONTAINING AZO DYESTUFFS AND TRANSFER SHEETS THEREOF

Raymond Defago, Riehen; Hans-Joerg Angliker, Basel; Herbert Holzrichter, Muri; Werner Kneubuehler, Binningen, and Richard Peter, Basel, all of Switzerland, assignors to Ciba-Geigy AG, Basel, Switzerland

Continuation of Ser. No. 398,896, Sept. 19, 1973, abandoned, which is a division of Ser. No. 245,648, April 19, 1972, Pat. No. 3,782,896. This application Jan. 8, 1976, Ser. No. 647,478

Claims priority, application Switzerland, Apr. 26, 1971, 6069/71

Int. Cl.² D06P *5/06*

U.S. Cl. 8—2.5 A 30 Claims

1. A transfer printing process for the manufacture of prints on a textile or non-textile, hydrophobic sheet which prints are heat-fast to wet processing, comprising the steps of

a. applying to an auxiliary carrier web a sublimable azo dyestuff containing a hydroxyl group, an amino group or both,

b. transferring said dyestuff to said sheet by heat-induced sublimation of diffusion from said auxiliary carrier web,

c. subsequently providing to the printed area of said sheet an isocyanate compound, having at least two isocyanate groups per molecule, and which is capable of reacting with said dyestuff and fixing the dyestuff to the printed area of said sheet by reaction therewith.

25. An auxiliary carrier web for use in heat-transfer printing, consisting essentially of flexible sheet material carrying (1) sublimable disperse azo dyestuff containing a hydroxyl group, an amino group or both, and (2) a masked isocyanate compound which decomposes to liberate an effective fixing amount of an isocyanate having at least two isocyanate groups per molecule, at a temperature no greater than 240° C, wherein the sublimation temperature of the dyestuff is at least 10° C lower than the decomposition temperatures of the masked isocyanate.

4,029,468

TRANSFER DYES

Karl Maier; Fritz Graser, and Guenter Meyer, all of Ludwigshafen, Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen (Rhine), Germany

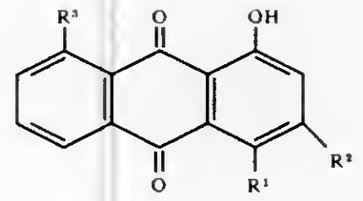
Filed June 2, 1975, Ser. No. 582,727

Claims priority, application Germany, July 4, 1974, 2432149

Int. Cl.² B41C *1/06;* D06P *1/22*

U.S. Cl. 8—2.5 A 5 Claims

1. A dye formulation for transfer printing containing in addition to conventional ingredients a dye of the formula



in which

R^1 is chloro,

R^2 is hydrogen, and

R^3 is hydrogen.

4,029,469

COLORING PROCESS FOR SYNTHETIC TEXTILE MATERIALS

Violet Boyd; Brian Ribbons Fishwick, and Brian Glover, all of Manchester, England, assignors to Imperial Chemical Industries Limited, London, England

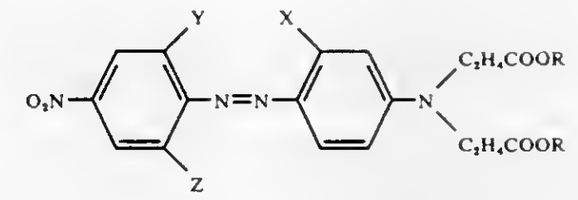
Filed Oct. 8, 1975, Ser. No. 620,692

Claims priority, application United Kingdom, Oct. 31, 1974, 47112/74

Int. Cl.² C09B *27/00;* D06P *1/02*

U.S. Cl. 8—41 C 2 Claims

1. Process for colouring aromatic polyester textile materials which comprises applying to the said textile material by an aqueous dyeing, padding or printing process an aqueous dispersion of a water-insoluble monoazo dyestuff of the formula:



wherein X is hydrogen or methyl, Y and Z are each independently chlorine or bromine, and R is lower alkyl, and subsequently subjecting the coloured textile material to a treatment in an aqueous solution containing from 0.05 to 0.5% of sodium hydrosulphite at a temperature of from 50° to 85° C.

4,029,470

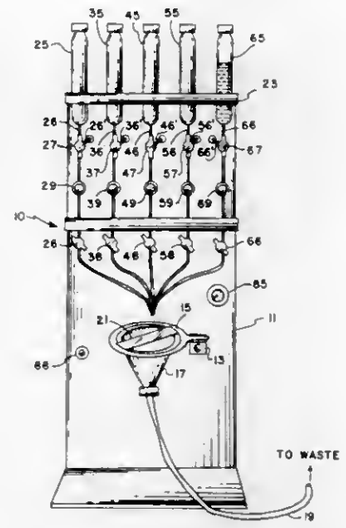
AUTOMATED SINGLE-SLIDE STAINING DEVICE

Judd R. Wilkins, and Stacey M. Mills, both of Hampton, Va., assignors to The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.

Filed Oct. 29, 1975, Ser. No. 626,942

Int. Cl.² D06P *3/00*

U.S. Cl. 8—94.11 18 Claims



1. Apparatus for making laboratory Gram stains of Gram-positive and Gram-negative bacteria on individual inoculated slides comprising:

an inoculated laboratory slide and support means for receiving and supporting the slide,

a plurality of liquid dispersing means each having a discharge outlet constructed and arranged to flood said inoculated slide with liquid,

waste collector and discharge means extending from said support means for receiving the liquid from said plurality of liquid dispersing means when said slide is flooded thereby,

individual valve means for each of said plurality of liquid dispersing means,

individual actuator means for selectively opening and closing each of said valve means,

timing means connected to and, when initiated, serving to sequentially actuate said individual actuator means to sequentially open and close each of said valve means in a predetermined sequence to flood said inoculated slide with increments of a primary stain, a mordant, a decolorizer, a counterstain and a wash solution, and

means for initiating said timing means.

14. A method of making laboratory Gram stains of Gram-positive and Gram-negative bacteria on individual inoculated slides comprising:

inoculating a laboratory slide with bacteria,

fixedly positioning the inoculated slide over a waste collector,

providing a plurality of liquid dispersing containers each individually housing a primary stain, a mordant, a decolorizer and a wash solution and each having a discharge outlet constructed and arranged to flood said inoculated slide,

automatically flooding the inoculated slide with sequentially timed increments of a primary stain, a mordant, a decolorizer, a counterstain and a wash solution, and

recovering a Gram stain slide.

4,029,471

PROCESS FOR SIMULTANEOUSLY FLAMEPROOFING AND SHRINKPROOFING WOOL

Nathan H. Koenig, Albany, and Mendel Friedman, Moraga, both of Calif., assignors to The United States of America, as represented by the Secretary of Agriculture, Washington, D.C.

Filed Apr. 14, 1976, Ser. No. 676,948
Int. Cl.² D06M *13/20, 13/42*
U.S. Cl. 8—128 R **3 Claims**

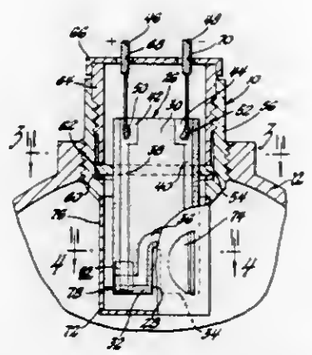
1. A process for preparing flameproof and shrinkproof wool by simultaneously reacting the wool with a halogenated acid anhydride and an isocyanate in the presence of cresol.

4,029,472

THERMOELECTRIC EXHAUST GAS SENSOR

Adolph L. Micheli, and Dennis F. Dungan, both of Mount Clemens, Mich., assignors to General Motors Corporation, Detroit, Mich.

Filed Apr. 5, 1976, Ser. No. 673,649
Int. Cl.² G01N *39/02*
U.S. Cl. 23—254 E **5 Claims**



1. In an internal combustion engine exhaust system having a conduit for directing a stream of exhaust gases, a durable and high output thermoelectric exhaust gas sensor in said conduit for detecting residual combustibles in said exhaust gas stream, said sensor comprising:

an electrically nonconductive ceramic element having a body portion and two integral mutually spaced legs, said legs serving as a support for at least two interconnected high output thermocouple junctions;

a continuous coating of doped titanium dioxide on said element extending from an extremity of one leg to an extremity of the other leg via said body portion, said titanium dioxide coating containing a dopant that is a pentavalent ion from Group V of the Periodic Table of the Elements and having a large negative Seebeck coefficient;

a first continuous coating of lithia-nickel on said element extending from said body portion to one leg extremity where it contacts said doped titanium dioxide coating, said lithia-nickel coating having a large positive Seebeck coefficient and forming a first high output thermocouple junction with said doped titanium dioxide coating at said one leg extremity that is resistant to corrosive and abrasive effects of an internal combustion engine exhaust gas stream;

a second continuous coating of lithia-nickel on said element extending from said body portion to the other leg extremity where it contacts said doped titanium dioxide coating, said second lithia-nickel coating having a large positive Seebeck coefficient similar to said first lithia-nickel coating and forming a second high output thermocouple junction with said doped titanium dioxide coating at said other leg extremity that is resistant to corrosive and abrasive effects of an internal combustion engine exhaust gas stream;

a coating of catalytic ceramic particles on only one of said leg extremities closely adjacent the one thermocouple junction thereon and providing a high surface area situs for exothermic reaction of residual combustibles in an internal combustion engine exhaust gas stream;

means attached to said body portion for mounting said element in an exhaust system conduit and uniformly exposing both leg extremities, including said first and second thermocouple junctions, to the exhaust gas stream whereby residual exhaust gas combustibles can react with said catalytic ceramic particles adjacent the one thermocouple junction and produce a temperature differential between it and the other thermocouple junction;

means on said body portion, spaced from said doped titanium dioxide coating, for making separate electrical connections to said first and second lithia-nickel coatings; and

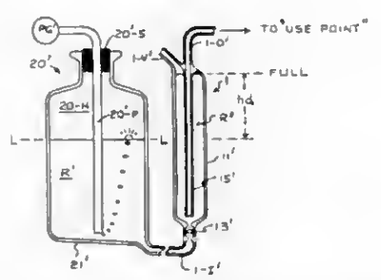
means for isolating said electrical connections from exhaust gas in said exhaust system conduit so that said electrical connections are not deleteriously affected while said thermocouple junctions are exposed to said exhaust gas stream.

4,029,473

VESTIBULE VALVE REAGENT DISPENSER

Thomas Davy Sharples, Atherton, Calif., assignor to Beckman Instruments, Inc., Fullerton, Calif.

Filed Oct. 31, 1975, Ser. No. 627,803
Int. Cl.² B65D *83/00, 83/14*
U.S. Cl. 23—259 **11 Claims**



1. In an automatic liquid dispensing apparatus of the type having a closed storage vessel for containing a large quantity of liquid and having a bottom, means connected to said storage vessel for pressurizing said vessel, and fluid communication means having a first end and a second end, said first end connected to said storage vessel and said second end defining a discharge point, characterized in that said fluid communication means further comprises:

a. a closed intermediate vessel for containing a small quantity of said liquid and having a bottom,

b. pressurizing means connected to said intermediate vessel for periodically pressurizing liquid therein to expel said liquid therefrom, and

c. fluid control means for allowing passage of liquid from said storage vessel to said intermediate vessel when the pressure head in said storage vessel is greater than the pressure head in said intermediate vessel and restricting passage of liquid from said intermediate vessel to said storage vessel when the pressure head in said intermediate vessel is greater than the pressure head in said storage vessel.

4,029,475

BLANK FOR ROLLING AND FORGING AND METHOD OF PRODUCING SAME

Yoshihiko Hamai, Kawasaki; Tatsuro Hamai, Tokyo; Yuya Tanaka, Machida, and Akira Nakatani, Niiza, all of Japan, assignors to Kabushiki Kaisha Hamai Seisakusho, Tokyo, Japan

Filed Dec. 12, 1974, Ser. No. 532,247
Claims priority, application Japan, Dec. 31, 1973, 49-000822; June 8, 1974, 49-065410
Int. Cl.² B22F *3/00;* **C22C** *1/04*
U.S. Cl. 75—247 **9 Claims**

1. The method of making a sintered compact which comprises the steps of

adding to the initial metal powder consisting principally of copper and zinc at least one compound containing an additive metal selected from the group consisting of alkali metals and alkaline earth metals, and thereby producing a mixture consisting essentially of said at least one compound, copper and zinc,

annealing said mixture at a temperature higher than the decomposition temperature of said compound,

and then compacting and sintering said mixture,

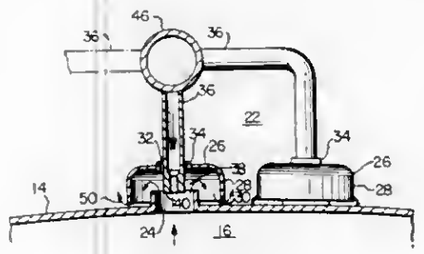
said at least one compound being of a type which decomposes into at least one gas which has no corrosive effect on said initial metal power, together with at least one substance selected from the group consisting of said additive metals and their oxides which substance forms a coating on said initial metal powder during said annealing step which inhibits subsequent volatalization of said zinc during said sintering step.

4,029,474

COAL LIQUEFACTION REACTOR DISTRIBUTION SYSTEM

Morgan C. Sze, Upper Montclair, and Harold B. Kohn, Cedar Grove, both of N.J., assignors to The Lummus Company, Bloomfield, N.J.

Filed June 3, 1976, Ser. No. 691,916
Int. Cl.² B01J *8/00;* **C10G** *1/06*
U.S. Cl. 23—285 **11 Claims**



1. A reactor for the liquefaction of coal comprised of:

a container divided by a partitioning head into a first and a second chamber;

a first plurality of tubes through said partitioning head communicating between said chambers and extending from said partitioning head into said second chamber;

a plurality of circular caps each of said caps individually positioned adjacent the extended end of one of said first tubes, concentric thereto, and spaced therefrom, said caps having a greater diameter than said first tubes;

a second plurality of tubes each of said second tubes concentrically aligned with one of said tubes, the end of each said second tube adjacent the extended end of said first tube;

inlet means for entry of pressurized material into said first chamber; and

inlet means for supplying pressurized material to said second plurality of tubes.

4,029,476

BRAZING ALLOY COMPOSITIONS

Walter V. Knopp, Wyckoff, N.J., assignor to A. Johnson & Co. Inc., New York, N.Y.

Filed Feb. 12, 1976, Ser. No. 657,691
Int. Cl.² B22F *3/00;* **C22E** *33/00*
U.S. Cl. 428—676 **13 Claims**

1. A brazing alloy composition consisting essentially by weight of about 30 to 50% copper, about 10 to 20% manganese, about 3 to 25% iron, about 0.5 to 4% silicon, about 0.5 to 2% boron and the balance essentially nickel ranging from about 30 to 50%, said alloy when employed to produce a brazed joint being characterized by improved ductility.

4. A brazed metal joint comprised of metal parts with a fused brazing alloy interposed therebetween joining said parts together into a strong joint, said fused brazing alloy consisting essentially by weight of about 30 to 50% copper, about 10 to 20% manganese, about 3 to 25% iron, about 0.5 to 2% boron, about 0.5 to 4% silicon and the balance essentially nickel ranging from about 30 to 50%, the fused braze alloy at the joint being characterized by improved ductility.

10. A powder brazing alloy composition mixture consisting essentially of an alloy powder of Cu-Mn-Ni-Si-B mixed with an iron powder such that the average composition of the alloy powder-iron powder mixture consists essentially of about 30 to 50% copper, about 10 to 20% manganese, about 3 to 25% iron, about 0.5 to 4% silicon, about 0.5 to 2% boron, and the balance essentially nickel ranging from about 30 % to 50%, said powder when compressed into a green blank being characterized by improved green strength as compared to the alloy powder without iron powder present.

4,029,477

COATED Ni-Cr BASE DISPERSION-MODIFIED ALLOY ARTICLE

John J. Grisik, Middletown, Ohio, assignor to General Electric Company, Cincinnati, Ohio

Filed Oct. 29, 1975, Ser. No. 626,653
Int. Cl.² B32B 15/00
U.S. Cl. 428—680 4 Claims

1. A coated NiCr base dispersion-modified alloy article of improved resistance to oxidation and sulfidation comprising:
a dispersion-modified base alloy consisting essentially of, by weight, 15 – 30% Cr, 0.01 – 10% of oxides selected from the group consisting of oxides of the rare earth elements, up to about 1% of elements selected from the group consisting of Ti and Al, with the balance Ni and incidental impurities; and
a coating on the base alloy and consisting of, by weight, about 8 to less than about 14% Al, and 15 – 30% Cr, about 0.01 – 10% of elements selected from the group consisting of Y and Hf, with the balance Ni and incidental impurities;
the difference between the Cr content of the base and Cr content of the coating being no greater than about 10 weight percent.

4,029,478

Zn-Al HOT-DIP COATED FERROUS SHEET

Harvie Ho Lee, Glenwood, Ill., assignor to Inland Steel Company, Chicago, Ill.

Filed Jan. 5, 1976, Ser. No. 646,530
Int. Cl.² B32B 15/18, 15/20
U.S. Cl. 428—659 6 Claims

1. A ferrous metal sheet having on a surface thereof a zinc-aluminum alloy continuous hot-dip coating which is resistant to intergranular corrosion and which has a composition consisting essentially of between 0.2 wt. % and about 17 wt. % aluminum, between about 0.06 wt. % and about 0.15 wt. % lead, and about 0.1 wt. % magnesium with the balance being essentially zinc, and said alloy coating being characterized by a smooth ripple-free surface and the absence of blistering along grain boundaries and separation of the said coating from said sheet when said ferrous metal sheet is subjected to conventional formability tests after prolonged storage in a high humidity atmosphere.

4,029,479

PLATED FOIL FOR LIQUID INTERFACE BONDING OF TITANIUM

Elmo G. Parker, La Mesa, Calif., assignor to Rohr Industries, Inc., Chula Vista, Calif.

Division of Ser. No. 327,341, Jan. 29, 1973, Pat. No. 3,981,429, which is a continuation of Ser. No. 81,262, Oct. 16, 1970, abandoned. This application June 1, 1976, Ser. No. 691,663
Int. Cl.² B32B 15/20
U.S. Cl. 428—660 2 Claims

2. A liquid interface diffusion bonded structure comprising two titanium base members diffusion bonded and joined together with a titanium base layer having, on each side thereof successive plating layers of Cu-Ag-Ni plated thereon in the order named, therebetween, the region of the bonded joint between each said member and said layer comprising grain growth on the titanium across the joint and diffusion and dilution within and throughout said region of traces of liquid interface diffusion bridge materials comprising copper, silver and nickel, said bridge materials adding of the order of 6 grams per square foot per interface of the bonded structure.

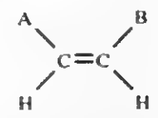
4,029,480

HYDROCARBON FUEL COMPOSITIONS CONTAINING POLYSULFONE ANTISTATIC ADDITIVES

Thomas E. Johnston, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 268,048, June 30, 1972, abandoned. This application Aug. 5, 1975, Ser. No. 602,092
Int. Cl.² C10L 1/24
U.S. Cl. 44—62 5 Claims

1. An electrically conductive hydrocarbon fuel composition comprising a normally liquid hydrocarbon fuel, and from 0.01 to 40 ppm of polysulfone copolymer, at an average molecular weight from about 10,000 to 900,000 effective to impart an antistatic property to said fuel consisting essentially of
a. about 50 mol percent of units derived from sulfur dioxide,
b. from about 40 to 50 mol percent of units derived from at least one 1-alkene having from 6 to 24 carbon atoms, and
c. from 0 to about 10 mol percent of units derived from an olefin having the formula



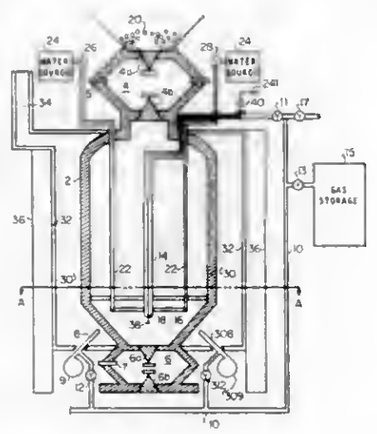
wherein A is a group having the formula, $-(C_xH_{2x})-COOH$, where x is from 0 to 17, and B is hydrogen or carboxyl, with the proviso that when B is carboxyl, x is 0, and A and B together can be a dicarboxylic anhydride group.

4,029,481

SELF POWERED BLUE WATER GAS GENERATOR

Stuart M. Oliver, Los Angeles, and Sanford J. Parsons, Richmond, both of Calif., assignors to Q² Corporation, Saratoga, Calif.

Filed Mar. 3, 1975, Ser. No. 554,761
Int. Cl.² C10J 3/20
U.S. Cl. 48—111 6 Claims



1. A blue water gas generator comprising:
a sealed retort forming a vertical column and having an upper cylindrical portion and a lower inverse conically shaped portion, the upper and lower portions being separated by a grate which is thermally coupled to the retort and disposed within the retort in a substantially horizontal plane;
means coupled to the sealed retort for applying steam within the lower portion of the sealed retort;
burner means thermally coupled to the sealed retort and disposed outside of the sealed retort and below the grate for heating under reflux materials placed within the sealed retort and establishing a substantially vertical thermal gradient therein, the gradient having a higher

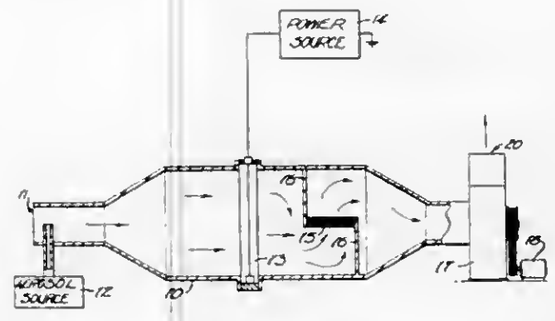
temperature potential at the lower portion of the retort than at the upper portion;
an input air lock coupled to the upper portion of the retort and operatively disposed above the grate to receive carbonaceous materials and pass them onto the grate;
an output air lock coupled to the lower portion of the sealed retort and operatively disposed below the grate to receive material which passes through the grate; and
gas extraction means coupled to the retort and communicating with the lower portion of the retort for receiving gas produced in the retort and being coupled to the burner means to burn a portion of the gas product.

4,029,482

ELECTROSTATIC REMOVAL OF AIRBORNE PARTICULATES EMPLOYING FIBER BEDS

Arlin Keith Postma, Benton City, and W. Kevin Winegardner, Richland, both of Wash., assignors to Battelle Memorial Institute, Richland, Wash.

Continuation of Ser. No. 453,714, March 27, 1974, abandoned. This application June 30, 1975, Ser. No. 591,278
Int. Cl.² B03C 3/00
U.S. Cl. 55—2 6 Claims



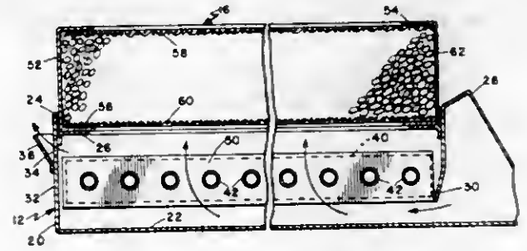
1. A method of removing an aerosol from a confined moving gaseous stream, the aerosol being composed of electrically resistive particles capable of accepting and retaining an electrical charge; said method comprising the following steps:
passing the confined gaseous stream through a corona discharge;
subsequently directing the confined gaseous stream through a dry porous bed having:
a. a physical location spaced downstream from the corona discharge;
b. substantial bed thickness in the direction of movement of the gaseous stream from an upstream location where the gaseous stream enters the bed to a downstream location where it leaves the bed;
c. relatively high porosity so as not to impede the flow of gas;
e. a structure composed of electrically resistive material;
the passage of the gaseous stream through the corona discharge and bed resulting in the production of a self-induced space charge field originating from the charged particles on the bed;
introducing the aerosol into the moving gaseous stream at a location upstream of the corona discharge whereby each particle in the aerosol is electrically charged by the emission of the corona discharge as the gaseous stream passes therethrough, the charge on each particle being a near-saturation charge of the same polarity as the space charge on the bed material;
and collecting the charged aerosol particles by deposition within the physical boundaries of the bed due to the electrical forces that result from the interaction of the charged particles and the space charge field during passage of the gaseous stream through the porous bed.

4,029,483

DIVING BELL HEATER AND ABSORBENT SYSTEM

Richard William Long, 760 Wakefield Court, San Diego, Calif. 92020

Filed May 5, 1975, Ser. No. 575,050
Int. Cl.² B01D 19/00
U.S. Cl. 55—68 9 Claims



9. The method of heating and removing carbon dioxide from breathing gas such as air that is introduced into a diving bell or that is circulated in a diving bell, comprising the steps of:
positioning a housing within the diving bell,
moving air by a blower from the bottom part of the housing out an opening in the top of the housing,
heating the moving air in the bottom part of the housing by a hot water heat exchanger,
removing carbon dioxide from the air by means of a carbon dioxide absorbent material positioned in the upper part of the housing,
feeding hot water to the heat exchanger from a source external to the diving bell,
venting of a portion of the heated air from the bottom part of the housing while passing the remaining portion of the heated air through the upper portion of the housing so that all the air passing through the bottom part of the housing does not have to pass through the carbon dioxide absorbent material if the material becomes clogged,
and selectively removing the upper part of the housing containing the carbon dioxide absorbent material to replace the absorbent material in the housing.

4,029,484

MIST SCRUBBING OF WASTE HALIDE EFFLUENT

Timothy Allen Fitzpatrick, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Jan. 21, 1976, Ser. No. 651,194
Int. Cl.² B01D 53/00
U.S. Cl. 55—71 10 Claims

1. In a process of treating a mixture of halide vapors to remove the vaporous halides of titanium, aluminum, vanadium, silicon, tin, magnesium, zinc, antimony, sulfur, phosphorus, and ammonium and separating said vaporous halides from acid halides in a waste gas stream followed by the waste gas stream the scrubbing of the improvement comprising the removal of said vaporous halides without the formation of particulates from said vaporous halides during separation by
A. generating an absorptive aqueous mist containing water in which is dissolved HCl, HNO_3, HBr, HF, HI, or one or more halide salts of calcium, sodium, ammonia, lithium, barium, and iron;
B. maintaining the temperature of the combined waste gas streams and aqueous mist at a temperature of from −5° C. to 70° C.;
C. maintaining the water vapor pressure of the absorptive aqueous mist at a vapor pressure of from 0.05–5.0 mm Hg prior to contact with the waste gas stream;
D. controlling the particle size of the aqueous absorptive mist so that the ratio of the surface area of the absorptive aqueous mist to the weight of the waste halide to be removed is at least 2 square meters surface area of the absorptive aqueous mist per gram of waste halide present in the gas stream;
E. contacting the gas stream containing the vaporous halide

with the absorptive aqueous mist to absorb said vaporous halide; and

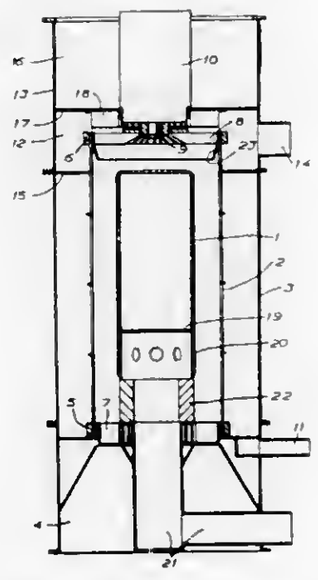
F. separating the gas stream from the aqueous absorptive mist.

4,029,485

GAS CLEANERS

Olle Lennart Siwersson, and Karl Gunnar Tell, both of Helsingborg, Sweden, assignors to AB S.T. Miljoteknik, Helsingborg, Sweden

Filed Aug. 8, 1975, Ser. No. 603,090
Int. Cl.² B03C 03/10
U.S. Cl. 55—113 5 Claims



1. In a gas cleaning apparatus of the electric precipitator type having

a gas inlet;

a gas outlet;

a plurality of discharge and collecting electrodes,

said discharge electrodes being mounted stationary in the shape of an inner cylinder surface configuration, being insulated from said collecting electrodes and being separated therefrom to form a gap therebetween, said collecting electrodes being mounted in the shape of an outer concentrical cylinder surface configuration, concentric with said discharge electrodes, for rotation around said discharge electrodes,

voltage source means to apply a voltage to said discharge and collecting electrodes, and

said gap between said cylinder surface configurations being annular and connecting at opposite ends with said gas inlet and said gas outlet;

means for forcing a gas stream to be cleaned from particles suspended therein from said gas inlet through said annular gap between said discharge and collecting electrodes to said gas outlet;

means for rapidly rotating said collecting electrodes; and a casing with extensions to the outer side of said collecting electrodes for defining an outwardly closed space,

whereby a radially directed electric field is established between said discharge and collecting electrodes when a voltage is applied by said voltage source,

said particles in said gas stream are attracted by said collecting electrodes for deposition thereon, and particles deposited on said collecting electrodes have kinetic energy imparted to them such that they are thrown out into said space between said collecting electrodes and said casing by centrifugal force;

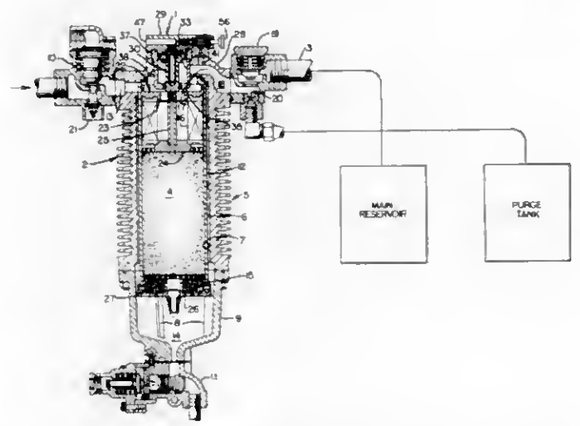
the improvement wherein means are provided between said gas outlet and said annular gap between said discharge and collecting electrodes for leading off radially outwards a peripheral portion of the gas stream leaving said annular gap between said discharge and collecting electrodes, and a separate gas outlet communicating with said annular gap and said means for leading off the peripheral portion of the gas stream for carrying away said led off portion of the gas stream.

4,029,486

PNEUMATIC COMPACTOR FOR PARTICULATE DESICCANT

Lanier Frantz, Salem, Va., assignor to Graham-White Sales Corporation, Salem, Va.

Filed Feb. 25, 1976, Ser. No. 661,307
Int. Cl.² B01D 53/26
U.S. Cl. 55—218 10 Claims



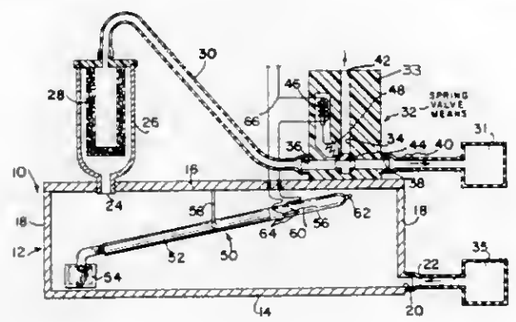
1. In a compressed gas filter assembly, the combination, with a filter unit having a housing containing a particulate desiccant for adsorbing a contaminant from compressed gas passing therethrough during a filtering cycle of the unit, of a pneumatic compactor comprising piston means actuated by compressed gas for applying a compacting force to the desiccant, and valve means normally preventing release of actuating gas from said piston means during a draining cycle of said unit.

4,029,487

APPARATUS FOR PROTECTING VACUUM SOURCES INCLUDING VALVE WHICH ALTERNATELY COMMUNICATES WITH VACUUM AND ATMOSPHERE

J. Wayne Brandt, Lutherville, Md., assignor to Spectroderm, Inc., Fairfax, Va.

Filed May 12, 1975, Ser. No. 576,477
Int. Cl. B01d 46/42
U.S. Cl. 55—309 5 Claims



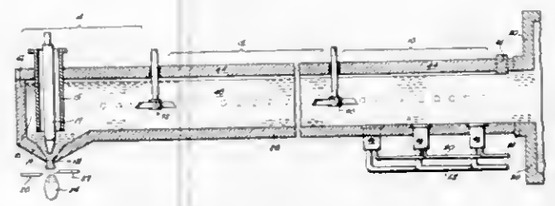
1. An apparatus for protecting vacuum sources from contamination occasioned by inadvertent aspiration of liquid-borne matter or aerosols from a device operated by a vacuum source comprising, an enclosed reservoir vessel with an inlet in the bottom thereof, a vacuum operated device in communication with said inlet, said vessel having an outlet in the top thereof, a filter housing secured to said outlet and forming an inlet to said housing, an outlet in said housing, filter means disposed between the housing inlet and outlet to filter air passed therethrough, a vacuum source, conduit means connecting said source with said filter housing outlet, a two-way valve disposed in said conduit means for communication with said vacuum source or the atmosphere, and a fulcrum disposed in said reservoir vessel and an elongated switch member connected to said fulcrum in said reservoir vessel and balanced thereby so its opposite ends are vertically movable in a see-saw manner and operatively connected to said two-way valve to communicate it to the atmosphere when the liquid level in said vessel reached a predetermined level, and biasing means normally urging said valve in a closed position and in communication with said vacuum source.

4,029,488

METHOD OF ADJUSTING GLASS TEMPERATURE IN A FOREHEARTH

Chester K. Rhett, Seattle, Wash., assignor to C. Rhett, Inc., Tukwila, Wash.

Filed Aug. 2, 1976, Ser. No. 711,068
Int. Cl.² C03B 5/02
U.S. Cl. 65—136 3 Claims



1. The method of delivering molten glass at a predetermined gob temperature from a melting furnace to an orificed forehearth bowl, comprising:

1. in the forehearth in close proximity to the entry of molten glass from said furnace, abruptly reducing the temperature of a lower central portion of the glass stream to a temperature approximately equal to but above the predetermined gob temperature;

2. immediately following the temperature reduction, mechanically blending and homogenizing the glass as it moves downstream;

3. continually applying a mild Joule-effect, below-surface conditioning heat to said stream for a period of time at least twice the length of time said stream was subjected to abrupt temperature reduction and permitting downward temperature adjustment to substantially the predetermined gob withdrawal temperature accompanied by temperature normalization throughout the stream; and

4. discharging the glass through the orifice of said bowl in the form of a series of uniform gobs.

4,029,489

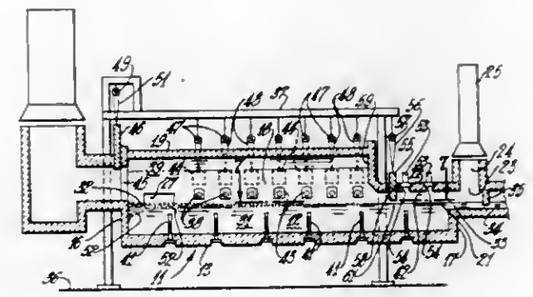
METHOD OF AND APPARATUS FOR MELTING OF GLASS

Magnus L. Froberg, Granville, and Charles M. Hohman, Newark, both of Ohio, assignors to Owens-Corning Fiberglas Corporation, Toledo, Ohio

Filed Feb. 17, 1976, Ser. No. 658,643
Int. Cl.² C03B 5/02, 5/04
U.S. Cl. 65—136 40 Claims

1. Apparatus for the melting and fining of glass comprising a receptacle for containing glass constituents including molten glass up to a glass line and glass batch above portions of said glass line; a first region in said receptacle adapted to receive glass batch; a second region in said receptacle spaced horizontally from said first region and adapted to have molten glass withdrawn therefrom; a heat source beneath the glass line in said first and second regions adapted to heat the glass; means for distributing glass batch as a blanket over a preponderance of the upper surface of said first region; a heat source beneath the glass line adapted to heat the glass; and a cover for said receptacle to enclose the space above said second region, said cover having a flue for the passage of gas from beneath said cover and said cover being positioned sufficiently close to said glass line so as to reflect heat from within the glass in said second region back to the exposed upper surface of the glass in said second region to increase the fluidity of said surface to an extent to facilitate the escape of gas from said surface in said second region while thermal conditions at the exposed surface of said first region maintain a batch blanket over a preponderance of the upper surface of said first region.

23. The method of operating a continuous glass melting and refining furnace which comprises the steps of applying a preponderance of the heat applied to a body of molten glass beneath the upper surface of that glass; applying glass batch to the mass of glass constituents including the body of molten



glass in a charging region remote from a withdrawal region and from a level above the molten glass; distributing glass batch over a substantial portion of the upper surface of the body of molten glass; withdrawing molten glass from the body of molten glass in the withdrawal region adjacent one side of the body; maintaining a heat reflective surface in close proximity above the mass of glass constituents in the withdrawal region to reflect heat to the surface of the mass of glass constituents in thre withdrawal region beneath the heat reflective surface to an extent to maintain the upper surface of the mass of glass constituents beneath the heat reflective surface sufficiently fluid to promote the escape of gas therefrom, to maintain the upper surface essentially free of batch, and to define a leading edge of the batch blanket at its interface with an upper surface of the molten glass generally along the edge of the withdrawal region most proximate said charging region.

METHOD OF TOBACCO SUCKER INHIBITION

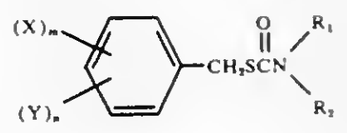
Kanichi Fujikawa; Ryohei Takahashi; Isao Yokomichi; Fumio Kimura; Takeo Kaji, and Nobuyuki Sakashita, all of Kusatsu, Japan, assignors to Ishihara Sangyo Kaisha Ltd., Osaka, Japan

Division of Ser. No. 508,732, Sept. 24, 1974, abandoned, which is a division of Ser. No. 340,534, March 12, 1973, Pat. No. 3,883,343. This application Aug. 4, 1975, Ser. No. 601,827

Claims priority, application Japan, Mar. 13, 1972, 47-26016

Int. Cl.² A01N 9/12
U.S. Cl. 71—78 4 Claims

1. A plant growth inhibiting composition which comprises the combination of a benzylthiolcarbamate having the formula



wherein

R_1 and R_2 are selected from the group consisting of acetyl, cyclohexyl, and C_{1-6} alkyl groups,

X and Y are selected from the group consisting of nitro, acetyl, amino, C_{1-3} alkyl, C_{1-3} alkoxyl and halogen; and

m and *n* are 0 or 1 with an alkyl-N-phenylcarbamate, wherein the phenyl ring is unsubstituted or substituted with a lower alkyl group or a halogen atom; and

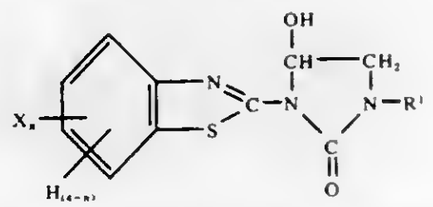
wherein said carbamate is mixed with said benzylthiolcarbamate in a ratio of from 0.1 to 6:1.

4,029,491
1-BENZOTHIAZOLYL-5-HYDROXYIMIDAZOLIDINONES

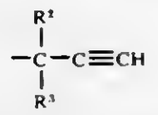
John Krenzer, Oak Park, and Chin Ching Wu, Libertyville, both of Ill., assignors to Velsicol Chemical Corporation, Chicago, Ill.

Filed Apr. 29, 1976, Ser. No. 681,372
Int. Cl.² A01N 9/12; C07D 277/82
U.S. Cl. 71—90 **10 Claims**

1. A compound of the formula



wherein X is selected from the group consisting of lower alkyl, chlorine, bromine, fluorine, lower chloroalkyl, lower bromoalkyl, trifluoromethyl, and lower alkoxy; *n* is an integer from 0 to 2; and R^1 is selected from the group consisting of lower alkyl, lower alkenyl, lower haloalkyl and



wherein R^2 and R^3 are each selected from the group consisting of hydrogen and alkyl of up to 3 carbon atoms.

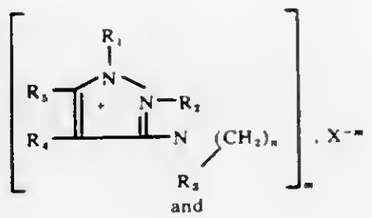
10. A method of controlling weeds which comprises contacting said weeds with a herbicidal composition comprising an inert carrier and, as an essential active ingredient, in a quantity toxic to weeds, a compound of claim 1.

4,029,492
NOVEL 1,2-DIALKYLPYRAZOLIUM COMPOUNDS HAVING 3-(OR 3,5-) NITROGEN-CONTAINING HETEROCYCLIC GROUP AS HERBICIDES

Barrington Cross, Rocky Hill, and Bryant Leonidas Walworth, Pennington, both of N.J., assignors to American Cyanamid Company, Stamford, Conn.

Filed May 5, 1975, Ser. No. 574,795
Int. Cl.² A01N 9/22
U.S. Cl. 71—92 **10 Claims**

1. A method for the postemergence control of undesirable plant species comprising the step of: applying to the foliage of said undesirable plant species a herbicidally effective amount of a compound having a formula selected from the group consisting of:

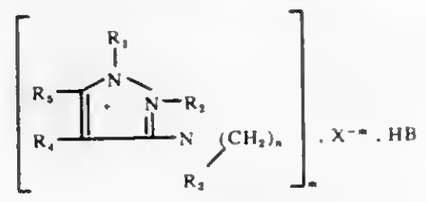


(I)

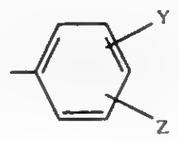
and

-continued

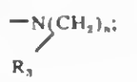
(II)



wherein R_1 and R_2 each represents alkyl C_1–C_4; R_3 represents a member selected from the group consisting of hydrogen, alkyl (C_1–C_3), alkoxy (C_1–C_3), phenyl, benzyl, cyano, carboxamido and carboxy; R_4 represents a member selected from the group consisting of hydrogen, alkoxy (C_1–C_4) and halogen; R_5 represents a member selected from the group consisting of



cyclohexyl and



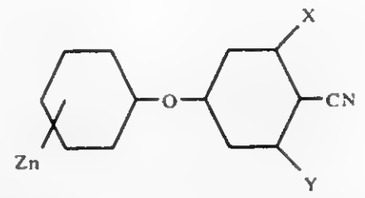
Y and Z each independently represents a member selected from the group consisting of hydrogen, halogen, methyl and alkoxy (C_1–C_4); X represents a non-phytotoxic anion with a charge of 1 to 3; *n* represents an integer from 4 to 6; and *m* represents an integer from 1 to 3; and HB is an inorganic acid.

4,029,493
SUBSTITUTED PHENOXYBENZONITRILES AS HERBICIDES

Robert James Theissen, Union County, N.J., assignor to Mobil Oil Corporation, New York, N.Y.

Division of Ser. No. 335,408, Feb. 23, 1973, Pat. No. 3,923,858, which is a continuation-in-part of Ser. No. 69,959, Sept. 4, 1970, abandoned. This application May 21, 1975, Ser. No. 579,520
Int. Cl.² A01N 9/20
U.S. Cl. 71—105 **5 Claims**

1. The method for combatting herbs that comprises contacting them pre-emergently with an herbicidally effective amount of a compound having the formula:



wherein X is hydrogen, Y is halogen or lower alkyl, Z is halogen and *n* is an integer of from 1 to 3.

4,029,494
PROCESS FOR SMELTING AND RECOVERY OF A MATERIAL CONTAINING NOBLE METALS

Aarne Albin Kapanen; Raimo Uolevi Rantanen; Leo Elias Lindroos; John Henrik Relander, and Risto Johannes Honkala, all of Pori, Finland, assignors to Outokumpu Oy, Helsinki, Finland

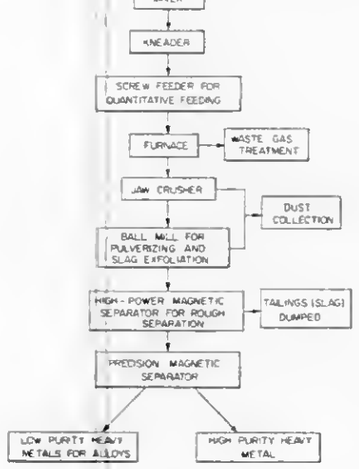
Filed Aug. 19, 1974, Ser. No. 498,321
Claims priority, application Finland, Aug. 24, 1973, 2655/73
Int. Cl.² C22D 7/00
U.S. Cl. 75—10 R **4 Claims**

1. A process for smelting of anode slime containing at least one of the noble metals gold and silver produced in the electrolytic copper process in order to recover the noble metals, comprising mixing slag-forming materials with the anode slime; smelting the mixture in a first inductively heated zone to produce a metal phase and a slag phase; at least partly withdrawing the slag phase from the first inductively heated zone and transferring the metal phase from the first inductively heated zone to a second inductively heated zone operating at a lower frequency than the first inductively heated zone and oxidizing the metal phase in said second treatment zone to form a refined product containing said noble metals.

4,029,495
PROCESS FOR RECOVERING A HEAVY METAL CATALYST COMPONENT FROM A SPENT CATALYST

Yoshiro Hirayama, 3-10, Chihaya-cho, Toshima, Tokyo, Japan

Filed Aug. 3, 1976, Ser. No. 711,223
Claims priority, application Japan, May 2, 1976, 51-12035; Mar. 2, 1976, 51-22464
Int. Cl.² C22D 7/00
U.S. Cl. 75—10 R **20 Claims**



1. A process for recovering a catalytic component which is a heavy metal or compound thereof from a spent supported catalyst composed of the catalyst metal and a non-combustible inorganic support, said process comprising the steps of:

a. introducing the waste supported catalyst into a furnace;

b. heating the waste catalyst within the furnace to at least 1,000° C to transform the waste catalyst into a sintered or semi-melted mass;

c. agitating said sintered or semi-melted catalyst mass to cause the metal component to aggregate as discrete granules within the sintered mass and to break the sintered mass into a granular material;

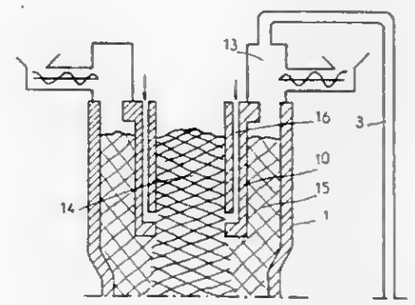
d. crushing said granular material; and

e. separating the metal granules from the crushed material.

4,029,496
PROCESS FOR THE REDUCTION OF IRON MINERAL

Ernest Dubois, Lausanne, Sweden, assignor to Etudes et Recherches Industrielles et Metallurgiques - ERIM, Lausanne, Switzerland

Continuation-in-part of Ser. No. 403,838, Oct. 5, 1973, abandoned. This application June 30, 1975, Ser. No. 592,089
Int. Cl.² C21B 13/02
U.S. Cl. 75—35 **8 Claims**



1. A substantially continuous process for the reduction of iron minerals in solid state in a vertical furnace comprising (1) charging the furnace substantially continuously with a mixture of particles of iron minerals and particles of solid carbonaceous combustible fuel containing large quantities of volatile hydrocarbons such that the mixture descends from top to bottom of the furnace by gravity, (2) injecting oxygen into the medial zone of the furnace as a plurality of fine jets distributed over the periphery of the furnace and over all of the height of the medial zone such that the oxygen ascends to the top of the furnace countercurrently to the mixture of solid particles, (3) withdrawing gases containing volatile components extracted from the mixture of particles produced at the top of the furnace, (4) washing and detarring the withdrawn gases and recycling the gases to the bottom of the furnace such that the gases ascend countercurrently to the mixture of solid particles, (5) withdrawing solids containing reduced iron and coke from the bottom of the furnace, wherein:

a. an upper zone is maintained in the furnace for heating the descending mixture of solid particles and cooling the ascending gases by countercurrent heat exchange,

b. a medial zone is maintained in the furnace for heating and reducing the iron minerals,

c. a lower zone is maintained in the furnace for heating the recycled gases and cooling the mixture of solids by countercurrent heat exchange,

d. the oxygen is injected into the medial zone at a low velocity compared to the velocity of the ascending gases,

e. the medial zone is heated by the combustion of at least a part of the ascending recycled gases and injected oxygen,

f. the amount of oxygen injected into the medial zone is regulated to maintain a temperature therein between 950° C. and 1200° C.,

g. the amount of gases recycled to the bottom of the furnace is regulated whereby the upper and lower zones are in heat exchange equilibrium and the calorific mass of the gases is substantially equal to the calorific mass of the solids in each zone,

h. the gases withdrawn at the top of the furnace are at a temperature of less than 100° C., and

i. the solids withdrawn from the bottom of the furnace are at a temperature of less than 100° C.

4,029,497

MANUFACTURE OF ALLOY STEELS AND FERROUS ALLOYS

Ivor Gray Nixon, Ier Stock Ost, "Matterhorgruss", Zermatt 3920, Valais, Switzerland

Filed Feb. 21, 1975, Ser. No. 551,738
Claims priority, application United Kingdom, Feb. 26, 1974, 8576/74
Int. Cl.² C21C 7/00
U.S. Cl. 75—60 40 Claims

1. A method for the production of a ferrous alloy in a converter comprising the steps of:

i. charging to said converter a metallic feedstock selected from the group consisting of steel, scrap, iron sponge and high grade cast iron, and mixtures thereof, containing minor amounts of non-ferrous elements, together with a ferro-alloy to provide a pool of molten metal in said converter;

ii. refining said molten metal by blowing with a decarburizing feed gas which is reducing to wustite at the temperature at which said converter is operated and which comprises a mixture of gases selected from the group consisting of mixtures comprising carbon monoxide, carbon dioxide, hydrogen and water vapor and gas mixtures which generate carbon monoxide, carbon dioxide, hydrogen and water vapor in situ in said converter; and

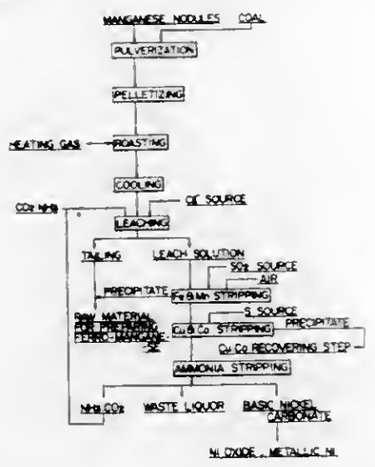
iii. tapping ferrous alloy and slag from said converter.

4,029,498

PROCESS FOR TREATING MANGANESE NODULES

Yasuhiro Okajima, Ichikawa, Japan, assignor to Sumitomo Metal Mining Co., Limited, Tokyo, Japan

Filed May 8, 1975, Ser. No. 575,700
Claims priority, application Japan, May 23, 1974, 49-57278
Int. Cl.² C22B 47/00
U.S. Cl. 75—103 14 Claims



1. In a process for recovering the metal impurities contained in manganese nodules which contain nickel, copper, cobalt, iron and manganese compounds which includes the steps of:

1. reducing the manganese nodules so as to convert the nickel, copper and cobalt to their metallic states while inhibiting the conversion of iron and manganese into their metallic state, thereby producing a reduced ore;
2. slurrying said reduced ore in a liquid selected from the group consisting of water or an aqueous ammoniacal solution;
3. adding said slurry to an aqueous ammoniacal solution and then blowing air into said solution;
4. adding a water-soluble chloride to said solution of (3) to form a leach solution, said compound being used in an amount of less than 3% by weight of the reduced ore; the improvement wherein after step (4) the following steps are conducted:
5. adding an SO_2-containing compound to said leach solution in order to help remove the manganese and iron impurities;
6. blowing air into said leach solution: and
7. removing the iron and manganese precipitates from said leach solution of step (6) in order to recover a solid useful for the preparation of ferromanganese.

4,029,499

RECOVERY OF GALLIUM

Walter Westwood; Jnhn James MacGregor, and John Blunden Payne, all of London, England, assignors to Johnson Matthey & Co., Limited, London, England

Filed July 3, 1975, Ser. No. 592,863
Claims priority, application United Kingdom, July 10, 1974, 30490/74
Int. Cl.² C22B 58/00
U.S. Cl. 75—109 7 Claims

1. A process for the recovery of gallium and alumina from bauxite ore comprising the steps of:

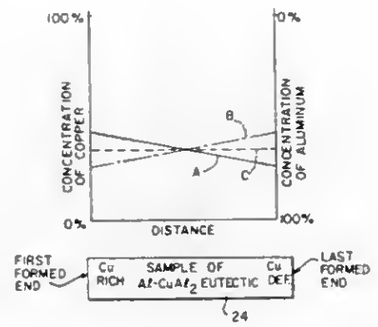
a. dissolving the ore in caustic soda solution under pressure;
b. precipitating alumina from the remaining caustic soda solution by reduction of temperature and pressure;
c. subjecting the resulting mother liquor from (b) to an elevated temperature of 60° to 450° C and a pressure of 2 to 100 atmos. in the presence of an oxygen-containing atmosphere; and
d. cementation of the gallium remaining in solution by contact with metallic aluminium.

4,029,500

METHOD OF GROWING COMPOSITES OF THE TYPE EXHIBITING THE SORET EFFECT

James C. Fletcher, Administrator of the National Aeronautics and Space Administration, with respect to an invention of, and Biliyar N. Bhat, Grilfith, Ind.

Filed Mar. 11, 1975, Ser. No. 557,565
Int. Cl.² C22C 1/09
U.S. Cl. 75—135 9 Claims



1. A method for reducing lengthwise constituent concentration variations in a composite of the type exhibiting the Soret effect comprising:

a. introducing into a molten sample of the composite a predetermined lengthwise variation in the concentration of the constituents of the composite so that the concentration of that constituents which migrates toward the cooler part of a liquid solution of the composite held in a temperature gradient, varies from a higher value at one end of the sample to a lower value at the other end; and
b. directionally solidifying the molten sample starting at said other end for introducing into the composite a lengthwise constitutent concentration variation that is opposite to the variation present in the composite prior to solidification.

4,029,501

METHOD OF PREPARING IMPROVED MAGNETIC HEAD MATERIAL

Herbert Irwin Moss, Yardley, Pa., assignor to RCA Corporation, New York, N.Y.

Filed Jan. 26, 1976, Ser. No. 652,225
Int. Cl.² B22F 3/14
U.S. Cl. 75—206 8 Claims

1. A method of oxidizing magnetic transducer head material having a first phase of a magnetic alloy or iron, silicon and aluminum and a hard, abrasion-resistant second phase at the grain boundaries of said first phase comprising

forming a thin oxide layer encapsulating finely-divided particles of an alloy of iron, silicon and aluminum in a hot aqueous base solution containing an oxidizing amount of alkali metal chlorate,

collecting the oxidized particles, and

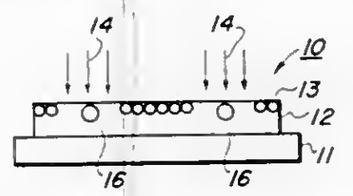
hot pressing the particles to form a substantially theoretically dense, compacted body from said oxidized particles, said body containing from about 2000 up to about 7500 parts per million of oxygen.

4,029,502

IMAGING SYSTEM CONTAINING AGGLOMERABLE MATERIAL

William L. Goffe, Webster, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Aug. 26, 1968, Ser. No. 755,306
Int. Cl.² G03G 13/22
U.S. Cl. 96—1 PS 33 Claims



1. An imaging method comprising the steps of:

a. providing an imaging member comprising a non-gaseous agglomerable layer contacting a softenable layer, said softenable layer or said agglomerable layer capable of being softened pursuant to the imagewise softening step below; and
b. imagewise softening said softenable layer or said agglomerable layer or both to cause agglomeration of nongaseous portions of said agglomerable layer in said imagewise softened areas of said member whereby said member in said imagewise softened areas is made more transparent compared to non-imagewise softened areas of said member.

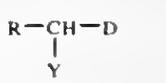
4,029,503

DIFFUSIBLE-DYE RELEASING TYPE DYES WHICH COUPLE TO FORM COLORLESS PRODUCTS

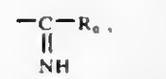
Mitsuto Fujiwhara, and Ryosuke Sato, both of Hino, Japan, assignors to Konishiroku Photo Industry Co., Ltd., Tokyo, Japan

Division of Ser. No. 453,862, March 22, 1974, abandoned.
This application May 7, 1975, Ser. No. 575,374
Claims priority, application Japan, Mar. 28, 1973, 48-34469
Int. Cl.² G03C 7/00, 5/54, 7/04, 5/30
U.S. Cl. 96—29 D 24 Claims

1. In a diffusion transfer process which comprises imagewise exposing a photosensitive material comprising a support and a silver halide photosensitive layer thereon containing silver halide grains and further comprising a dye image forming substance therein; developing the exposed photosensitive material in an aqueous developing solution in the presence of a color developing agent thereby to form a diffusihle dye image corresponding to the imagewise exposure and derived from the dye image forming substance; and transferring the dye image from the photosensitive material to an image receiving layer superposed on the photosensitive material at least during the development whereby the dye image corresponding to the imagewise exposure is obtained in the image receiving layer, the improvement which comprises, as the dye image forming substance, a diffusible-dye releasing type dye having the formula:



in which D represents a dye residue carrying a water-soluble radical; Y represents hydrogen, halogen, an alkyl radical, an aryl radical, a heterocyclic radical, —O—R_1 or —$COOR_3$; R_1 is an alkyl radical, an aryl radical, a heterocyclic radical, an acyl radical or —SO_2—R_2; R_2 is an alkyl, aryl or heterocyclic radical; R_3 is an alkyl radical; R represents —CO—RA_4.



—SO_2—R_5, —SO—R_5, —CN or —$N(R_6)_2$; R_4 is hydrogen, hydroxyl, —R_0, —OR_0, —$N(R_0)_2$, —NH_2 or —NHR_0; R_5 is hydrogen, —R_0, —OR_0 or —$N(R_0)_2$; R_6 is hydrogen or —R_0; and R_0 is an aliphatic, aryl or heterocyclic radical, and when two or more R_0's are present in one radical, two of said R_0's can form together a nitrogen-containing heterocyclic ring, the diffusible-dye releasing type dye per se being non-diffusible and capable of coupling with the color developing agent in the aqueous developing solution in the presence of the exposed silver halide to split off D in the formula whereby the dye image is produced from D so split off, and the compound produced upon splitting off D being substantially colorless.

4,029,504

PHOTOGRAPHIC IMAGE TRANSFER ELEMENTS CONTAINING NEUTRALIZING LAYERS COMPRISING PARTICULATE MATERIALS

George Richard Secrist, Webster; Richard Warren Berls, and Brooke Pershing Schlegel, both of Rochester, all of N.Y., assignors to Eastman Kodak Company, Rochester, N.Y.

Filed Apr. 14, 1976, Ser. No. 676,946
Int. Cl.² G03C 7/00, 5/54, 1/48, 1/40
U.S. Cl. 96—29 D 22 Claims

16. In a process of producing a photographic transfer image in color from an imagewise-exposed photographic element comprising a support having thereon at least one photosensitive silver halide emulsion layer having associated therewith a dye image-providing material, said process comprising treating said element with an alkaline processing composition in the presence of a silver halide developing agent to effect development of each of said exposed silver halide emulsion layers;

a. an imagewise distribution of dye image-providing material being formed as a function of development;
b. at least a portion of said imagewise distribution of dye image-providing material diffusing to a dye image-receiving layer;
c. a timing layer associated with a neutralizing layer being permeable by said alkaline processing composition after a predetermined time and wherein said layers are present in an image-receiving element or a cover sheet; and
d. said alkaline processing composition being neutralized by means of said neutralizing layer associated with said photographic element after said predetermined time;

the improvement comprising incorporating in said neutralizing layer a particulate material selected from the group consisting of diatomaceous earth, exploded volcanic rock and hydrous calcium silicate.

4,029,505

METHOD OF PRODUCING POSITIVE POLYMER IMAGES

William John Nebe, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 542,566, Jan. 20, 1975, abandoned, which is a continuation-in-part of Ser. No. 384,501, Aug. 1, 1973, abandoned. This application May 20, 1976, Ser. No. 688,479

Int. Cl.² G03C 5/00; G03C 5/04; G03C 1/68

U.S. Cl. 96—35.1 28 Claims

1. Method of making a positive polymeric image on a substrate which comprises

a. applying to the substrate a layer of photopolymerizable composition containing (1) non-gaseous ethylenically unsaturated compound capable of addition polymerization by free-radical initiated chain propagation, (2) 0.1–10% by weight, based on the photopolymerizable composition, of a compound containing a dinitroso group which is a noninhibitor of free-radical polymerization and is photochemically converted by ultraviolet radiation to an inhibitor of free-radical polymerization, and (3) 0.001–1.0 part by weight, per part of unsaturated compound, of an organic free-radical generating system activatable by actinic radiation that does not convert the dinitroso compound to an inhibitor of free-radical polymerization,

b. imagewise exposing a portion of the photopolymerizable layer through an image-bearing transparency consisting solely of substantially opaque and substantially transparent areas to ultraviolet radiation that converts the dinitroso compound to an inhibitor of free-radical polymerization, thereby inhibiting photopolymerization in the exposed areas,

c. exposing a greater portion of the photopolymerizable layer, including the areas exposed to the imagewise exposure radiation, to actinic radiation that activates the free-radical generating system but does not convert the dinitroso compound to an inhibitor of free-radical polymerization, whereby a positive polymeric image is formed in the areas not exposed to the imagewise exposure radiation.

4,029,506

UNIVERSAL PRODUCT CODE MARKING COMPOSITION CONTAINING A PHOTOSENSITIVE DYE FORMER, A PIGMENT AND A BINDER AND THE USE THEREOF

Rolf Dessauer, Greenville, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 516,483, Oct. 21, 1974, abandoned. This application Sept. 22, 1976, Ser. No. 725,585

Int. Cl.² G03C 5/24, 1/52

U.S. Cl. 96—48 R 7 Claims

1. A marking composition comprising:

a. a colorless, radiation-sensitive composition which, under exposure to radiation of the visible spectrum, is capable of forming a substantially permanent dye that can absorb at least a portion of the wavelength of light in the visible spectrum,

b. a pigment capable of diffusely reflecting the wavelengths of light absorbed by the dye, the amount of said pigment at least sufficient to opacify the marking composition but not so much as to hide color formed by exposure to radiation, and

c. a radiation-transmissive, colorless polymeric binder capable of providing coating adhesion to the surface of a substrate,

the quantity of pigment comprising about from 3 to 12 percent by volume of the combined components (a), (b) and (c) and the radiation-sensitive composition being present in an amount sufficient to produce, upon exposure to radiation of the visible spectrum, a detectable difference in diffuse reflectance density between exposed and unexposed areas.

4,029,507

PROCESS FOR THE PRODUCTION OF LIGHTFAST PHASE HOLOGRAMS UTILIZING AMMONIUM DICHROMATE AND GELATIN AS PHOTOSENSITIVE RECORDING MATERIAL

Hans Wehner, Bergisch-Gladbach, and Manfred Kliemann, Leichlingen, both of Germany, assignors to AGFA-Gevaert, A.G., Leverkusen, Germany

Filed Aug. 1, 1974, Ser. No. 493,515

Claims priority, application Germany, Aug. 4, 1973, 2339579

Int. Cl.² G03C 5/22

U.S. Cl. 96—49 7 Claims

1. A process for production of light fast phase holograms using a recording material comprised of a light-sensitive material containing hardenable gelatin

in which the recording material is

preliminarily hardened in a solution of 3–30% aqueous formaldehyde for up to 10 minutes to provide a temporary hardening and then

sensitized in a solution of from 1–10% ammonium dichromate

holographically exposed whereby cross-linked areas are created in accordance with the interference pattern of the holographic exposure and then the exposed material is developed to provide a phase hologram therein,

wherein the improvement comprises

the next treatment of the material after exposure is subjecting the hologram to a strongly basic formaldehyde sulfite bath comprising a solution of 3 to 20% hy weight of sodium sulphite ($Na_2S_2O_5$) and 5 to 30% by weight of 30% formalin in water for a period to desensitize the ammonium dichromate sensitization of the recording material

and then treating the desensitized material with a bath containing formaldehyde to harden the gelatin of the material and then

irrigating with running water for 30 minutes to 1 hour to complete desensitization by washing out dichromate without altering the cross-linked condition in the gelatin,

after which the exposed and developed material is dehydrated in a first stage with aqueous isopropanol solution and in a second stage with concentrated isopropanol solution to which formaldehyde has been added and dried,

said process producing optically clear phase holograms having signal to noise ratios of 30 to 70.

4,029,508

SILVER HALIDE MATERIAL CONTAINING A YELLOW COLOR-FORMING COUPLER

Mitsugu Tanaka; Atsuaki Arai; Kiyoshi Nakazyo, and Keisuke Shiba, all of Minami-ashigara, Japan assignors to Fuji Photo Film Co., Ltd., Minami-ashigara, Japan

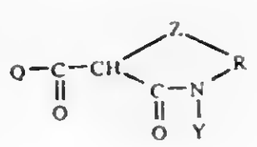
Filed Aug. 14, 1975, Ser. No. 604,861

Claims priority, application Japan, Aug. 14, 1974, 49-92894

Int. Cl.² G03C 7/00, 1/40

U.S. Cl. 96—56.3 13 Claims

13. A method of forming color photographic images which comprises developing an image-exposed photographic silver halide emulsion with a primary aromatic amine color developing agent in the presence of a yellow color forming photographic coupler as represented by the following general formula (1):



(1)

wherein Q represents a phenyl group, a naphthyl group, a pyridyl group or a furyl group, Y represents a hydrogen atom, an aliphatic group having 1 to 40 carbon atoms, an ali cyclic group, an aromatic group having 6 to 40 carbon atoms or a heterocyclic group having 3 to 40 carbon atoms, R represents a divalent aliphatic group having 1 to 40 carbon atoms, a divalent alicylic group, a divalent aromatic group having 6 to 40 carbon atoms or a divalent heterocyclic group having 3 to 40 carbon atoms; and Z represents an oxygen atom, a sulfur atom or a nitrogen atom substituted with an acyl group or a sulfonyl group.

4,029,509

POSITIVE PROCESS USING A LOW COATING WEIGHT SILVER HALIDE

Ralph Kingsley Blake, deceased, late of Union County, N.J., by June Arlene Blake, executrix, assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Nov. 17, 1975, Ser. No. 632,729

Int. Cl.² G03C 5/32, 5/24, 1/76

U.S. Cl. 96—60 R 8 Claims

1. A process of forming an image in a photosensitive element that comprises a film support, a photosensitive silver halide layer, and an underlayer containing a chemically bleachable colorant selected from the group consisting of colloidal silver, colloidal mercury, colloidal palladium, colloidal copper, a copper film, a zinc film, a lead film, and a silver film; which process comprises:

1. imagewise exposing said photosensitive silver halide layer to actinic radiation,

2 developing the resulting latent image in said silver halide layer,

3. no sooner than step (2), treating said photosensitive element with a compound capable of generating sulfide ions under the conditions of treatment said compound selected from the group consisting of thiourea, substituted thioureas, mono-or di-N- substituted thioacetamides, dialkyl substituted dithiocarbamates, and

4. immersing said photosensitive element in a chemical bleach bath so as to chemically bleach the image in the silver halide layer and to bleach those areas of the colorant-containing layer which are under the image in the silver halide layer, leaving an image in those areas of the colorant-containing layer which are directly under the unexposed nonimage areas of the silver halide layer.

MULTI-SOLUTION PHOTOGRAPHIC PROCESSING METHOD USING MULTI-COMPONENT DEVELOPER COMPOSITIONS

Daniel Earle Speers, Miami, Fla., assignor to General Film Development Corporation, Southport, Conn.

Continuation-in-part of Ser. No. 273,048, July 19, 1972, abandoned. This application Dec. 23, 1974, Ser. No. 535,785

Int. Cl.² G03C 5/30, 5/38

U.S. Cl. 96—61 R 9 Claims

2. The method of rapidly developing silver halide film of the type such as is used as dental *X*-ray film at ordinary ambient room temperature processing conditions to produce a developed film which is clinically acceptable imagewise as resulting from the exposed *X*-ray film comprising immersing the exposed *X*-ray film for no longer than approximately 30 seconds, and with only an initial 5 second agitation of the immersed film, in an aqueous developer solution at ordinary ambient room temperature processing conditions, said developer solution having a pH in the range of 10 to 11 at 23° C (73° F), said aqueous developer solution including only the following three developing agents: p-methylaminophenol sulphate, 1,4-dihydroxy-benzene and 1-phenyl-3-pyrazolidone, and including anhydrous sodium sulphite for acting as a preservative, sodium hydroxide for acting as an accelerator, potassium bromide for acting as an anti-foggant and potassium carbonate for acting as a huffer for reducing oxidation, thereby producing developed dental X-ray film which is clinically acceptable imagewise within said short time period under such convenient ambient room temperature processing conditions.

COMPOSITION FOR USE IN MANUFACTURE OF MOLDED HOLLOW RUBBER ARTICLES

Malcolm E. Carson, Cleveland, and William M. Ellslager, South Euclid, both of Ohio, assignors to Kalcor Coatings Company, Inc., Willoughby, Ohio

Filed Feb. 26, 1976, Ser. No. 661,727

Int. Cl.² B28B 7/36

U.S. Cl. 106—38.22 2 Claims

1. A composition useful as a coating for the inside of pressurebag-molded hollow rubber articles during the final molding and curing operation, consisting essentially of an aqueous dispersion of 40 to 50% (based on entire composition weight) of mica of a particle size between 160 and 325 U.S. standard mesh, 4 to 10% of an alkyl acid phosphate in which the alkyl group contains 8 to 18 carbon atoms, 5 to 10% of a volatile nonaromatic hydrocarbon petroleum distillate, and sufficient surfactant to keep the composition homogeneous, the entire composition being at a pH of 4.5 to 5.0.

4,029,512

METHOD FOR THE PREPARATION OF FIBROUS INSOLUBLE CALCIUM SULFATE ANHYDRITE

Karlis L. Jaunarajs, Denver, Colo., and Julie C. Yang, Lexington, Mass., assignors to Johns-Manville Corporation, Denver, Colo.

Continuation-in-part of Ser. No. 281,269, Aug. 16, 1972, abandoned. This application Aug. 5, 1974, Ser. No. 494,429

The portion of the term of this patent subsequent to Oct. 28, 1992, has been disclaimed.

Int. Cl.² C04B 11/00

U.S. Cl. 106—109 11 Claims

1. A process for the formation of fibrous water insoluble calcium sulfate anhydrite, the fibers thereof having an overall average length in the range of from 30 to 70 microns, individual maximum lengths not exceeding 180 microns, and aspect ratios in the range of from 10:1 to 100:1; which comprises:

a. forming an aqueous suspension of gypsum, said suspension being not greater than 0.30 molar in gypsum, and said gypsum prior to dispersion being in the form of particles at least 90% of which are minus 4 mesh in size; and

b. converting the gypsum in said suspension to said fibrous calcium sulfate hemihydrate by reaction in a pressure vessel in the presence of saturated steam at a temperature in the range of from 120° C to 155° C for a period of 0.5 to 2.5 hours, thereby forming fibers of calcium sulfate hemihydrate having the aforesaid dimensions; and

c. thereafter calcining said fibers of calcium sulfate hemihydrate at a temperature in the range of 500° C to 750° C for a period of 0.5 to 3.0 hours to convert said fibers of calcium sulfate hemihydrate to fibers of water insoluble calcium anhydrite having substantially the same crystalline shape and dimensions.

10. A reinforced composite article comprising an inorganic matrix reinforced with the fibrous water insoluble calcium sulfate anhydrite produced in accordance with the process of claim 1.

11. A reinforced composite article comprising an organic polymeric resin matrix reinforced with the fibrous water insoluble calcium sulfate anhydrite produced in accordance with the process of claim 1.

SURFACE TREATED SILICA

Eric W. Vessey, Springfield, Pa.; James R. Miller, Rancho La Costa, Calif., and Klaus Robert Lange, Huntingdon Valley, Pa., assignors to Philadelphia Quartz Company, Valley Forge, Pa.

Continuation-in-part of Ser. No. 376,269, July 3, 1973, abandoned. This application June 11, 1975, Ser. No. 585,910
Int. Cl.² C09C *1/28*
U.S. Cl. 106—288 B **11 Claims**

1. A process for preparing microfine hydrated precipitated silica with a surface layer containing polyvalent inorganic ions by protocoacervate without residual gel formation, comprising:
a. forming a protocoacervate solution by saturating a dilute sodium silicate solution with a salt of a polyvalent inorganic ion;
b. neutralizing said protocoacervate solution to a pH of 8 to 9.5 by the slow addition of an acid of a polyvalent anion saturated with the salt of a polyvalent inorganic ion, thereby precipitating silica;
c. filtering, washing and reslurrying the precipitated silica;
d. adjusting the pH of the reslurried silica to about 9;
e. boiling the reslurried silica;
f. acidifying the slurry to a pH below about 3;
g. raising the pH of the slurry to between 6 and 7 with ammonia;
h. filtering, washing and reslurrying the precipitated silica; and
i. drying said slurry to obtain the product.

4,029,514
METHOD OF PRECIPITATING MICROFINE SILICA USING PHOSPHATE

Klaus Robert Lange, Huntingdon Valley, Pa., assignor to Philadelphia Quartz Company, Valley Forge, Pa.

Continuation-in-part of Ser. No. 376,269, July 3, 1973, abandoned. This application June 9, 1975, Ser. No. 584,804
Int. Cl.² C09C *1/28*
U.S. Cl. 106—288 B **6 Claims**

1. A method of precipitating finely divided silica having an ultimate particle size between 20 and 800 mμ, loss on ignition between 6.5 and 10.5%, loss at 105° C between 3.0 and 5.0%, pH value of 6.5 to 10, void volume of 1.3 to 5.0 cc/g., surface area of 25 to 600 m^2/g and pore volume of 0.01 to 0.4 cc/g. and having phosphate ions on the surface of said silica, said method comprising the steps of:
a. forming a dilute solution of sodium silicate having a weight ratio of 1.5 to 4.0 SiO_2/1.0 Na_2O and containing 0.01 to 0.05 g. of Na_2O/cc;
b. heating the dilute silicate solution to a temperature between 80° and 100 ° C;
c. adding 0.7 to 1.2 equivalents of phosphate salt per equivalent of Na_2O to said heated solution while maintaining the temperature between 80° and 100° C for a period of 1.0 to 3.5 hours, thereby producing a slurry of silica;
d. filtering, washing and reslurrying the silica with aqueous NH_3, and
e. filtering, rewashing and drying to obtain the product.

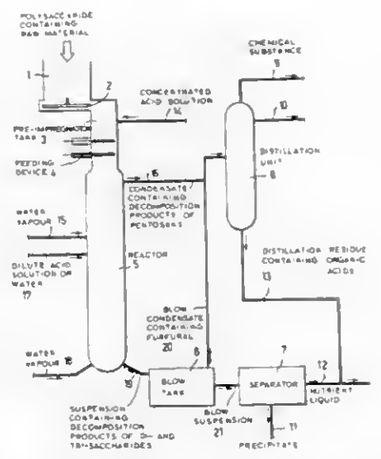
ACID HYDROLYSIS OF POLYSACCHARIDE-CONTAINING RAW MATERIAL

Keijo Kiminki; Raili Kulmala, and Seppo Sipilä, all of Pori, Finland, assignors to Oy. W. Rosenlew Ab, Pori, Finland

Filed Sept. 19, 1975, Ser. No. 615,037
Claims priority, application Finland, Oct. 4, 1974, 742911
Int. Cl.² C13K *1/02, 13/00*
U.S. Cl. 127—37 **7 Claims**

1. A continuous method for the decomposition of a raw material containing polysaccharides under pressure and elevated temperature by means of acid hydrolysis into raw materials of chemical and microbiological industry, as well as for recovery of same, said method comprising hydrolyzing the raw material containing polysaccharides continuously in one reactor as two steps, in the first step the hydrolysis being carried out in the upper part of the reactor in a vapor phase, and in the second step the hydrolysis being carried out in the bottom part of the reactor in a liquid phase, said steps being performed by:
a. impregnating the raw-material with a concentrated acid and supplying the impregnated raw-material into the reactor,
b. supplying water vapor into the bottom part of the vapor phase, and by the effect of the concentrated acid and water vapor decomposing pentosans into furfural, acetic acid, methanol, and acetone, and decomposing hexosans into disaccharides and trisaccharides,



c. from the upper part of the vapor phase removing a condensate containing the mentioned decomposition products of pentosan,
d. feeding a dilute acid solution into the upper part of the liquid phase and feeding water vapor into the bottom part of the liquid phase, and by the effect of the dilute acid and water vapor decomposing the disaccharides and trisaccharides obtained in the first step into monosaccharides and into saccharic and fatty acids, and
e. removing from the liquid phase a liquid containing the mentioned decomposition products of disaccharides and trisaccharides.

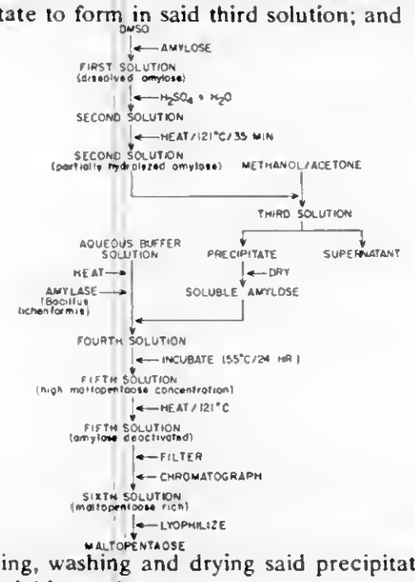
PROCESS FOR PRODUCING SOLUBLE AMYLOSE

Thomas John Pankratz, Newark, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Apr. 9, 1976, Ser. No. 675,650
Int. Cl.² C08B *33/02*; **C13L** *1/08, 1/12*
U.S. Cl. 127—38 **6 Claims**

1. A process for producing water-soluble amylose comprising the steps of:
a. dissolving amylose in a first organic solvent capable of dissociating and dissolving said amylose to form a first solution;
b. mixing said first solution with an aqueous acid solution capable of partially hydrolyzing said dissociated amylose to form a second solution;
c. heating said second solution to partially hydrolyze said dissociated amylose into lower molecular weight segments;
d. mixing said second solution containing said partially hydrolyzed amylose with a second organic solvent capable of stripping the first organic solvent from the hydrolyzed amylose to form a third solution, and allowing a precipitate to form in said third solution; and



e. collecting, washing and drying said precipitate to form water-soluble amylose.

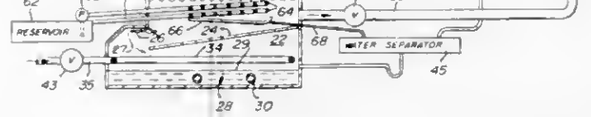
VAPOR DEGREASING SYSTEM HAVING A DIVIDER WALL BETWEEN UPPER AND LOWER VAPOR ZONE PORTIONS

Burton Rand, Norristown, Pa., assignor to Autosonics Inc., Norristown, Pa.

Filed Mar. 1, 1976, Ser. No. 662,750
Int. Cl.² B08B *5/00*
U.S. Cl. 134—11 **16 Claims**



6. Apparatus comprising a housing having a sump adapted to contain a vaporizable solvent, a first condensor means supported by the housing adjacent the upper end thereof and defining the upper end of a vapor zone in said housing, a second condensor means in said housing above the sump, a dividing wall at an elevation between the elevation of said first and second condensor means, a movable closure member cooperating with said wall and movable between opened and closed positions for providing selective communication between an upper portion of the vapor zone above the elevation of said wall and a lower portion of the vapor zone below said wall, and means connected to said housing above the elevation of said wall for removing residual vaporized solvent from the upper portion of said vapor zone and returning condensate thereof to said sump when said closure member is in its closed position and the upper portion of vapor zone is isolated from the lower portion of the vapor zone.

14. A method of cleaning comprising:
a. introducing work to be cleaned into a housing having a vapor zone divided into an upper portion and a lower portion, said upper and lower portions being in communication with each other, said work being introduced into said upper portion of said vapor zone;
b. introducing vaporized solvent into each portion of said vapor zone, cleaning said work by contact with said vapors;

c. using an upper condensor means to limit the upper extent of said vapor zone;
d. introducing a coolant into a lower condensor means located in said lower portion of said vapor zone when the work is cleaned, drawing hot vapors from the upper portion of said vapor zone into said lower portion of said vapor zone by said lower condensor means;
e. interrupting communication between said portions of said zone;
f. removing residual vapors from said upper portion of said zone and from said work; and
g. removing said work from said upper portion of said zone.

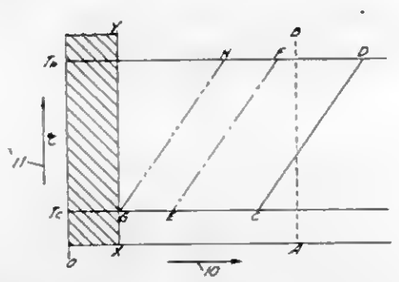
THERMOELECTRIC GENERATORS THAT INCORPORATE SELF-SEGMENTING THERMOELECTRIC LEGS

Edward F. Hampl, Jr., St. Paul, Minn., assignor to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Continuation of Ser. No. 293,862, Oct. 2, 1972, abandoned, which is a continuation of Ser. No. 36,131, May 11, 1970, abandoned, which is a continuation-in-part of Ser. No. 635,948, April 20, 1967, abandoned, which is a continuation-in-part of Ser. No. 463,148, June 11, 1965, abandoned. This application May 28, 1974, Ser. No. 473,553

Int. Cl.² H01V *1/14*

U.S. Cl. 136—205 — 5 Claims



1. In a thermoelectric generator,

A. at least one thermoelectric leg that exhibits a figure of merit of at least 0.5×10^{-3}; is operable at temperatures up to at least 800° C; consists essentially of metal elements and chalcogen elements united in a crystal lattice structure that is stoichiometric except for an excess or deficiency of metal sufficient to provide the current carriers needed for a thermoelectric composition; and has the property that atoms of said excess or deficient metal migrate from a first end of the leg toward the second end under the combined influence of thermal and electrical gradients applied to the leg by operation of said thermoelectric generator, said migration (a) forming an inherently stable gradation of current-carrier concentrations that is beneficial for thermoelectric conversion, and (b) causing the migrating metal element to be present at the second end of the leg at substantially the maximum solubility limit for the element in the lattice structure; each said thermoelectric leg in said generator having:

B. a contact member metallurgically bonded to the second end of the thermoelectric leg, with at least the exterior thickness of the contact member against the end of the thermoelectric leg consisting essentially of metal that includes said migrating metal element at substantially its free-state chemical potential; and

C. a contact member in electrical contact with the first end of the leg consisting essentially of metal that is free of said migrating metal element at its free-state chemical potential;

whereby as soon as said thermoelectric generator is operated to apply said combined thermal and electrical gradients to the leg, the migrating metal element in the second end of the leg will be in equilibrium with the migrating metal element in the contact member against the second end of the leg to permit the generator to exhibit steady-state operation.

4,029,521
THERMOELECTRIC DETECTOR

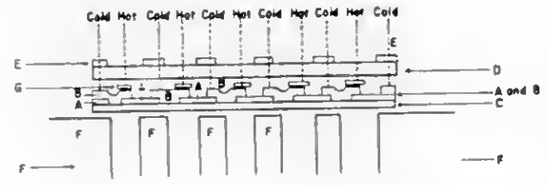
Uzi Korn, and Shmuel Shtrickman, both of Rehovot, Israel, assignors to Yeda Research & Development Co. Ltd., Rehovot, Israel

Filed Oct. 3, 1975, Ser. No. 619,687

Claims priority, application Israel, Oct. 4, 1974, 45788

Int. Cl.² H01L *35/02*

U.S. Cl. 136—225 — 4 Claims



1. A fast thermoelectric detector comprising, in combination: a plurality of thermocouple junctions connected in series in a meandering path consisting of a plurality of rows, each row including a plurality of substantially reactangular deposits of two different thermoelectrically active materials having overlap between deposits of said different materials which define said junctions; a thin support structure, said deposits being located on said thin inert support structure; and a tunnel structure on a thermally conducting base and defining a plurality of tunnels, said support structure being above said tunnel structure and said tunnels being substantially perpendicular to said rows of said meandering path of said junctions, said tunnels being located beneath those of said junctions which are hot junctions and material of said base being in good thermal contact beneath those of said junctions which are cold junctions.

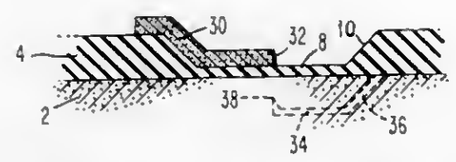
4,029,522
METHOD TO FABRICATE ION-IMPLANTED LAYERS WITH ABRUPT EDGES TO REDUCE THE PARASITIC RESISTANCE OF SCHOTTKY BARRIER FETS AND BIPOLAR TRANSISTORS

Francisco H. De La Moneda, Reston, Va., assignor to International Business Machines Corporation, Armonk, N.Y.

Filed June 30, 1976, Ser. No. 701,375

Int. Cl.² H01L *21/265*

U.S. Cl. 148—1.5 — 23 Claims



1. A method for forming an asymmetrical buried, conductive layer in a semiconductor, comprising the steps of:

forming a first layer on the surface of a semiconductor substrate, having an opening with a tapered sidewall;

forming a layer of lift-off resist over said first layer overlapping said tapered sidewall, with a substantially vertical edge inside said opening in said first layer, leaving a portion of said opening in said first layer uncovered;

forming an ion-stopping layer over said lift-off resist layer and over said portion of said opening in said first layer, with a substantially vertical edge juxtaposed with and formed by said vertical edge of said lift-off resist layer;

lifting off said ion-stopping layer over said lift-off resist layer, uncovering said tapered sidewall, leaving a residual portion of said ion-stopping layer over said portion of said opening in said first layer;

ion-implanting a semiconductor dopant material into said semiconductor substrate outside of the region covered by said ion-stopping layer;

whereby a conductive layer is formed in the bulk of the substrate having a first end substantially following the contour of said tapered sidewall and a second end abruptly terminating within the bulk of said substrate.

4,029,523
SOLVENT PHOSPHATIZING COMPOSITIONS YIELDING NON WATER SOLUBLE COATINGS

Edward A. Rowe, Jr., and William H. Cawley, both of Mentor, Ohio, assignors to Diamond Shamrock Corporation, Cleveland, Ohio

Filed Mar. 20, 1975, Ser. No. 560,377

Int. Cl.² C23F *7/10*

U.S. Cl. 148—6.17 — 30 Claims

1. An organic phosphatizing composition having a continuous and homogeneous liquid phase suitable for phosphatizing metal with a coating of at least substantial water insolubility, with said liquid phase containing water in minor amount, which composition comprises:

A. organic solvent providing liquid phase homogeneity, with an organic solubilizing liquid while being a non-solvent for a phosphatizing proportion of phosphoric acid in said composition, said solvent being unreactive with phosphoric acid in said composition;

B. solubilizing liquid capable of solubilizing phosphoric acid in said composition while retaining liquid phase composition homogeneity, said solubilizing liquid being unreactive with phosphoric acid in said composition;

C. a phosphatizing proportion of phosphoric acid;

D. aprotic polar organic compound soluble in said composition while retaining liquid phase homogeneity; and,

E. water in an amount above about 2% and exceeding said proportion of phosphoric acid while being sufficient for said composition to provide a phosphatized coating of substantial water insolubility on a ferrous metal substrate in phosphatizing contact with said composition, and while retaining liquid phase homogeneity.

4,029,524
HEAT TREATING PROCESS FOR A ROD WITHIN A FLUIDIZED BED

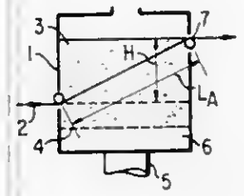
Eiji Takahashi, Nishinomiya; Masaru Shimizu, Kobe; Yasuhiro Oki, Kobe, and Osamu Ishigami, Kobe, all of Japan, assignors to Kobe Steel Ltd., Kobe, Japan

Filed Jan. 14, 1976, Ser. No. 649,151

Claims priority, application Japan, Jan. 14, 1975, 50-6886

Int. Cl.² C21D *1/74*

U.S. Cl. 148—13.1 — 3 Claims



1. A heat treating process for a rod by the use of a fluidized bed maintained at a constant temperature and having a constant length and which is composed of solid particles suspended by means of a pressurized gas, comprising the steps of:

introducing a heated rod at a predetermined temperature and at a constant rate of speed through an inlet opening into said fluidized bed so as to travel therethrough for heat treatment;

passing said rod through said fluidized bed in an upwardly inclined manner so as to exit from the surface of said fluidized bed; and

adjusting the resulting tensile strength of said rod by varying the soaking time of said rod within said fluidized bed as a result of varying the distance from said inlet to the point at which said rod emerges from the surface of said fluidized bed.

HIGH STRENGTH WROUGHT ZINC ALLOY

David L. Dollar, Greeneville, Tenn., assignor to Ball Corporation, Muncie, Ind.

Division of Ser. No. 573,292, April 30, 1975, Pat. No. 3,966,505, which is a continuation-in-part of Ser. No. 469,973, May 15, 1974, abandoned. This application Feb. 20, 1976, Ser. No. 659,613

Int. Cl.² C22F *1/16*

U.S. Cl. 148—32 — 2 Claims

1. A zinc alloy having superior age stability and tensile strength greater than 65,000 psi consisting of, by weight, 20–28 weight percent aluminum, 0.1 to 3.5 percent weight copper, 0.01 to about 0.5 weight percent magnesium, and the balance being zinc, said alloy having a homogenized structure.

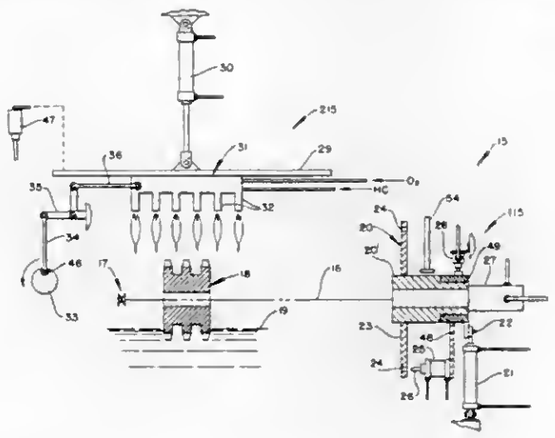
4,029,526
METHOD OF FLAME HARDENING GEARS

James David Carrigan, Odessa, Tex., assignor to Vance Industries, Inc., Odessa, Tex.

Division of Ser. No. 406,141, Oct. 15, 1973, Pat. No. 3,891,194. This application June 16, 1975, Ser. No. 586,911

Int. Cl.² C21D *9/32*

U.S. Cl. 148—147 — 9 Claims



1. Method of flame hardening the teeth of a gear having radially spaced rows of teeth thereon comprising the steps of:

1. rotatably supporting a gear such that the gear is held stationary for a first time interval and thereafter rapidly rotated about the central axis thereof and again held stationary for a second time interval;

2. positioning a burner means such that combustion products form a flame which is emitted therefrom to provide a flame which directly impinges upon a single row of teeth;

3. positioning a quench means in spaced relationship to said burner means to enable one row of gear teeth to be quenched;

4. positioning the gear respective to the burner means and the quench means such that spaced rows of teeth thereof are simultaneously treated, with one row of teeth being subjected to a heating action and another row of teeth to a quenching action, with there being other rows of teeth circumferentially disposed in each direction about the gear and between the rows of teeth being heated and quenched;

5. supplying sufficient heat at the burner means to cause the metal of a row of teeth located at the burner means to attain a temperature which forms an austenitic structure;

6. supplying sufficient cooling at the quench means to cause the metal of a row of teeth located at the quench means to be cooled at a rate which avoids the formation of decomposition products;
7. rotating the gear about its central axis an amount which causes the row of gear teeth located at the burner means to be directly transferred to the quench means;
8. cyclicly carrying out the previous step a sufficient number of times to cause the gear to rotate a plurality of revolutions while all of the individual rows of gear teeth are subjected to the heating action of the burner means and the cooling action of the quench means a single time before any one row of teeth can be subjected to the action of the burner means a second time.

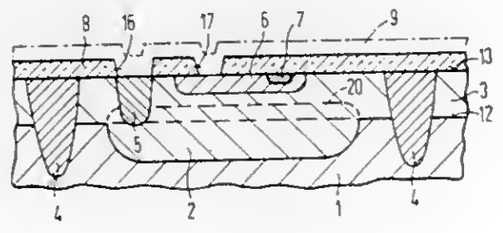
METHOD OF PRODUCING A DOPED ZONE OF A GIVEN CONDUCTIVITY TYPE IN A SEMICONDUCTOR BODY

Andreas Glasl, Haar, and Helmuth Murrmann, Ottobrunn, both of Germany, assignors to Siemens Aktiengesellschaft, Berlin & Munich, Germany

Filed June 18, 1975, Ser. No. 587,966
Claims priority, application Germany, June 21, 1974, 2429957
Int. Cl.² H01L 21/223
U.S. Cl. 148—187 1 Claim



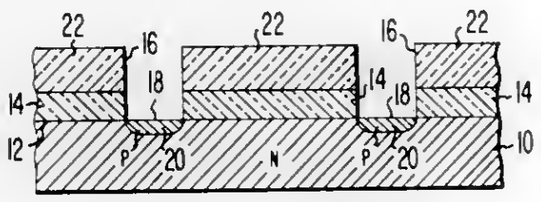
1. In a process of producing a n-conductivity type doped zone in a silicon semiconductor body wherein a silicon polycrystalline semiconductor layer is deposited on the surface of the zone to be doped, the improvement comprising:
depositing an undoped silicon polycrystalline semiconductor layer on the surface of the zone to be doped; and
diffusing PH_3 through said undoped polycrystalline layer and into said zone in the semiconductor body.

4,029,528

METHOD OF SELECTIVELY DOPING A SEMICONDUCTOR BODY

Wojciech Rosnowski, Summit, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Aug. 30, 1976, Ser. No. 718,806
Int. Cl.² H01L 21/223
U.S. Cl. 148—187 5 Claims



1. A method of selectively doping a silicon body with aluminum impurities comprising the steps of:
forming a layer of silicon dioxide on a surface of said body;
selectively exposing portions of said surface through said layer; and
subjecting said body to aluminum impurities at a temperature and for a time to form a pocket having a preselected surface impurity concentration and pre-drive in depth beneath said portions of said surface, said layer having a thickness such that said impurities are prevented from reaching said surface therebeneath.

CROSSLINKED CARBOXYL CONTAINING POLYMER AND NITROCELLULOSE AS SOLID PROPELLANT BINDER

Donald E. Elrick, Rawlings, and Harry Gilbert, Cumberland, both of Md., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed July 12, 1967, Ser. No. 653,301
Int. Cl.² C06B 45/10
U.S. Cl. 149—19.6 16 Claims

1. An energetic binder composition, particularly adaptable for use in a composite-modified double or single base propellant, which comprises the admixture of up to about 98.5% nitrocellulose with at least 1% of a carboxy polymer having a carboxyl equivalent of from about 0.03 to 0.06 equivalents/hundred grams, said admixture being cross-linked with a multifunctional curing agent in an amount sufficient to improve the mechanical properties of the binder relative to the corresponding non-cross-linked binder.

4,029,530

METHOD OF FORMING LEAD STYPHNATE AMMUNITION PRIMING MIXTURE

Joseph F. Kenney, Bridgeport, Conn., assignor to Remington Arms Company, Inc., Bridgeport, Conn.

Continuation-in-part of Ser. No. 489,704, July 18, 1974, abandoned. This application Feb. 12, 1976, Ser. No. 657,487
Int. Cl.² C06B 41/06
U.S. Cl. 149—28 5 Claims

1. The method of making a normal lead styphnate priming composition which consists of reacting styphnic acid substantially free from sulphuric acid, the nitro derivatives of resorufin, the nitro derivatives of indophenol and the nitro derivatives of resazurin in the presence of water with an inorganic non-explosive compound of lead selected from the group of lead compounds consisting of lead oxide, basic lead carbonate, lead carbonate, and lead hydroxide to produce a workable, granular, wet mass of normal lead styphnate , and no by-products of the reaction except water or water and carbon dioxide said reaction taking place in the presence of gum arabic and a tetracene sensitizer incorporated in the reacting mass and, after the reaction has been completed, incorporated in the workable granular still wet mass an oxygen donor and a frictionator.

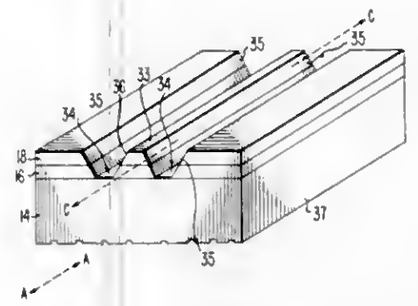
METHOD OF FORMING GROOVES IN THE [0$\bar{1}$1] CRYSTALLINE DIRECTION

Donald Paul Marinelli, Trenton, N.J., assignor to RCA Curporation, New York, N.Y.

Filed Mar. 29, 1976, Ser. No. 671,555
Int. Cl.² H01L 21/312
U.S. Cl. 156—647 7 Claims

1. A method of forming groove along the [0$\bar{1}$1] crystalline direction of a body of semiconductor material a portion of which is gallium arsenide or gallium aluminum arsenide along a (100) surface of said body, comprising the steps of:
applying to the (100) surface an etchant for at least 15 seconds at a temperature on the order of 80° C., said etchant being a solution by weight percent of 47.5% water, H_2O, 0.2% silver nitrate, $AgNO_3$, 23.8% of chromium trioxide, CrO_3, 28.5% of a 48% aqueous solution of hydrofluoric acid, HF, said etchant forming a pattern of elongated etch pits whose longitudinal axes are in the [0$\bar{1}$1] crystalline direction; and

forming grooves in said body at a surface opposite said surface on which said etchant is applied with said grooves



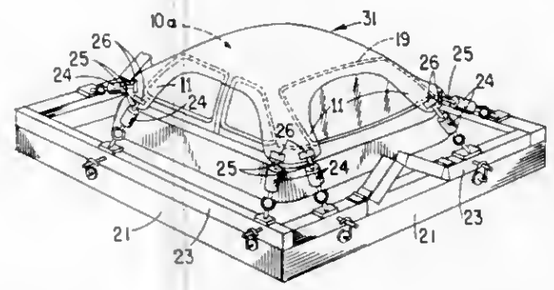
being aligned with the longitudinal axes of said etch pits so that said grooves are formed along the [0$\bar{1}$1] crystalline direction.

4,029,532

METHOD OF PRESHAPING AND INSTALLING CAR PLASTIC TOP

John G. Warhol, 14041 Vernon Ave., Oak Park, Mich. 48237, and Milton P. Ritter, 26400 Telegraph Road, Southfield, Mich. 48034

Filed July 19, 1976, Ser. No. 706,754
Int. Cl.² E04F 13/02
U.S. Cl. 156—71 3 Claims



1. In a process for applying a flexible plastic top sheet material to the outer surface of a metal real car body top, the steps which consist in preliminarily shaping sheet plastic roof material over a clean car body top mold, applying a matrix generating material to the outer surface of such preshaped plastic material to provide an assembly of a rigid support matrix and said preshaped plastic material, coating the cooperating available clean surfaces of the plastic portion of said assembly and the clean surface of a real car body top with adhesive material, applying said assembly to said real car body top so that the coated surfaces can contact each other for permanent union between the real car body top and the cemented surface of the plastic material and thereafter removing the matrix from said plastic material after said plastic material has been attached to said real car roof top.

4,029,533

METHOD OF FORMING GLASSY MATERIALS FROM PLUMBITES AND CELLULOSICS

Truman L. Ward; Ruth R. Benerito, both of New Orleans, and Jacques J. Hebert, Metairie, all of La., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Division of Ser. No. 499,689, Aug. 22, 1974, Pat. No. 3,926,709. This application Sept. 8, 1975, Ser. No. 611,370
Int. Cl.² C03B 29/00; C04B 33/34, 37/00
U.S. Cl. 156—89 2 Claims

2. A process for imparting aesthetic design and decoration, or a label to glass or ceramic surfaces, the process comprising . . .
a. placing a cellulosic textile premodified by reaction with sodium plumbite to a lead content of about 5 to 15%, on the surface of the glass or ceramic to which it is to be physically bound, and said textile shaped into the desired relief or other configuration,
b. inserting the assembly into a closed oven at or below 200° C.
c. elevating the oven temperatures to about 600° to 700° C., and
d. maintaining the elevated temperature for about 60 minutes, and
d. cooling the oven and material gradually to avoid fracturing the original glass or ceramic.

4,029,534

COMPOSITE MATERIALS AND PROCESSES FOR THEIR PRODUCTION

Paul J. Bocks, Viersen; Jurgen Grammel, Cologne, and Hermann Neumaier, Leichlingen, all of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Germany

Division of Ser. No. 373,354, June 25, 1973, Pat. No. 3,989,870. This application July 14, 1976, Ser. No. 705,329
Int. Cl.² B32B 31/00
U.S. Cl. 156—246 10 Claims

2. A process for the production of a composite material consisting of a homogeneous or microporous plastic sheet and a polyurethane foam wherein said process comprises:
a. spreading on a transfer support a coating of an ionomer latex foam having a gross density of 0.04 to 0.40 g/cm³ produced by a churning process from an ionomeric polyurethane dispersion having
i. a solids content of 45 to 62% by weight of polyurethane,
ii. a viscosity of 10 to 70 seconds outflow time from a Ford measuring cup with a 4 mm nozzle,
iii. a particle diameter of 0.05 to 10 μ,
iv. an ionic group content of 2 to 40 milliequivalents per 100 g of polyurethane solids of ions selected from the group consisting of

$$\geq N^{+}- \;,\; -COO^{-} \;,\; -SO_3^{-} \;,\; \text{and } RO-\underset{\underset{O}{\|}}{P}-O^{-}$$

wherein R is hydrogen or a lower alkyl group, and
v. a tensile strength of at least 40 kg/cm² when dried to a homogeneous polyurethane foil, and which contains
i. 1–10% by weight of a foam stabilizing agent, based on the weight of solid polyurethane,
ii. 0–100% by weight of inorganic fillers based on the weight of solid polyurethane,
iii. 0–30% by weight of crosslinking agent based on the weight of solid polyurethane, and
iv. 0.1 to 10% by weight of thickener based on the weight of solid polyurethane;
b. while said foam is still liquid, applying thereto, using light pressure, a self-supporting homogeneous or microporous plastic sheet;
c. allowing the composite material to dry; and
d. removing said transfer support.

4,029,535

PROCESS FOR SEAMING FABRICS COMPRISING THERMOPLASTIC FIBERS USING LASER BEAMS

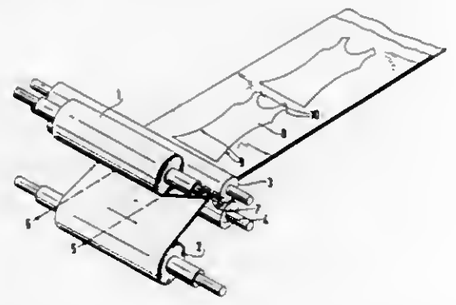
Cyril George Cannon, and Alan Selwood, both of Harrogate, England, assignors to Imperial Chemical Industries Limited, London, England

Continuation of Ser. No. 564,506, April 2, 1975, abandoned. This application Sept. 1, 1976, Ser. No. 719,534

Claims priority, application United Kingdom, Apr. 16, 1974, 16446/74

Int. Cl.² B23K *31/00*; **B29C** *27/02*

U.S. Cl. 156—272 **3 Claims**



1. An improved process for seaming together two fabrics comprising fibers formed from thermoplastic polymers comprising heating the fabrics and combining the fabrics by passing them through a nip and exposing a line of contact between the fabrics to a heat source, wherein the improvement comprises directing at said line of contact a pulsed or chopped focused beam of energy from a laser traversable along said line of contact of said fabrics, said energy of said beam being sufficient to melt at least part of said contacting surfaces of said fabrics, but is insufficient to penetrate through said fabrics.

4,029,536

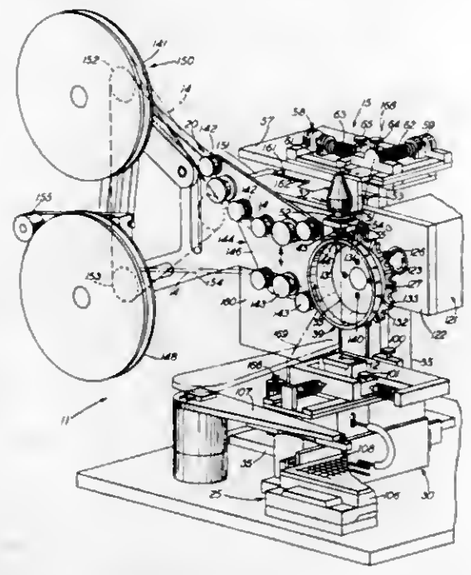
METHODS OF AND APPARATUS FOR MOUNTING ARTICLES TO A CARRIER MEMBER

Ernest Kovacs, Allentown; David P. Ludwig, and Friedich Zwickel, both of Whitehall, all of Pa., assignors to Western Electric Company, Inc., New York, N.Y.

Filed Apr. 7, 1976, Ser. No. 674,336

Int. Cl.² B29C *17/00*; **B32B** *31/00*; **B65C** *11/04*

U.S. Cl. 156—285 **16 Claims**



1. A method of loading an article onto a site on a carrier tape which comprises:

engaging a portion of the tape including the site with a locating means;

moving the site against an adhesive applicator to apply adhesive to predetermined areas of the site;

maintaining the engagement of the portion of the tape with the locating means while indexing the site into vertical alignment with an article; and then

moving the adhesive-applied site toward and against the article without releasing the engagement of the portion of the tape from the locating means until after the article has been loaded to the site by contact with the adhesive on the site.

4,029,537

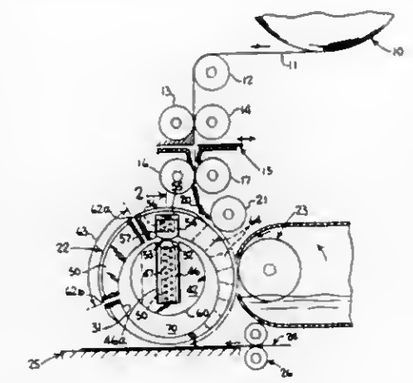
LABEL APPLICATOR

Richard E. Kish, Fairfield, Conn., assignor to Pitney-Bowes, Inc., Stamford, Conn.

Filed Dec. 8, 1975, Ser. No. 638,552

Int. Cl.² B65C *9/14*, *9/18*

U.S. Cl. 156—497 **3 Claims**



1. In a label applying apparatus having a rotatable applicator drum, means for feeding a series of labels to a first position adjacent the periphery of said drum, and means for feeding a label receiving document past a second position adjacent the periphery of said drum; the improvement comprising

a stationary shaft partially disposed within and rotatably supporting said drum;

vacuum generating means disposed within said drum operative in response to the rotation of said drum, including an internal cylindrical surface formed in said drum having an axis of rotation which is eccentric relative to the axis of said shaft to thereby define a chamber of variable radial distance between said drum and said shaft and radially movable blade means that slidably cooperate with the walls of said chamber; and

vacuum passage means formed and communicating between said chamber and a portion of the periphery of said drum whereby a partial vacuum is generated when said peripheral drum portion is located at said first position and whereby said partial vacuum is released as said drum peripheral portion passes said second position.

4,029,538

ULTRASONIC FILM SPLICER

Wallace I. Vance, Jr., Torrance, Calif., assignor to Metro/Kalvar Corporation, Darien, Conn.

Continuation of Ser. No. 363,091, May 23, 1973, abandoned. This application July 13, 1976, Ser. No. 704,806

Int. Cl.² B65H *21/00*; **G03D** *15/04*

U.S. Cl. 156—502 **8 Claims**

1. A film splicer comprising:

ultrasonic energy generating means mounted in a fixed position and including a transducer having a horn portion provided with a narrow elongated working edge, said transducer when energized generating vibratory motion in the ultrasonic range at said horn portion;

anvil means having a rotatably mounted circular member operably disposed opposite said working edge of the horn along its longitudinal axis for movement thereover in a spaced apart relationship to form a compression zone wherein film strips to be spliced across their widths may be fed into contact with the working edge of said horn portion and said circular anvil member;

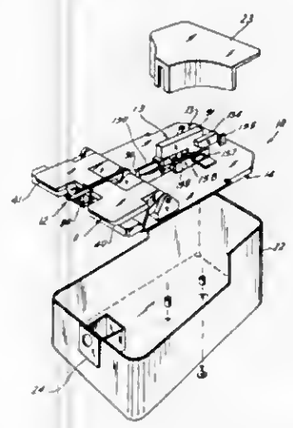
control means operably connected to said anvil means for controlling the rate of movement of said rotatably mounted circular member over said working edge;

film cutting means operably positioned in proximity to the horn portion of said transducer; and

two film block assemblies rotatably positioned in a substantially horizontal plane in spaced apart relationship on opposite sides of the arrangement of said film cutting means and said transducer, said assemblies including means for causing said assemblies to converge towards one another when the assemblies are rotated upwards and backwards from a position adjacent said cutting means to a position adjacent the working edge whereby film strips clamped in said film block assemblies and severed by said cutting means converge toward each other and cause the severed edges of the strips to overlap said working edge within the compression zone.

6. A film splicer comprising:

ultrasonic energy generating means including a transducer having a horn portion provided with a narrow elongated



working edge, said transducer when energized generating vibratory motion in the ultrasonic range at said horn portion;

anvil means operably disposed opposite said working edge of the horn along its longitudinal axis is spaced apart relationship with said horn to form a compression zone wherein film strips to be spliced across their widths may be fed into contact with the working edge of said horn portion and said anvil member;

means for selectively producing relative movement between the anvil and the working edge of said horn by an amount corresponding to differing widths of film strips to be spliced;

film cutting means operably positioned in proximity to the horn portion of said transducer; and

two film block assemblies rotatably positioned in a substantially horizontal plane in spaced apart relationship on opposite sides of the arrangement of said film cutting means and said transducer, said assemblies including means for causing said assemblies to converge towards one another when the assemblies are displaced from a position adjacent said cutting means to a position adjacent the working edge whereby film strips clamped in said film block assemblies and severed by said cutter means converge toward each other and cause the severed edges of the strips to overlap said working edge within the compression zone.

4,029,539

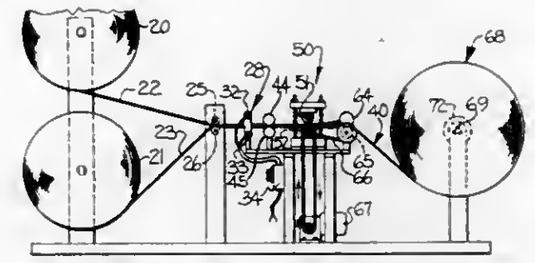
APPARATUS FOR FORMING A STRETCHABLE TUBULAR PACKAGING MATERIAL

Brendan L. Doll, Patterson, N.C., assignor to Cellu Products Company, Patterson, N.C.

Continuation-in-part of Ser. No. 223,246, Feb. 3, 1972, Pat. No. 3,834,969. This application Sept. 7, 1972, Ser. No. 286,701

Int. Cl.² B32B *31/00*; **B29D** *7/06*

U.S. Cl. 156—513 **3 Claims**



1. An apparatus for producing a stretchable tubular packaging material from elongate foam sheet material and which is adapted to receive and package articles therein, said apparatus comprising

means for guiding two advancing sheets of flexible foam sheet material into a contiguous overlying relationship to form overlying layers of the sheet material,

means positioned downstream of said guiding means for longitudinally severing the two advancing overlying layers of sheet material along a plurality of parallel lines and fusibly uniting the thusly formed adjacent side edges of the two layers along each of the parallel lines to form the same into a plurality of elongated flattened tubular members, said severing and uniting means comprising a plurality of laterally spaced, relatively thin electrically operable heating elements generally perpendicular to the direction of advance of the overlying layers and positioned to extend entirely through the advancing layers,

slitting means for slitting the two advancing overlying layers of the sheet material in a pattern of spaced apart rows of spaced incisions with the incisions of adjacent rows being staggered, said slitting means including a pair of rolls forming a nip therebetween through which said overlying layers pass, one of said rolls having a plurality of axially spaced substantially annular rows of spaced cutting blades projecting radially therefrom, the blades in adjacent annular rows being staggered to form said incisions through the two layers of foam material,

spreading means positioned downstream of said slitting means and engaging the interior of each tubular member for spreading opposing halves thereof to insure that they may be thereafter readily separated, and

means for advancing the two layers of flexible foam sheet material through said guiding means, and severing and uniting means, and said slitting means.

4,029,540

APPARATUS FOR FRAMING A PLURALITY OF X-RAY PHOTOGRAPHS OF A GIVEN SIZE

Herbert Weldanz, Kursiefener Strasse 16a, 5074 Odenthal-Globusch; Gerhard Sandt, Heimfriedweg 33, 5 Cologne-Hohenhaus, and Werner Samoray, Im Leuchterbruch 32, 5 Cologne 80, all of Germany

Filed Oct. 22, 1976, Ser. No. 735,077

Claims priority, application Germany, Oct. 25, 1975, 2547924

Int. Cl.² B32B *31/00*

U.S. Cl. 156—522 **30 Claims**

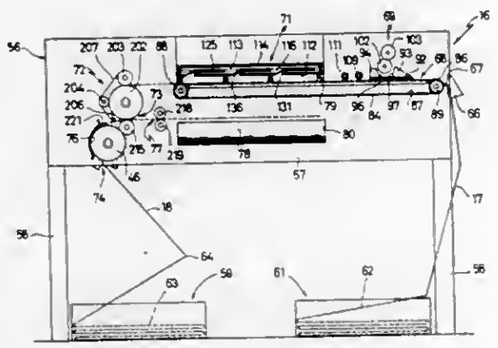
1. Apparatus for framing a plurality of X-ray photographs of a given size with the aid of a flexible frame which comprises two frame cards and in which the photographs are mounted

between recesses in the frame cards adapted to the size of the photographs, at least one of which cards is in the form of a mount with a self-adhesive coating of glue, with which the card adheres to parts of the photographs extending beyond the recess edges, both the adhesive-coated card and its covering frame card being provided along their lateral edges with perforations for cooperating with a transporting device using pin feed means, comprising

a first transporting device for said adhesive-coated card having a flat transporting section,

a photograph dispensing means arranged above said first transporting device by means of which the photographs are arranged in a predetermined order and applied to said adhesive-coated card in this order,

said photograph dispensing means comprising a frame which consists of relatively thick upper and lower plates provided with recesses of the same shape and size as those in said frame cards, which can be removably inserted into the apparatus, said frame having an opening which leads into said recesses, the photographs being arranged in the said frame at a distance from the transporting plane of said first transporting device which is substantially less than the length of the photographs measured in the transporting direction, in which frame the photographs can be slideably mounted in letter box-like compartments for guiding in the transport direction, the lower frame plate



being provided with an exit slit and guideface for each compartment in the direction of transport and inclined towards the transporting plane, through which slit the photograph can be applied to said adhesive card via said guide face,

a pusher means which drops into said opening in said frame leading into said recesses, which can engage on the rear edge of the photograph directed away from said slit to move this edge,

a deflecting mechanism following said first transporting device which diverts said adhesive card provided with photographs and moving in the transport direction,

a pressure glueing station to which said adhesive card is directed where said covering card is glued to the adhesive card,

a second transporting device which conveys said covering card to said pressure glueing station, which can be synchronized with said first transporting device in such a manner that said covering card and said adhesive card meet with a coincident arrangement of their recesses at the pressure glueing station,

a transfer mechanism following said pressure glueing station which grips the glued-together frame and transfers the frame to a delivery station,

a delivery station following said transfer mechanism for receiving said frame.

4,029,541

MAGNETIC RECORDING DISC OF IMPROVED DURABILITY HAVING TIN-NICKEL UNDERCOATING

Malcolm Barlow, Sunnyvale, and Jerry R. Lundquist, San Jose, both of Calif., assignors to Ampex Corporation, Redwood City, Calif.

Continuation-in-part of Ser. No. 485,812, July 5, 1974, abandoned. This application Feb. 19, 1976, Ser. No. 659,528

Int. Cl.² H01L *21/306*

U.S. Cl. 427—130 **3 Claims**

1. The process of making a magnetic recording medium comprising the following steps:

a. providing a metallic, non-magnetic substrate,

b. forming an electroless-nickel coating on said substrate,

c. polishing said electroless-nickel coating,

d. forming a tin-nickel layer over said electroless-nickel having a thickness of from 150 microinches to 1 mil.

e. forming a magnetic film selected from cobalt-nickel-phosphorus and cobalt-phosphorus over said tin-nickel film,

f. etching the surface of said film to produce a color change on said surface with an aqueous solution of a mild oxidizing agent selected from an aqueous nitric acid solution having a strength of 0.1 to 0.01 percent and an aqueous solution of ammonium persulfate having a strength of 0.01 to 1 percent, in the absence of a chelating agent, and

g. baking the composite structure at a temperature of from 225° to 325° C. for a time of from ½ to 6 hours.

4,029,542

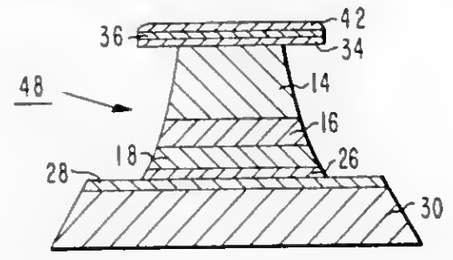
METHOD FOR SLOPING THE SIDEWALLS OF MULTILAYER P+ PN+ JUNCTION MESA STRUCTURES

George Allan Swartz, Plainsboro, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Sept. 19, 1975, Ser. No. 614,889

Int. Cl.² H01L *21/306*

U.S. Cl. 156—649 **2 Claims**



1. In a method for making a junction mesa structure from a semiconductor wafer wherein the wafer comprises a first layer having a masked area and an unmasked area comprising first layer molecules, a substrate, and a second layer comprising second layer molecules in between the first layer and the substrate and adjacent first layer and the substrate, the first layer and the second layer adapted to etch at substantially different etch rates in an etchant comprising 3% hydrofluoric acid and 97% nitric acid, the etchant further comprising etchant molecules which chemically remove first layer molecules from the first layer and second layer molecules from the second layer, the second layer molecules being removable substantially faster than said first layer molecules, the method comprising the steps of first contacting all of the unmasked area of the first layer with said etchant, removing the unmasked area of the first layer and removing a portion of said second layer unmasked by the masked area of the first layer, the improvement comprising the steps fo providing a known total quantity of the etchant molecules in the amount of 63 liters of etchant per cubic centimeter of the first layer in the unmasked area, providing a known total quantity of the first layer molecules in the unmasked area such that a ratio of said known total quantity of etchant molecules to said first layer

molecules in the unmasked area is approximately 631:1 and chemically consuming a known part of the etchant molecules by using said known part to consume the unmasked area of the first layer, and unconsumed quantity of the etchant molecules remaining after a reaction between the known total quantity of the etchant molecules and the known total quantity of the unmasked first layer molecules, the first layer being a P silicon semiconductor layer, the second layer being an N+ silicon semiconductor layer whereby the second layer is etched by the unconsumed quantity of etchant molecules at essentially the same rate as the first layer.

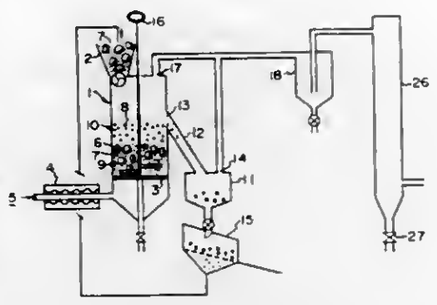
PROCESS FOR THE DRY DISTALLATION OF RUBBER

Shigeo Mitsui, Ebetsu; Tomiyasu Araki, Sapporo; Kazuhiko Niikawa, Sapporo; Hideo Hosoda, Sapporo; Yoshio Jyo; Ryuichiro Yoda, both of Yokohama; Giichi Suzuki, Kudamatsu; Takasi Iijima, Yokohama; Hiroshi Tanaka, Yokohama; Yasutaka Ochiai, Yokohama, and Takashi Ise, Yokohama, all of Japan, assignors to Agency of Industrial Science & Technology; Nippon Zeon Co., Ltd. and Japan Gasoline Co., Ltd., all of Tokyo, Japan

Filed Jan. 2, 1974, Ser. No. 429,980
Claims priority, application Japan, Jan. 5, 1973, 48-2942
Int. Cl.² C10B *57/04*
U.S. Cl. 201—2.5 **16 Claims**



1. An autothermic process for the dry distillation of rubber in a fluidized bed-forming oven means comprising:

1. heating, in an oxygen-containing fluidizing gas stream, rubber blocks under agitation by an agitation means, in the presence of carbon powder at temperatures which pulverize the said blocks into rubber particles, under these conditions, and

2. continuing the heating of the thus-obtained rubber particles in an oxygen-containing fluidizing gas stream to temperatures which pyrolyze the said rubber particles thus fluidized, said carbon powder being produced in situ by the pyrolysis.

part of the rubber being burned throughout the process to produce in situ said heating in steps (1) and (2) required for the pulverization and pyrolysis respectively, thereby producing oily materials and solid materials, and then recovering the oily materials separately from the solid materials.

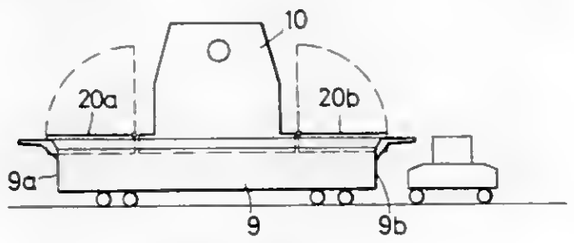
SUCTION ARRANGEMENT FOR WITHDRAWING CONTAMINATED GASES EMITTED FROM INCANDESCENT COKE PUSHED OUT FROM A COKING OVEN

Johann Georg Riecker, Ratingen, Germany, assignor to Hartung, Kuhn & Co. Maschinenfabrik GmbH, Dusseldorf, Germany

Filed Nov. 24, 1975, Ser. Nn. 634,405
Claims priority, application Germany, Nov. 25, 1974, 2455737
Int. Cl.² C10B *27/00*
U.S. Cl. 202—263 **8 Claims**



1. In a coking installation having a row of coke discharge openings, a combination comprising a coke guide car mounted for travel along the row; a coke-quenching car mounted for travel along the row and having a single recess adapted to receive coke pushed out from the coke discharge openings through the coke guide car; a suction arrangement for generating suction; a hood structure mounted for travel along the row of coke discharge openings and including opposite side walls having lower edges, the hood being connectable to the suction arrangement and movable into a position extending over the whole breadth but only a fraction of the length of the quenching car; wind shields provided on said opposite side walls of the hood in the region of the lower edges thereof, the wind shields extending horizontally outwardly from the hood in opposite respective travel directions of the hood and together with said hood having a combined length which is substantially equal to but slightly greater than the length of said quenching car, each of said wind shields having a breadth corresponding to the breadth of the hood; and wind guides provided on transverse end walls of the quenching car and having a breadth corresponding to the quenching car breadth, said wind guides being located slightly below said lower edges of said hood and of said wind shields and each extending horizontally outwardly from the quenching car in one of the opposite travel directions of said quenching car.

4,029,552

PROCESS FOR OBTAINING HIGH PURITY PERFLUORO-n-HEPTANE

George B. Fozzard, Bartlesville, Okla., assignor to Phillips Petroleum Company, Bartlesville, Okla.

Filed Oct. 24, 1975, Ser. No. 625,742
Int. Cl.² B01D *3/34*
U.S. Cl. 203—69 **9 Claims**

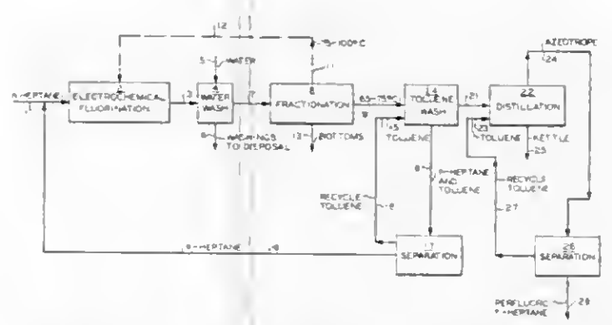
1. The process for obtaining a high purity perfluoro-n-heptane from an electrochemical fluorination product stream derived from the electrochemical fluorination of n-heptane,

wherein said product stream comprises perfluoro-n-heptane, n-heptane, partially fluorinated heptanes, and water soluble acidic components comprising hydrofluoric acid, which process comprises:

a. water-washing said electrochemical fluorination product stream, thereby removing substantially water soluble acidic components and producing a water-washed stream,

b. fractionating said water-washed stream, thereby producing a first overhead fraction rich in perfluoro-n-heptane and n-heptane, a second higher boiling fraction, and a bottoms fraction,

c. washing said first overhead perfluoro-n-heptane rich fraction with toluene, thereby substantially extracting



said n-heptane as an n-heptane-toluene admixture and leaving a raffinate admixture comprising perfluoro-n-heptane and toluene,

d. distilling said raffinate, thereby producing a toluene fraction and a toluene/perfluoro-n-heptane azeotrope,

e. effecting phase separation between said toluene and said perfluoro-n-heptane from said perfluoro-n-heptane/toluene azeotrope, thereby resulting in a substantially toluene rich phase and a substantially rich perfluoro-n-heptane rich phase,

f. drawing off said toluene rich phase from said perfluoro-n-heptane rich phase, and

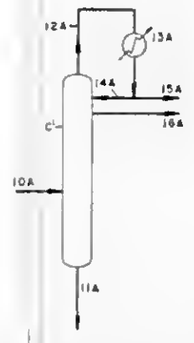
g. recovering said perfluoro-n-heptane as a substantially pure material.

4,029,553

PURIFICATION OF ACETIC ACID STREAMS BY DISTILLATION

Jerry L. Price, Texas City, Tex., assignor to Monsanto Company, St. Louis, Mo.

Filed July 28, 1975, Ser. No. 599,506
Int. Cl.² B01D *3/10*; **C07C** *53/08*
U.S. Cl. 203—94 **10 Claims**



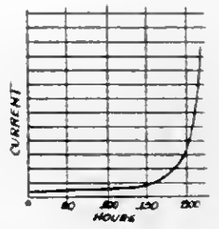
1. A process for the removal of very minor amounts of iodine from acetic acid which consists of introducing acetic acid containing very minor amounts of propionic acid and other high-boiling impurities and iodine into the intermediate section of a fractionation column, withdrawing propionic acid and high-boiling impurities from the bottom of said column, withdrawing and condensing the overhead vapors from said column, withdrawing a minor portion of said condensate and returning the remainder of said condensate as liquid reflux to the top of said column and withdrawing an acetic acid product containing 20 ppb or less of iodine as a liquid sidedraw below the point of reflux entry in the upper one-fourth of said column.

4,029,554

OIL TEST METHOD

Lynn E. Ellison, Crystal Lake, Ill., assignor to Naeco Associates, Inc., Arlington, Va.

Continuation of Ser. No. 471,748, May 20, 1974, abandoned, which is a division of Ser. No. 304,864, Nov. 8, 1972, abandoned, which is a continuation of Ser. No. 106,884, Jan. 15, 1971, abandoned, which is a continuation of Ser. No. 724,977, April 29, 1968, abandoned. This application Nov. 21, 1975, Ser. No. 634,008
Int. Cl.² G01N *27/52*
U.S. Cl. 204—1 T **5 Claims**



1. The method for testing an engine lubricating oil containing oxidation by-product inhibitors and adapted for high stress operating conditions as in aircraft, to determine deterioration of the lubricating properties thereof by the amount of oxidation by-product present therein as the inhibitors lose effectiveness after periods of use, and comprising the steps of: providing a pair of spaced-apart dissimilar electrodes selected from electromotive force series of materials to have different rates of oxidation, sampling the engine lubricating oil after such use and disposing the oil sample without modification thereof as the sole liquid medium between the electrodes in direct contact therewith, with resultant internally sourced current flow between the electrodes produced by oxidation thereof in response to the presence of said oxidation by-products in said oil sample, and electrically indicating deterioration of the lubricating properties of the oil sample to unsafe condition for further use of the engine lubricating oil by change in current flow resulting from the increased amounts of oxidation by-products therein.

4,029,555

HIGH-SPEED CONTINUOUS PLATING METHOD AND APPARATUS THEREFOR

Junichi Tezuka, Isehara, and Takatoshi Ando, Kamakura, both of Japan, assignors to Electroplating Engineers of Japan, Limited, Tokyo, Japan

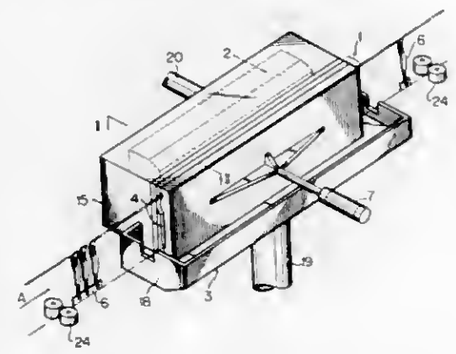
Filed May 7, 1976, Ser. No. 684,291
Claims priority, application Japan, May 23, 1975, 50-61089
Int. Cl.² C25D *5/02*, *5/04*, *5/08*, *17/00*
U.S. Cl. 204—15 **4 Claims**

1. A high-speed continuous plating method of the type employing an anode and solution spray nozzle to plate objects to be plated, wherein while a plurality of objects to be plated which are in complicated continuous form are being fed into and through an object feeding guide tunnel provided in a plating box and having a shape corresponding to the shape of said objects, a plating solution suitable for plating said objects with high current density is continuously sprayed against a solution spraying opening which communicates with said object feeding guide tunnel and has a predetermined dimension, said plating solution being sprayed from a solution spray

nozzle disposed in a position opposite to said solution spraying opening whereby to continuously plate the selected side of said objects at high speed.

2. A high-speed continuous plating apparatus comprising, in combination with an elongated plating box:

masking guide means including an elongated guide tunnel for feeding therethrough objects to be plated, said guide tunnel being adapted to closely confine said objects as



they move through said tunnel, means for feeding objects to be plated through said tunnel, said tunnel having an elongated solution spraying opening communicating with the interior of said plating box for exposing a limited area of said objects to be plated as they pass through said tunnel, an anode and solution spray nozzle disposed in said plating box opposite to said solution spraying opening, and solution recovering means for recovering a plating solution flowing out from said guide tunnel.

4,029,556

PLATING BATH AND METHOD OF PLATING THEREWITH

Emlee Monaco, and Pasquale F. Monaco, both of 5925 W. 130th St., Cleveland, Ohio 44130

Filed Oct. 22, 1975, Ser. No. 624,671
Int. Cl.² C25D *3/60, 5/10*
U.S. Cl. 204—40 **26 Claims**

1. An aqueous acidic plating bath for electrodeposition of a tarnish resistant alloy onto an electrically conductive substrate, said bath comprises ionic compounds of cobalt, tin and a third metal selected from the class consisting of Periodic Groups IV*b* metals and Periodic V*b* metals and combinations thereof, said ionic compounds being present in ranges of: about 50–350 grams per liter cobalt compounds, about5–45 grams per liter tin compounds, and about 0.2–60 grams per liter third metal compounds.

23. A method for bulk plating of the outer surface of small parts forming a randomly-oriented agglomeration, wherein each dimension of said agglomeration of parts is substantially greater than any dimension of the constituent parts of said agglomeration, said parts of said agglomeration being freely movable relative to each other when said agglomeration is tumbled, said method comprising the steps of:

a. placing said agglomeration of parts in a plating barrel;
b. placing said barrel into an aqueous acidic bath including dissociated ionic compounds of tin, cobalt, and a third metal from Periodic Groups IV*b* and V*b*, said ionic compounds being present in the bath in the ranges of about 50—350 grams per liter cobalt compounds, about 5–45 grams per liter tin compounds and about 0.2–60 grams per liter third metal compounds:
c. placing a first electrode into said agglomeration of parts;
d. placing a second electrode into said bath;
e. energizing said electrodes to plate an alloy onto said surfaces of said small parts; and,
f. rotating said barrel during said energizing step.

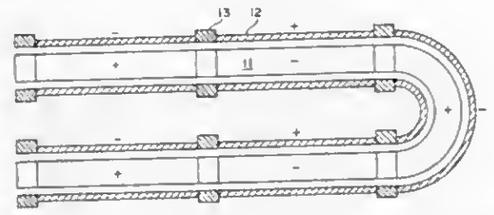
24. A method as defined in claim 23 including the initial step of plating bright metal substrate coating onto said surfaces of said parts.

4,029,557

TREATMENT OF WATER CONTAINING CYANIDE

Wendell N. Christensen, Brigham City, and Larry W. Poulter, Ogden, both of Utah, assignors to Thiokol Corporation, Newtown, Pa.

Filed Oct. 15, 1975, Ser. No. 622,599
Int. Cl.² C02C *5/12*; **C02B** *1/82*
U.S. Cl. 204—149 **3 Claims**



1. The process for destroying cyanide in water containing a metal-cyanide compound, comprising the steps of:

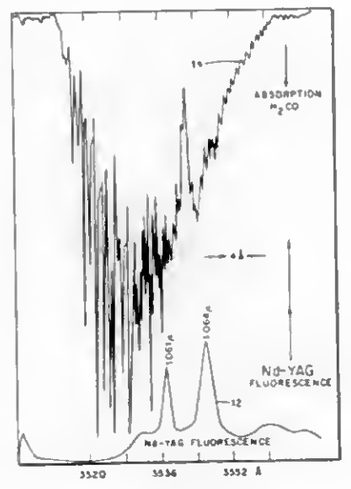
adding 1 to 6% by weight of sodium chloride to water;
passing the water through at least one energized electrolytic cell, wherein the sodium chloride and water are electrolyzed to produce chlorine and sodium hydroxide;
mixing this water with that containing the metal-cyanide compound;
allowing the chlorine and sodium hydroxide to react with the metalcyanide compound, wherein the cyanide is released in harmless gaseous products, the metal is precipitated, and the sodium chloride is reformed; and
recycling the resulting water containing the sodium chloride for repetition of the process.

4,029,558

ISOTOPE ENRICHMENT BY FREQUENCY-TRIPLED TEMPERATURE TUNED NEODYMIUM LASER PHOTOLYSIS OF FORMALDEHYDE

John B. Marling, Livermore, Calif., assignor to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Oct. 22, 1976, Ser. No. 734,840
Int. Cl.² B01J *1/10*
U.S. Cl. 204—158 R **11 Claims**



1. A method for separating isotopes of at least one of the elements carbon, hydrogen and oxygen by selective photo-predissociation of formaldehyde which comprises:

subjecting a gaseous formaldehyde isotope source material to laser radiation at a given wavelength in the range of from about 352 nanometers to about 355 nanometers which excites those molecules of formaldehyde containing a desired isotope without substantially exciting those molecules of formaldehyde containing an undesired isotope of the same element, the excited molecules thereby dissociating to form a product enriched in the desired isotope without substantial dissociation of unexcited molecules,
providing said laser radiation by means of a neodymium laser in a frequency-tripled configuration, said laser being tuned to said given wavelength by varying the temperature of the laser crystal, and
separating the dissociation product enriched in the desired isotope from the reaction system.

4,029,559

ION LASER ISOTOPE ENRICHMENT BY PHOTO-PREDISSOCIATION OF FORMALDEHYDE

John B. Marling, Livermore, Calif., assignor to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed June 17, 1976, Ser. No. 697,000
Int. Cl.² B01J *1/10*
U.S. Cl. 204—158 R **10 Claims**

1. A method for separating isotopes of at least one element selected from carbon, hydrogen and oxygen by selective photo-predissociation of formaldehyde which comprises:

subjecting a gaseous formaldehyde isotope source material to laser radiation at a predetermined wavelength selected from the range of about 3323.75 ± .025 A, the range of about 3323.71 ± .01 A, about 3250.3 A, and about 3454.26 A which excites those molecules of formaldehyde containing a desired isotope of said element without substantially exciting those molecules of formaldehyde containing an undesired isotope of the same element, the excited molecules thereby dissociating to form a product enriched in the desired isotope without substantial dissociation of unexcited molecules;
providing said laser radiation by means of a neon ion laser when said predetermined wavelength is in the range of about 3323.75 ± .025 A, by means of a neon-22 ion laser when said predetermined wavelength is in the range of about 3323.71 ± .01 A, by means of a cadmium ion laser when said predetermined wavelength is about 3250.3 A, and by means of a xenon ion laser when said predetermined wavelength is about 3454.26 A; and
separating the dissociation product enriched in the desired isotope from the reaction system.

4,029,560

PROCESS FOR PRODUCING α,α,α,α',α',α'-HEXACHLOROXYLENE

Shigeo Yoshinaka; Masaharu Doya; Seiiji Uchiyama, and Sadao Nozaki, all of Niigata, Japan, assignors to Mitsubishi Gas Chemical Company, Inc., Tokyo, Japan

Filed Mar. 29, 1976, Ser. No. 671,698
Claims priority, application Japan, Apr. 1, 1975, 50-39587
Int. Cl.² B01J *1/10*
U.S. Cl. 204—163 R **5 Claims**

1. A process for batchwise or continuous production of α,α,α,α',α',α'-hexachloroxylene by reacting a xylene compound selected from the group consisting of (i) xylene selected from m-xylene and p-xylene and (ii) compounds resulting from the partial chlorination of the side-chain methyl groups of the xylene (i), with chlorine under the irradiation of ultraviolet rays; said process comprising

1. a first-step chlorination reaction which is carried out in the presence of α,α,α,α',α',α'-hexachloroxylene as a solvent added at the initial stage of the reaction, and continued until a compound convertible to α,α,α,α',α',α'-hexachloroxylene by chlorination becomes substantially absent in the reaction mixture, and
2. a second-step chlorination reaction which is continued from the first-step chlorination and carried out to convert difficulty-separable by-products present in the reaction mixture to easily-separable compounds.

4,029,561

PHOTOCURABLE CATHODIC ELECTROCOATING

Vincent Daniel McGinniss, Valley City, Ohio, assignor to SCM Corporation, New York, N.Y.

Filed Jan. 22, 1976, Ser. No. 651,541
Int. Cl.² C25D *13/06, 13/10*
U.S. Cl. 204—181 **2 Claims**

1. In a process for electrodeposition of an electrocoating composition onto a cathode substrate disposed within an aqueous electrocoating bath, said electrocoating composition containing a polymer having pendant amine groups which are protonated with a proton donating acid and a crosslinking agent in an aqueous dispersion in said bath, said polymer being crosslinkable upon subsequent ultraviolet irradiation of said electrocoating on said cathode substrate, the improvement which comprises:

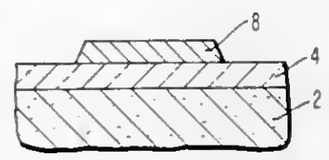
a. providing said electrocoating composition containing said polymer having at least about 5% pendant amine groups each amine group being attached to an alpha carbon relative to each said amine group of said polymer, said amine groups being protonated with said proton donating acid to render said polymer water dispersible in said bath, said electrocoating composition containing at least about 5% bis-maleimide crosslinking agent by weight of said polymer, and said electrocoating composition containing at least about 0.5% by weight of said polymer of an ultraviolet photosensitizer;
b. applying an electromotive potential through said bath to electrodeposit said polymer, said crosslinking agent, and said photosensitizer onto said cathode substrate to form an electrocoating, said pendant amine groups of said polymer becoming de-protonated thereby; and
c. irradiating said electrocoating on said cathode substrate with ultraviolet radiation to crosslink said polymer with said bis-maleimide by free radical addition polymerization with said alpha carbon to cure said electrocoating.

4,029,562

FORMING FEEDTHROUGH CONNECTIONS FOR MULTI-LEVEL INTERCONNECTIONS METALLURGY SYSTEMS

Bai-Cwo Feng, and John S. Lechaton, both of Wappingers Falls, N.Y., assignors to IBM Corporation, Armonk, N.Y.

Filed Apr. 29, 1976, Ser. No. 681,367
Int. Cl.² C23C *15/00*
U.S. Cl. 204—192 EC **6 Claims**



1. A method for forming connections between levels of conductive patterns comprising:

forming a first conductive pattern atop a substrate;
forming another pattern atop selected portions of said first conductive pattern, said other pattern including a first metal and an expendable material disposed on said first metal;
said expendable material being removable by an etchant which does not attack said metal or said substrate;
depositing an insulator atop said substrate and said patterns by RF sputtering at a bias which is sufficiently high to cause substantial reemission of said insulator, thereby covering the exposed substrate surfaces and said patterns, but leaving the side surfaces of said expendable material exposed;

etching said expendable material with said etchant, thereby removing said expendable material and the portion of the insulator disposed thereon.

2. A method as in claim 1 wherein said first metal is selected from the group consisting of aluminum, aluminum-copper alloys and aluminum-copper-silicon alloys.

3. A method as in claim 2 wherein said expendable material is selected from the group consisting of copper and chrome-copper-chrome composites; and

said etchant is nitric acid.

4,029,563

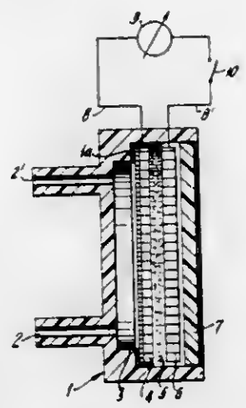
ELECTROCHEMICAL MEASURING CELL

Horst Binder, Karben-Petterweil; Reinhard Knödler, Hofheim; Alfons Köhling, Eschborn, and Gerd Sandstede, Frankfurt am Main, all of Germany, assignors to Dragerwerk Aktiengesellschaft, Germany

Filed Dec. 2, 1974, Ser. No. 529,007

Int. Cl.² G01N 27/46, 27/52

U.S. Cl. 204—195 R **3 Claims**



1. An electrochemical measuring cell for continuous measurement of the sulfur dioxide content of the air in emission and immission areas, comprising a cell having a test gas and cell chamber, a test gas connection for the passage of test gas into said test gas and cell chamber, a diffusion electrode serving as an anode and comprising a reversible, organic redox system located in said gas and test cell chamber, a cathode spaced from said anode and comprising an active mass having a redox potential higher than the redox potential of said anode, an immobilized electrolyte between said anode and said cathode, means connected between said anode and said cathode for measuring the short-circuit current therebetween; the redox system in the diffusion electrode having a quinoid structure and being present in a solid state.

4,029,564

HIGH SPEED PLATING DEVICE FOR RECTANGULAR SHEETS

Kazuhiro Higuchi, Hatano, and Junichi Tezuka, Isehara, both of Japan, assignors to Electroplating Engineers of Japan, Limited, Tokyo, Japan

Filed Mar. 26, 1976, Ser. No. 670,684

Int. Cl.² C25D 17/06

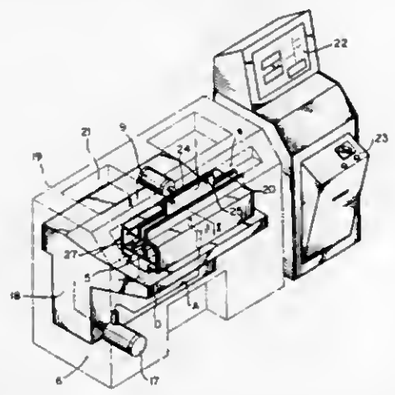
U.S. Cl. 204—224 R **8 Claims**

1. A plating device for plating a selected lengthwise portion of a sheet-like article, comprising:

masking means for masking portions on opposite sides of the article which are not to be plated, said masking means including a pair of opposed plates having masking sheets on the facing sides thereof, said plates having a length corresponding to the length of the article, and pressure cylinder means coacting with said plates for causing relative movement therebetween so that said article can be pressed between the plates whereby the masking sheets cover portions of the article which are not to be plated, said masking means leaving lengthwise portions located on opposite faces of the article exposed for plating;

jetting means for simultaneously and uniformly applying a plating solution to the exposed lengthwise portions of the article which are disposed on the opposite faces thereof, said jetting means including a pair of nozzle members which are spaced apart and are directed toward one another for permitting the article to be disposed therebetween, whereby each of the nozzle members jets the plating solution against the exposed lengthwise portion on one side of the article;

each nozzle member having a discharge opening means which is elongated in the lengthwise direction of the article and oriented to direct the discharged stream of



plating solution in a direction substantially perpendicular to the exposed lengthwise portion of the article so that the stream of plating solution, upon impacting against the exposed lengthwise portion of the article, divides substantially uniformly into substreams which flow outwardly in opposite directions over the exposed lengthwise portion of the article for effecting plating thereof;

anode means associated with each of said nozzle members, said anode means being positioned at the edge of said nozzle member so as to define said discharge opening means, said anode means being positioned along both edges of said discharge opening means and extending in the elongated direction thereof so as to extend in the lengthwise direction of the article; and

means for supplying plating solution to said jetting means.

4,029,565

ELECTROLYTIC APPARATUS

Werner Bender, Hofheim, Taunus; Dieter Bergner; Kurt Hannesen, both of Kelkheim, Taunus; Helmut Hund, Konigstein, Taunus, and Wilfried Schulte, Hofheim/Taunus, all of Germany, assignors to Hoeschst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Aug. 27, 1976, Ser. No. 718,341

Claims priority, application Germany, Aug. 29, 1975, 2538414; Mar. 11, 1976, 2610114

Int. Cl.² C25B 1/26, 9/00

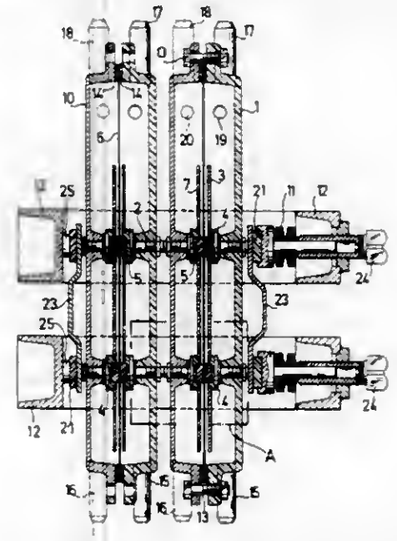
U.S. Cl. 204—256 **9 Claims**

1. Electrolytic apparatus for the production of chlorine from aqueous alkali metal chloride solution comprising at least one electrolytic cell consisting of a housing with equipment for the supply of the current for the electrolysis, for the supply of the starting products and for the discharge of the products of electrolysis, in which housing the anode and cathode are separated from each other by a separating wall, wherein

a. the housing is composed of two hemispherical shells,

b. the electrodes are connected with the hemispherical shells by conductive bolts projecting through the wall of the hemispherical shells and the end faces of the bolts are in contact with current supply means and means to clamp together the current supply means, the hemispherical shells, the electrodes and the separating wall, and

c. the separating wall is positioned between electrically



insulating spacers mounted in the extension of the bolts on the electrolytically active side of the electrodes and clamped between the edges of the hemispherical shells by packing elements.

4,029,566

ELECTRODE FOR ELECTROCHEMICAL PROCESSES AND METHOD OF PRODUCING THE SAME

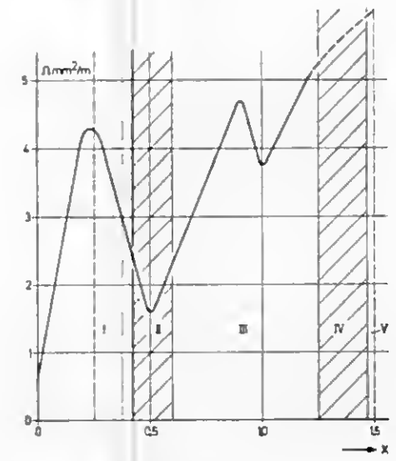
Franz Brandmair, Rain, Lech; Ottmar Rubisch, Meitingen near Augsburg, and Dietmar Hönig, Augshurg, all of Germany, assignors to Sigri Elektrographit GmbH, Meitingen near Augsburg, Germany

Filed Jan. 15, 1975, Ser. No. 541,348

Claims priority, application Germany, Feb. 2, 1974, 2405010

Int. Cl.² C25B 11/10

U.S. Cl. 204—290 F **9 Claims**



1. Chlorine resistant sintered electrode for aqueous electrolysis comprising a base formed of passivatable material, and a covering layer of activating substance at least partly covering said base, the material of said base consisting fo titanium oxide TiO_x, wherein x is 0.25 to 1.50, said material of said base having been sintered by heating in an inert gas atmosphere to a temperature of from 1200° C to 1400° C.

4,029,567

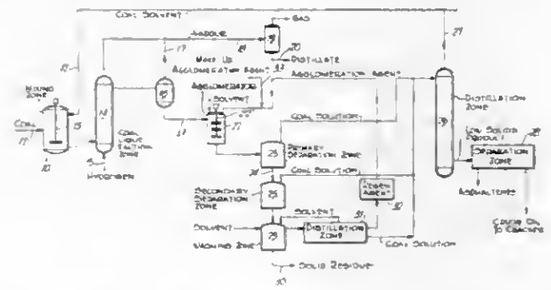
SOLIDS RECOVERY FROM COAL LIQUEFACTION SLURRY

Joseph Redmond Farnand, and Ira Edwin Puddington, both of Ottawa, Canada, assignors to Canadian Patents and Development Limited, Ottawa, Canada

Filed Apr. 20, 1976, Ser. No. 678,484

Int. Cl.² C10G 1/04

U.S. Cl. 208—8 **12 Claims**



1. In a coal liquefaction process which employs a coal liquefaction solvent wherein a product is recovered which contains a solution of coal liquefaction products in said liquefaction solvent as a first component and finely divided undissolved solids as a second component, the improvement for separating said second component from said first component by agglomeration while retaining substantially all asphaltenes contained in said product in said first component which comprises:

a. agitating said product, in an agglomeration zone, with

i. a hydrophilic agglomeration agent selected from the group comprising short chain organic compounds containing 2–8 carbon atoms and two or more functional groups selected from OH, COOH, C=O, NH_2, NH, N, ONH_4 and SO_3, and mixtures thereof, in the presence of

ii. an immiscibilizing agent selected from a polyvinyl alcohol and an aromatic solvent which renders said agglomeration agent immiscible in said solution, while maintaining the temperature and pressure sufficiently high to keep the mixture fluid, so as to effect agglomeration of said second component;

b. separating at least a major portion of said first component from agglomerated said second component; and

c. recovering said agglomeration agent and entrained said first component from said agglomerated second component.

4,029,568

METHOD OF RECOVERY OF OIL AND BITUMEN FROM OIL-SANDS AND OIL SHALE

Tobe A. Pittman, Centerville, and Jack L. Woods, Ogden, both of Utah, assignors to Minerals Research Corporation, Ogden, Utah

Continuation-in-part of Ser. No. 439,441, Feb. 4, 1974, abandoned. This application Sept. 26, 1975, Ser. No. 617,045

Int. Cl.² C10G 1/04

U.S. Cl. 208—11 LE **6 Claims**

1. A process for recovering bitumenous organic matter from tar sands, comprising the steps of supplying a layer of crushed ore containing tar sands on a perforate support, spraying such ore with a bitumen solvent from a class consisting of methylchloroform and chloroform, said spraying step being conducted at a pressure of from 1 to 100 psi to recover bitumen therefrom beneath said perforate support, whereby to form a solvent-bitumen solution which is essentially free of water, collecting said solution, vaporizing said solvent of said solution to leave a bitumen residue as a usable product, and condensing the so vaporized solvent for re-use in said spraying step.

4,029,569

PROCESS FOR RECLAIMING SPENT MOTOR OIL

Herbert D. Ivey, Jr., Pasadena, Calif., assignor to Lubrication Company of America, Los Angeles, Calif.

Filed Sept. 16, 1975, Ser. No. 613,932
Int. Cl.² C10M 11/00
U.S. Cl. 208—180 10 Claims

1. A process for reclaiming spent motor oil comprising:
a. heating said oil for a time sufficient to precipitate a substantial portion of the suspended solids;
b. separating said solids;
c. contacting said oil with concentrated sulfuric acid in an amount effective to substantially complete the precipitation of suspended solids without destroying viscosity index improvers in the oil;
d. separating said solids; and
e. treating said oil with an organic amine to neutralize the petroleum sulfonic acids resulting from the treatment with sulfuric acid, said amine being selected to form an oil soluble amino-sulfonate.

4,029,570

PROCESS FOR RECOVERING CRUDE OIL FROM AN UNDERGROUND RESERVOIR

Charles L. Coffman, Wichita, Kans.; Glen F. Kellerhals, Tulsa, Okla.; Jack Newcombe, Freehold, and Shirley H. Roth, Highland Park, both of N.J., assignors to Cities Service Company, Tulsa, Okla.

Filed Mar. 29, 1976, Ser. No. 671,187
Int. Cl.² C10G 33/00
U.S. Cl. 208—188 17 Claims

1. In a process for recovering crude oil from an underground reservoir wherein an oil-in-water emulsion of crude oil and water is recovered from the reservoir through a well therein, the method of breaking said emulsion for separation of the crude oil which consists essentially of mixing a naturally occurring brine with said emulsion in an amount sufficient to break the emulsion, agitating the mixture, and separating oil from the resulting broken emulsion.

4,029,571

METHOD OF REMOVING CONTAMINANT FROM HYDROCARBONACEOUS FLUID

Daniel J. Curtin, Plano, Tex., assignor to Atlantic Richfield Company, Dallas, Tex.

Filed Feb. 25, 1975, Ser. No. 552,946
Int. Cl.² C10G 23/00
U.S. Cl. 208—251 H 9 Claims

1. A method for removing a contaminant comprising at least one of arsenic and selenium from a synthetic hydrocarbonaceous fluid feed stream obtained from oil shale comprising the steps of
noncatalytically heat treating said feed stream at a temperature of at least about 600° F and at a pressure such that a substantial portion of said feed is maintained in a liquid phase for a period of time sufficient to form a precipitate; and
thereafter separating at least a portion of said precipitate from the thus treated synthetic hydrocarbonaceous fluid.

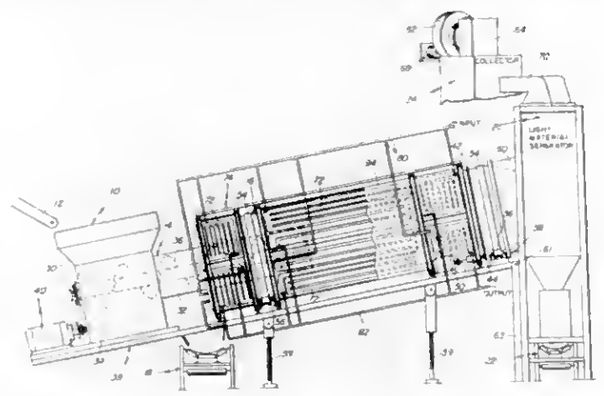
4,029,572

AIR DRUM WITH DRYING MEANS

Michael J. Theodore, Weston, Mass.; Malcolm M. Paterson, Atkinson, N.H., and William J. Paxson, Cedar Rapids, Iowa, assignors to Raytheon Company, Lexington, Mass.

Filed Oct. 3, 1975, Ser. No. 619,414
Int. Cl.² B07B 4/06
U.S. Cl. 209—11 2 Claims

1. An air classifier system comprising a drum, means for depositing mixed materials to be separated into the drum, means for directing a flow of air at relatively high velocity into one end and through the drum to entrain and carry light materials out the opposite end of the drum, means for removing moisture from the materials in the drum comprising plate coils disposed in at least partially encircling spaced relation to the outer surface of the drum for heating same, means for supplying heat-producing fluid to said plate coils for circulation therethrough, and means for removing fluid from the coil



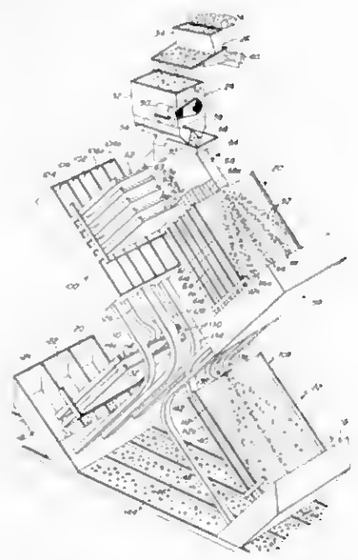
after circulation, and heat reflecting means covering the outer side of said plate coils for reflecting heat toward the drum, the outer surface of the drum being provided in areas opposite said plate coils with projections for creating turbulence in the air in the space between the drum and coils.

4,029,573

WASTE SEGREGATING APPARATUS

Michael J. Theodore, Weston, and John S. DiMercurio, Medford, both of Mass., assignors to Raytheon Company, Lexington, Mass.

Filed Mar. 17, 1975, Ser. No. 559,342
Int. Cl.² B03C 1/08
U.S. Cl. 209—212 14 Claims



1. Apparatus for separating conductive nonferromagnetic metals from a supply of a commingled nonferromagnetic materials comprising a first sorting stage including means for separating said supply into a first portion comprising nonconductive materials, a second portion comprising conductive metals, such as aluminum, having relatively high conductivity, and a third portion comprising a streamlet of primarily conductive materials having lower conductivity than said second portion, said first stage comprising a plurality of inclined first ramps each of which has means at its upper end for receiving a respective stream of commingled nonferromagnetic materials, said first ramps each having steady-state magnetic means for separating its respective stream into said first, second, and third portions, and a second stage including at least one inclined second ramp positioned to receive said streamlets from said first ramps, said second ramp including permanent magnet means disposed to establish an alternating series of oppositely directed magnetic fields at an oblique angle to said streamlets for segregating therefrom conductive metals having relatively high conductivity which may be included therein.

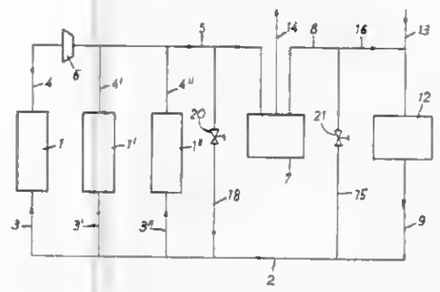
PROCESS AND APPARATUS FOR THE PURIFICATION OF ORGANICALLY CONTAMINATED SEWAGE

Hans Reimann, Pullach, Germany, assignor to Linde Aktiengesellschaft, Wiesbaden, Germany

Filed Sept. 18, 1972, Ser. No. 289,850
Claims priority, application Germany, Sept. 16, 1971, 2146403
Int. Cl.² C02C 1/06
U.S. Cl. 210—3 15 Claims



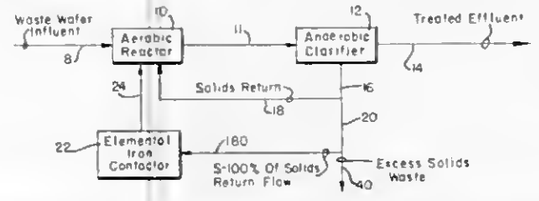
1. In an activated sludge process wherein sewage is oxygenated with oxygen or oxygen-enriched air containing at least 40% oxygen in an aeration tank containing a sewage-activated sludge mixture, the improvement which comprises:
a. collecting at least a portion of a gaseous mixture exiting from the aeration tank said gaseous mixture containing unconsumed oxygen and gaseous metabolic products, primarily CO_2;
b. separating at least a major portion of said CO_2 present in said gaseous metabolic products from said gaseous mixture by condensation, adsorption or scrubbing to form a purified gaseous mixture containing oxygen; and
c. recycling the purified gaseous mixture containing oxygen to an inlet of the aeration tank to further oxygenate the sewage-activated sludge mixture therein, and adding makeup oxygen in an amount corresponding to the oxygen consumption of the sewage-activated sludge mixture to maintain the at least 40% oxygen concentration in the aeration tank.

4,029,575

PHOSPHORUS REMOVAL FROM WASTE WATER

Michael J. Bykowski, West Bend, and Lloyd Ewing, Bay Side, both of Wis., assignors to Ewing Engineering Company, Milwaukee, Wis.

Filed June 9, 1972, Ser. No. 263,740
Int. Cl.² C02C 5/10
U.S. Cl. 210—16 16 Claims



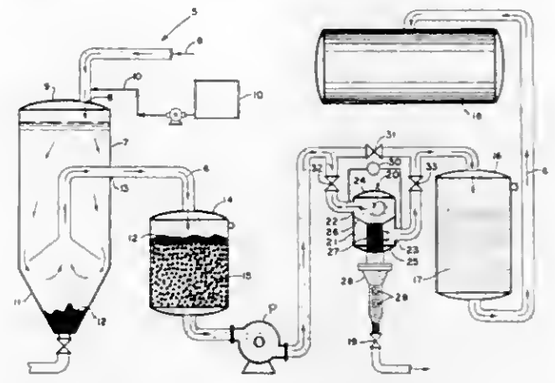
1. A process for the treatment of waste water comprising dissolved phosphorous compounds, including mixing the aqueous reaction products of elemental iron with waste water, exposing the resulting mixture alternately to aerobic and anaerobic conditions in either sequence, and clarifying the resulting liquid-solid suspension to produce a fraction from which has been removed suspended solids, including insolubilized phosphorous compounds.

4,029,576

SYSTEM FOR SOFTENING WATER

Ronald E. Shivers, Canton, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio

Filed Feb. 23, 1976, Ser. No. 660,303
Int. Cl.² B01J 1/04
U.S. Cl. 210—27 13 Claims



6. A method of reducing the total hardness of water expressed in parts per million of calcium carbonate, comprising:
a. reacting water with lime and soda ash in a sedimentation tank to precipitate calcium carbonate from the water, as sludge, thereby reducing the hardness of the water;
b. then passing the water, with the reduced hardness, through a bed of coal for filtering out sludge carried by water from the sedimentation tank;
c. then passing the water, filtered through the bed of coal, through a separator for removing particles of coal carried by water from the bed of coal, the separator comprising:
1. a housing which is impervious to water and which has a top and bottom when disposed vertically;
2. an inlet port through which coal-laden water enters the housing adjacent the top thereof;
3. an outlet port through which coal-free water exits the housing adjacent the bottom thereof;
4. A stationary cage disposed within the housing in spaced relation from the inlet and outlet ports, the cage having an opening and formed of wire screen having a mesh sufficiently small to contain particles of coal within the cage; and
5. means disposed within the housing for directing coal-laden water from the inlet port into the cage through the opening and through the wire screen and into the space between the cage and outlet port for exit through the outlet port; and
d. then passing the water, from the separator, through a resinous bed of sodium zeolite to further reduce the total hardness of the water.

4,029,577

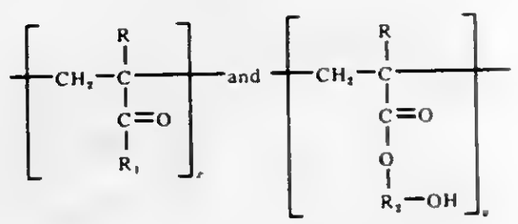
POLYMERS FOR USE IN WATER TREATMENT

Irene T. Godlewski, Moorestown, N.J.; Joseph J. Schuck, Holland, and Bruce L. Libutti, Bethayres, both of Pa., assignors to Betz Laboratories, Inc., Trevose, Pa.

Filed Nov. 17, 1975, Ser. No. 632,549
Int. Cl.² C02B 5/06
U.S. Cl. 210—58 27 Claims

1. A method of controlling the deposition of scale imparting precipitates on the structural parts of a system exposed to an aqueous medium containing scale imparting precipitates under deposit forming conditions; said scale imparting precip-

itates being selected from the group consisting of calcium phosphate, magnesium phosphate, calcium silicate, magnesium silicate, iron oxide and mixtures thereof, which method comprises adding to said aqueous medium an effective amount for the purpose of a water soluble polymer comprising moieties derived from an acrylic acid or water soluble salt thereof and moieties of an hydroxylated lower alkyl acrylate, wherein the moieties of the polymer have the following formulas:



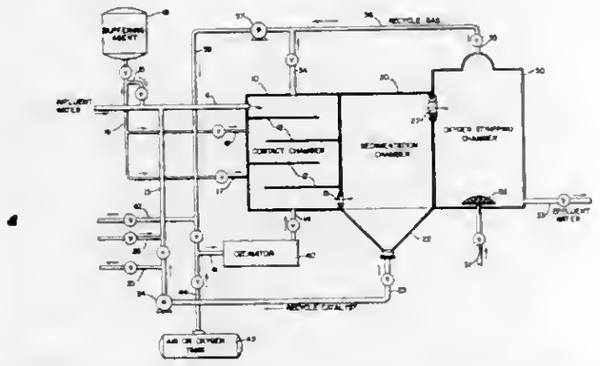
wherein R is hydrogen or a lower alkyl of from 1 to 3 carbon atoms; R_1 is OH, OM or NH_2 where M is a water soluble cation; R_2 is a lower alkyl of from about 2 to 6 carbon atoms and the mole ratio of x:y is 34:1 to 1:4.

4,029,578

CATALYTIC PROCESS FOR OZONATION OF WATER CONTAINING ORGANIC CONTAMINANTS

Amos Turk, Danbury, Conn., assignor to Environmental Research and Applications, Inc., Briarcliff Manor, N.Y.

Filed Sept. 4, 1975, Ser. No. 610,324
Int. Cl.² C02B *1/38*; **C02C** *5/04*
U.S. Cl. 210—63 Z **9 Claims**



1. In a process for the ozonation of water, wherein water containing organic material is contacted, at ambient temperature and pressure and without heating, with ozone in the presence of an insoluble ozonation catalyst suspended in said water; the improvement which comprises, employing as said ozonation catalyst a mixed heterogeneous catalyst consisting essentially of compounds selected from the group consisting of insoluble oxides and salts of at least two metals selected from the group consisting of copper, cadmium and the Group VIII metals.

4,029,579

METHOD AND DEVICE FOR DEWATERING OF SUSPENSIONS

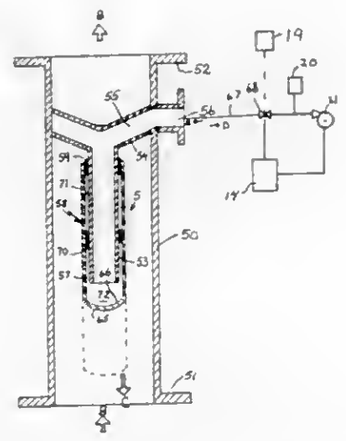
Finn Jacobsen, and Lennart Gustavsson, both of Karlstad, Sweden, assignors to Kamyr Aktiebolag, Karlstad, Sweden

Filed Apr. 13, 1976, Ser. No. 676,659
Claims priority, application Sweden, Apr. 15, 1975, 7504310
Int. Cl.² B01D *33/00*, *35/16*; **D21C** *9/18*
U.S. Cl. 210—77 **14 Claims**

10. A method of dewatering a suspension of comminuted fiber material and a liquid utilizing a generally circular container, a hydraulic piston mounted concentrically in the container and having screen means for separating liquid from the suspension and being movable in either a first or a second direction, said method comprising the steps of

passing a suspension to be dewatered through said container in a first direction,

separating out a portion of the liquid from said suspension with said screen means and removing said separated liquid from said container,



moving said piston in said first direction under the pressure of liquid of said suspension while separating out a portion of the liquid from said suspension, and

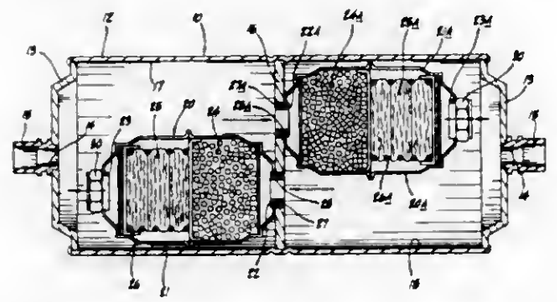
substantially terminating separating out of a portion of the liquid from said suspension while moving said piston in a second direction opposite to said first direction under the influence of liquid which has been separated from said suspension, to prevent clogging of said screen means.

4,029,580

BIDIRECTIONAL FLOW FILTER-DRIER

Harold T. Lange, St. Louis, Mo., assignor to Sporlan Valve Company, St. Louis, Mo.

Filed Oct. 5, 1976, Ser. No. 729,670
Int. Cl.² B01D *35/12*
U.S. Cl. 210—136 **10 Claims**



1. A filter-drier unit for heat pump systems, comprising:

a. a shell provided with flow ports,

b. a partition in the shell providing separate compartments, each of which operatively connects to a flow port,

c. a filter-drier means located in each compartment, each filter-drier means including an inlet and an outlet,

d. conduit means connecting the inlet of each filter-drier means with the compartment other than the one in which the filter-drier means is located, and

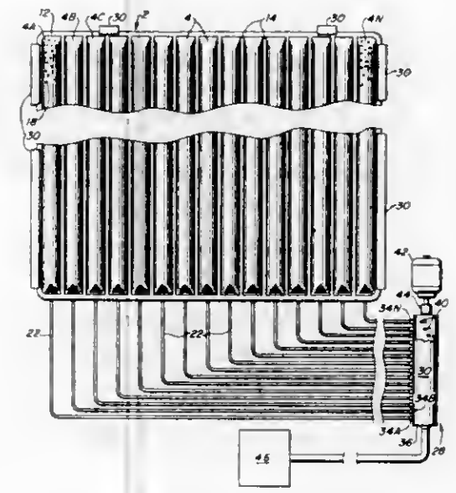
e. a check valve means connected to the outlet of each filter-drier means to enable flow into the compartment in which the filter-drier means is located and to preclude backflow.

4,029,581

AERATING SYSTEM

Roy L. Clough, Jr., Concord, N.H., and John F. Snow, Warwick, R.I., assignors to Xodar Corporation, Warwick, R.I.

Filed Dec. 26, 1974, Ser. No. 536,595
Int. Cl.² B01F *3/04*
U.S. Cl. 210—220 **7 Claims**



1. Apparatus for agitating and aerating a liquid waste suspension containing suspended organic matter, said apparatus comprising in combination:

a holder adopted to contain said liquid suspension, said holder having lateral boundaries and a bottom.

agitating and aerating means disposed along said bottom, said agitating and aerating means covering the bottom of said holder, said agitating and aerating means comprising a bag having upper and bottom sheets, each of said sheets being formed of water-impermeable material, said upper sheet being flexible, and somewhat larger in size than said bottom sheet, said sheets being sealed to each other along their entire outer edges and also at spaced apart regions so as to define a plurality of closed inflatable cells disposed in side by side relation, and a plurality of holes in said upper sheet for releasing gas from within said cells at restricted rates so as to form small bubbles that rise in said liquid suspension and make intimate contact with and oxidize said suspended organic matter;

means disposed along the periphery of said bag for anchoring said bag to said bottom so that said bottom sheet overlies and engages and is prevented from moving with said respect to said bottom; and

gas delivery means coupled to said cells for supplying gas to said cells so that sequentially and repetitively said cells are (a) inflated by inflow of gas from said gas delivery means and (b) deflated by outflow of gas via said holes, and a wave of agitation is produced in the suspension by the sequential and repetitive inflation and deflation of the cells.

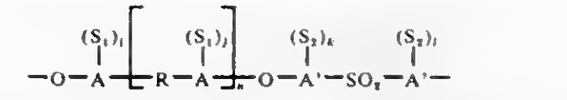
4,029,582

POLY(ARYLETHER-SULFONE) SEMIPERMEABLE MEMBRANE COMPRISING SUBSTITUTED HALOMETHYL AND/OR QUATERNARY NITROGEN GROUPS

Kiyoshi Ishii, and Kozi Sato, both of Saitama, Japan, assignors to Daicel, Ltd., Osaka, Japan

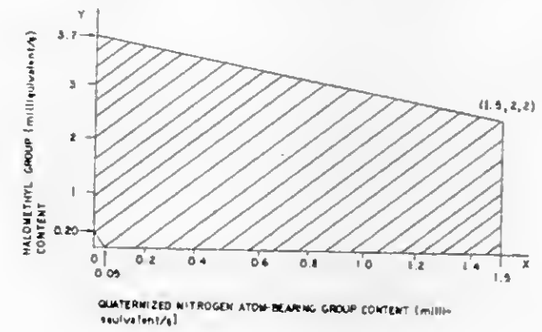
Filed July 7, 1975, Ser. No. 593,227
Claims priority, application Japan, July 11, 1974, 49-79417
Int. Cl.² B01D *39/00*, *39/14*
U.S. Cl. 210—500 M **15 Claims**

1. A semipermeable membrane made of a modified poly (arylether-sulfone) polymer consisting essentially of repeating units of the formula



(1)

wherein A and A', which are the same or different, are aromatic hydrocarbon groups having from 6 to 14 carbon atoms in which hydrogen atoms on said aromatic groups are substituted by halomethyl groups and/or quaternary nitrogen atom-bearing groups, the degree of substitution



of the halomethyl groups and the quaternary nitrogen atom-bearing groups in said polymer being within the hatched pentagonal area of FIG. 1 of the attached drawings, said halomethyl group having the formula $-CH_2X$ wherein X is halogen, said quaternary nitrogen atom-bearing group having the formula

wherein R_1 and R_2, which can be the same or different, are alkyls having one to 4 carbon atoms, R_3 is alkyl having one to 20 carbon atoms, T is alkyl having one to 4 carbon atoms, *m* is zero or an integer of one to 5 and X_1 is hydrogen or halogen,

and wherein S_1 and S_2, which are the same or different, are substituent groups which are inert to halomethylation and quaternization reactions, the suffixes *i*, *j*, *k*, *l*, which are the same or different, are zero or an integer of from one to 4, and at least one of those suffixes in less than 4, *n* is zero or one, and R is a valence bond, —O— or a bivalent organic hydrocarbon group.

2. A method for producing a semipermeable membrane as set forth in claim 1 which comprises

1. casting on a surface a film of a solution consisting essentially of

A. a polymer consisting essentially of repeating units of the formula (1) and

B. an organic solvent capable of dissolving said polymer or a mixture of said solvents, or a multicomponent organic solvent composition comprising one or more of said solvents and compounds which themselves are non-solvents for said polymer and are effective to dissolve said polymer only when mixed with said solvents;

or a solution comprising (A), (B), and

C. a compound having a molecular weight below 500 soluble in said solvents and said non-solvents for the polymer (A) which are compatible to said solvents;

2. evaporating a portion of said solvent from said solution; and

3. removing the remainder of said solvent, or said solvent and said compound, by immersing the resulting film of said solution in a non-solvent coagulating bath compris-

ing a non-solvent for the polymer (A) and in which said solvents, or said solvents and said compounds are miscible or soluble.

4,029,583

CHROMATOGRAPHIC SUPPORTS AND METHODS AND APPARATUS FOR PREPARING THE SAME

Shung Ho Chang, and Frederick E. Regnier, both of West Lafayette, Ind., assignors to Purdue Research Foundation, West Lafayette, Ind.

Filed Feb. 28, 1975, Ser. No. 554,071
Int. Cl.² B01D *39/00, 39/14*
U.S. Cl. 210—502 **3 Claims**

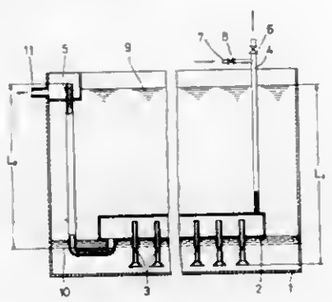
1. A chromatographic support, comprising:
an inorganic support matrix having a surface portion;
a stationary phase for partitioning solutes, said stationary phase being a glycidyl ether selected from the group consisting of methanol, ethanol, propanol, hexanol, tetradecanol, phenol, and p-nitrophenol, a nucleophilic functional group, and a leaving group; and
a silane coupling agent having one group for bonding to said surface portion of said support matrix and a second group for bonding to the stationary phase.

4,029,584

PNEUMATIC SLUDGE DISCHARGING SYSTEM

Tadao Takemoto, No. 2-2, 3-chome, Shimezu, Itami, Japan

Filed Oct. 26, 1976, Ser. No. 735,408
Claims priority, application Japan, Mar. 23, 1976, 51-33020
Int. Cl.² B01D *17/00*
U.S. Cl. 210—532 R **1 Claim**



1. A system for discharging sludge from a settling tank, said system comprising:
a sludge collecting pipe mounted in the tank in a horizontal position and having its opposite ends closed,
a plurality of branch pipes mounted on said sludge collecting pipe to extend downwardly therefrom for collecting sludge therethrough into said sludge collecting pipe,
said branch pipes having their top end projecting into said sludge collecting pipe near the top wall thereof,
an air supply pipe connected to said sludge collecting pipe to extend upwardly therefrom until it comes above the surface of a liquid to be treated in the tank,
said air supply pipe being open to the outside air at top end thereof through an exhaust valve and being connected to a source of compressed air at a position below said exhaust valve, and
a sludge discharge pipe connected to said sludge collecting pipe to extend downwardly and then upwardly until its top end comes slightly above the surface of the liquid to be treated,
said sludge discharge pipe having its lowermost portion disposed above the bottom end of said branch pipes, whereby the supply of compressed air causes the sludge to be discharged out of said sludge collecting pipe through said sludge discharge pipe.

4,029,585

AQUEOUS DISPERSIONS OF PERFLUOROALKYL ESTERS FOR TREATING TEXTILES

Robert Harold Dettre, Wilmington, and Edward James Greenwood, Newark, both of Del., assignors to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Division of Ser. No. 382,843, July 26, 1975, Pat. No. 3,923,715. This application Aug. 7, 1975, Ser. No. 602,902
Int. Cl.² D06M *13/16, 13/20*
U.S. Cl. 252—8.6 **2 Claims**

1. An aqueous dispersion of a composition consisting essentially of a perfluoroalkyl ester of a fluorinated alcohol having the formula $C_nF_{2n+1}(CH_2)_mOH$, wherein n is 6 to 14 and m is 2, and citric acid, the ester being volatile at about 200° C to 300° C, the composition forming up to about 60% of the total weight of the dispersion.

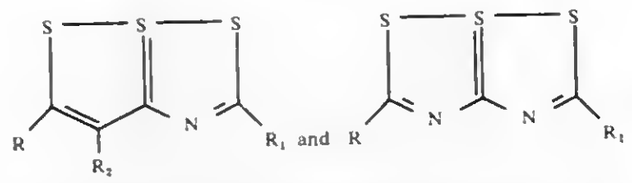
4,029,586

LUBRICATING COMPOSITIONS INHIBITED AGAINST OXIDATION BY ADDITION THERETO OF 3-AZO-6A-THIO-THIOPHTHENES OR 3,4-DIAZO-6A-THIO-THIOPHTHENES

Enzo Rossi; Silvano Fattori, both nI San Donato Milanese, and Luigi Imparato, Milan, all nI Italy, assignors to Snam Progetti, S.p.A., Milan, Italy

Filed Dec. 18, 1974, Ser. No. 533,955
Claims priority, application Italy, Dec. 20, 1973, 54483/73
Int. Cl.² C10M *1/38*
U.S. Cl. 252—47.5 **7 Claims**

1. A lubricating composition inhibited against oxidation, comprising a mineral or synthetic oil having dissolved therein an antioxidant amount of an additive selected from the group consisting of the 3-azo-6a-thio-thiophthenes and 3,4-diazo-6a-thio-thiophthenes, represented by the general formulae;



wherein R, R_1 and R_2, the same or different, represent a member of the group consisting of hydrogen, alkyl, cycloalkyl, aryl, alkylaryl, arylalkyl, and aminoaryl and p-methoxy-anilino.

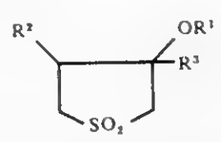
4,029,587

LUBRICANTS AND FUNCTIONAL FLUIDS CONTAINING SUBSTITUTED SULFOLANES AS SEAL SWELLING AGENTS

Frederick William Koch, Willoughby Hills, Ohio, assignor to The Lubrizol Corporation, Cleveland, Ohio

Filed June 23, 1975, Ser. No. 589,309
Int. Cl.² C10M *1/38*
U.S. Cl. 252—48.2 **14 Claims**

1. A composition comprising a major amount of an oleaginous liquid of lubricating viscosity and a minor amount, effective to cause swelling of seals in machinery, of a substituted sulfolane of the formula



wherein R^1 is a hydrocarbon radical having at least about 4 carbon atoms and each of R^2 and R^3 is hydrogen or a lower alkyl radical.

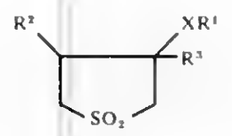
4,029,588

SUBSTITUTED SULFOLANES AS SEAL SWELLING AGENTS

Frederick William Koch, Willoughby Hills, Ohio, assignor to The Lubrizol Corporation, Cleveland, Ohio

Filed June 23, 1975, Ser. No. 589,310
Int. Cl.² C10M *1/38*
U.S. Cl. 252—48.2 **10 Claims**

1. A method of causing swelling of seals in machinery which comprises contacting said seals with a composition comprising a major amount of an oleaginous liquid of lubricating viscosity and, dissolved or stably dispersed therein, a minor amount, effective to swell said seals, of a substituted sulfolane of the formula



wherein R^1 is a hydrocarbon radical having at least about 4 carbon atoms, each of R^2 and R^3 is hydrogen or a lower alkyl radical, and X is oxygen or sulfur.

4,029,589

PROCESS OF INHIBITING CORROSION AND/OR SWEETENING HYDROCARBONS

J. Irvine Knepper, Manchester; Richard L. Godar, and James W. Propst, both of St. Louis, all of Mo., assignors to Petrolite Corporation, St. Louis, Mo.

Filed Aug. 6, 1974, Ser. No. 495,233
Int. Cl.² C10M *1/32;* **C10L** *1/22*
U.S. Cl. 252—51 **24 Claims**

1. A process of inhibiting the corrosion of a metal by a liquid hydrocarbon product coming in contact therewith, said liquid hydrocarbon product, prior to the herein recited treatment being incapable of passing the Copper Strip Tarnish Test ASTM D-130, which comprises treating said liquid hydrocarbon product by adding thereto an additive selected from the group consisting of iodine, bromine, complexes of iodine and complexes of bromine, said additive being employed in an amount sufficient to enable said liquid hydrocarbon product to pass said Copper Strip Tarnish Test.

4,029,590

DEXTRIN CARBOXYLATES AND THEIR USE AS DETERGENT BUILDERS

Joseph H. Finley, Metuchen, N.J., assignor to FMC Corporation, Philadelphia, Pa.

Division of Ser. No. 390,524, Aug. 22, 1973, Pat. No. 3,941,771. This application Oct. 6, 1975, Ser. No. 619,802
Int. Cl.² C11D *3/22*
U.S. Cl. 252—89 R **6 Claims**

1. A detergent composition consisting essentially of
a. at least one detergent surface active agent selected from the group consisting of anionic, nonionic, zwitterionic and ampholytic agents, and
b. an organic biodegradable detergent builder comprising a dextrinized starch of about 20 to about 100 anhydroglucose units wherein from about 2.2 to about 2.8 average OH groups per anhydroglucose unit are esterified through one of the carboxyls of a non-aromatic polycarboxylic acid of 2–4 carboxyls containing 2 to 10 carbon atoms, and the water-soluble salts thereof.

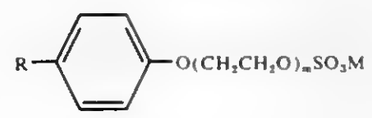
4,029,591

LIQUID DETERSIVE BLEACHING COMPOSITION

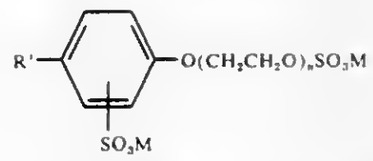
Kazuo Ohbu, Tokyo; Yuichi Takada, Kamagaya, and Shigemi Nakamura, Tokyo, all of Japan, assignors to Lion Fat & Oil Co., Ltd., Tokyo, Japan

Filed Sept. 22, 1975, Ser. No. 615,393
Claims priority, application Japan, Sept. 27, 1974, 49-110591
Int. Cl.² C11D *3/395, 7/54*
U.S. Cl. 252—95 **5 Claims**

1. A liquid detersive bleaching composition, consisting essentially of:
a. from 0.3 to 7 weight percent of a substance having the formula



wherein R is alkyl having 5 to 15 carbon atoms, *m* is an integer from 3 to 15, and M is Na or K;
b. from 0.1 to 5 weight percent of a substance having the formula



wherein R′ is alkyl having 5 to 15 carbon atoms, *n* is an integer from 3 to 15, and M is Na or K,
the sum of component a. plus component b. being from more than 0.5 weight percent to less than 10 weight percent, and the molar ratio of a./b. being in the range of from 20/80 to 85/15;
c. from 3 to 10 weight percent, calculated as available chlorine, of sodium hypochlorite;
d. from 0.5 to 3 weight percent of caustic alkali;
e. up to less than 10 weight percent of sodium benzenesulfonate; and
f. the balance is essentially water.

4,029,592

POLYBUTENE COMPOSITION AND USE THEREOF

Imre Puskas, Glen Ellyn, and John A. Cengel, Wheaton, both of Ill., assignors to Standard Oil Company (Indiana), Chicago, Ill.

Division of Ser. No. 358,915, May 10, 1973, Pat. No. 3,960,900. This application Dec. 5, 1975, Ser. No. 638,183
Int. Cl.² C07D *307/36*
U.S. Cl. 252—182 **7 Claims**

1. A polybutene composition comprising a viscous polybutene having a $\overline{M}_n$ in the range of about 300 to about 3000 and based on the weight of said viscous polybutene from 5 to 200 ppm of a 40° to 225° C boiling bromo- or chlorobromo-substituted aliphatic hydrocarbon as additive.

4,029,593

MIXED POLYOLS

Dietmar Schäpel, Cologne, and Ulrich von Gizycki, Opladen, both of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Germany

Filed Aug. 12, 1974, Ser. No. 496,617
Claims priority, application Germany, Aug. 16, 1973, 2341294
Int. Cl.² C09K *3/00*
U.S. Cl. 252—182 **6 Claims**

1. A polyol mixture containing:

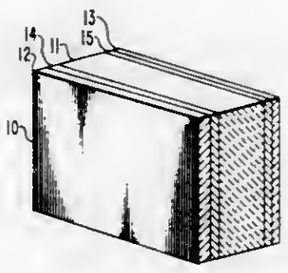
a. at least two polyols which are normally incompatible with each other, and
b. about 0.05 to about 5 percent by weight, based on component (a), of an inert surface-active inorganic material having a specific surface area of 10 to 800 m^2/g, which inorganic material is selected from the group consisting of activated charcoal, asbestos, a surface-active silicic acid and a zeolite.

4,029,594

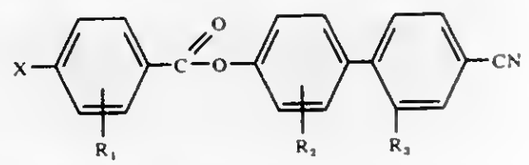
NOVEL LIQUID CRYSTAL COMPOUNDS AND ELECTRO-OPTIC DEVICES INCORPORATING THEM

Dragan Milan Gavrilovic, Cranbury, and Daniel Louis Ross, Princeton, both of N.J., assignors to RCA Corporation, New York, N.Y.

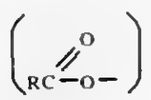
Filed June 17, 1976, Ser. No. 696,905
Int. Cl.² C09K *3/34*; **G02F** *1/13*; **C07C** *121/64, 69/96*
U.S. Cl. 252—299 **9 Claims**



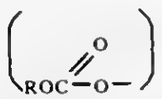
3. A liquid crystal compound having the formula



wherein X can be alkyl (R–), alkoxy (-OR), acyloxy



or alkylcarbonato



group wherein R is an alkyl group containing 1–10 carbon atoms and R_1–R_3 can be hydrogen, methyl or halogen with the proviso that at least one and no more than two of R_1–R_3 substituents other than hydrogen.

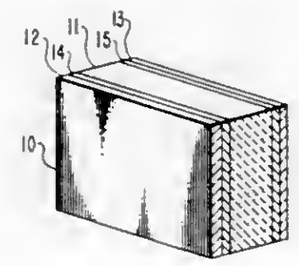
4,029,595

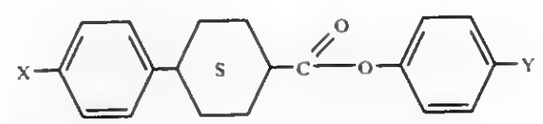
NOVEL LIQUID CRYSTAL COMPOUNDS AND ELECTRO-OPTIC DEVICES INCORPORATING THEM

Daniel Louis Ross, Princeton, and Dragan Milan Gavrilovic, Cranbury, both of N.J., assignors to RCA Corporation, New York, N.Y.

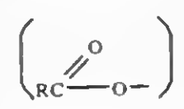
Filed Sept. 17, 1976, Ser. No. 724,221
Int. Cl.² C09K *3/34*; **G02F** *1/13*; **C07C** *121/46, 121/75, 79/44, 79/46*
U.S. Cl. 252—299 **8 Claims**

1. An electro-optic cell comprising a liquid crystal layer between two electrodes wherein said liquid crystal includes a compound of the formula

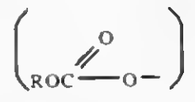




wherein X can be an alkoxy (RO—), acyloxy



or alkylcarbonato



group wherein R is an alkyl group having 1–10 carbon atoms and Y is a nitro or cyano group.

4,029,596

DE-EMULSIFIER FOR BREAKING PETROLEUM EMULSIONS

Hans-Ferdi Flnk, Essen-Ruttenscheid; Götz Koerner, Essen, and Gerd Rossmy, Essen-Werden, all of Germany, assignors to Th. Goldschmidt AG, Essen, Germany

Continuation-in-part of Ser. No. 471,585, May 20, 1974, abandoned. This application Dec. 23, 1974, Ser. No. 535,841
Claims priority, application Switzerland, Nov. 8, 1973, 015675/73
Int. Cl.² B01D *17/04*
U.S. Cl. 252—329 **12 Claims**

1. In a de-emulsifier for breaking a petroleum-water emulsion, wherein the de-emulsifier contains ethylene oxide and propylene oxide, the improvement which comprises that the de-emulsifier contains in excess of 0.001% by weight of silica having a BET surface in excess of $50m^2/g$.

4,029,597

NON-BLEEDING INDICATORS AND DYES THEREFOR USED IN pH DETERMINATION PROCESS

Karlheinz Neisius, and Wilhelm Bäumer, both of Darmstadt, Germany, assignors to E. Merck A. G., Darmstadt, Germany

Division of Ser. No. 807,411, March 14, 1969. This application Aug. 6, 1975, Ser. No. 602,470
Int. Cl.² G01N *31/00, 33/00*
U.S. Cl. 252—408 **53 Claims**

1. A process for determining the pH of a media, which comprises (a) contacting said media with a non-bleeding pH indicator comprising an insoluble polymer carrier having free hydroxyl or NH groups or mixtures thereof, and bound to said carrier an organic azo dyestuff capable of changing color in response to a change in pH, said dye being of the formula Ar — N = N — Ar wherein Ar is an aryl forming with the azo group said organic azo dyestuff, with the provision that at least one aryl group is substituted by at least one reactive group capable of forming a chemical bond with said polymeric carrier, and at least one aryl group is substituted by at least one other radical selected from the group consisting of $—SO_3H$ and —COOH, said reactive group being 2-(hydroxysulfonyloxy)-ethylsulfonyl, N-methyl-N-[2-(hydroxysulfonyloxy)-ethyl]-sulfonamide, monochlorotriazinyl, dichlorotriazinyl, mono-, di- and trichloropyrimidyl, dichloropyridazinyl, dichloroquinoxalinyl, dichlorophthalazinyl or 2-(hydroxysulfonyloxy)-ethylamino-sulfonyl; and (b) determining the pH from the resultant color of said indicator.

4,029,598

NON-BLEEDING INDICATOR AND DYES THEREFOR

Karlheinz Neisius, and Wilhelm Bäumer, both of Darmstadt, Germany, assignors to E. Merck A. G., Darmstadt, Germany

Filed Mar. 14, 1969, Ser. No. 807,411
Int. Cl.² G01N *31/00, 33/00*
U.S. Cl. 252—408 **54 Claims**

1. A non-bleeding pH indicator consisting essentially of an insoluble polymer carrier having free hydroxyl or NH groups or mixtures thereof, and bound to said carrier an organic azo dyestuff capable of changing color in response to a change in pH, said carrier having been reacted with a dyestuff of the formula Ar — N = N — Ar wherein Ar is aryl forming with the azo group said organic azo dyestuff, with the provision that at least one aryl group is substituted by at least one reactive group capable of forming a chemical bond with said carrier, and at least one aryl group is substituted by at least one other radical selected from the group consisting of $—SO_3H$ and —COOH, said reactive group being 2-(hydroxysulfonyloxy)-ethylsulfonyl, N-methyl-N-[2-(hydroxysulfonyloxy)-ethyl]-sulfonamido, monochlorotriazinyl, dichlorotriazinyl, mono-, di- and trichloropyrimidyl, dichloropyridazinyl, dichloroquinoxalinyl, dichlorophthalazinyl or 2-(hydroxy-sulfonyloxy)-ethylaminosulfonyl.

PROCESS FOR PASSIVATING A PROPHORIC CATALYST AND TAKING A HYDROGENATION REACTOR OUT OF OPERATION

Abraham A. Pegels, The Hague, Netherlands, assignor to Shell Oil Company, Houston, Tex.

Filed Apr. 18, 1975, Ser. No. 569,422
Claims priority, application Netherlands, Apr. 25, 1974, 7405565
Int. Cl.² B01J *23/92, 23/94*
U.S. Cl. 252—414 **11 Claims**

1. A process for taking passivating a pyrophoric catalyst and out of operation a reactor containing said catalyst which has been used for hydrogenation of a fluid feed, in which hydrogenation the feed is passed over a catalyst consisting essentially of cobalt sulphide and/or nickel sulphide combined with molybdenum sulphide and/or tungsten sulphide or a carrier at least the greater part of which consists of silica and/or alumina in the presence of added hydrogen, said process comprising:
a. When the temperature in the reactor is above 300° C reducing the temperature below 300° C;
b. maintaining the temperature in said reactor below 300° C for following steps (d)-(h) until the reactor is opened;
c. discontinuing the supply of feed and replacing the added hydrogen with an inert purge gas at a time which may be before, after or during said reduction in temperature;
d. purging the reactor with purge gas and a hydrocarbon gas oil wherein the amount of hydrocarbon gas oil is from about 5 to about 25% of the design feed rate of the reactor;
e. subsequent to step (d) introducing an oxygen-containing gas into the purge gas in a quantity such that the initial oxygen content of the purge gas is at most 1% by volume;
f. circulating simultaneously said gas oil and said oxygen containing purge gas through the reactor;
g. increasing gradually the oxygen content of the purge gas to the reactor until the oxygen partial pressure of the purge gas is brought to at least 0.2 kg/cm^2, and continuing the circulation of said gas oil and said oxygen containing purge gas until no further appreciable heat generation in the reactor is found to occur, and then discontinuing said circulation and;
h. opening the reactor.

7. A process as in claim 1, wherein oxygen is added to the purge gas to the reactor incrementally or continuously at a rate whereby the carbon dioxide content of purge gas from the reactor remains below about 0.04% by volume.

9. A process as in claim 1, wherein the reactor has been in operation for the catalytic reduction to hydrogen sulphide of sulphur compounds in a gaseous feed.

CARBON PARTICULATES WITH CONTROLLED DENSITY

Joseph Lawrence Schmitt, Jr., Bethel, Conn.; Philip Leroy Walker, Jr., State College, Pa., and George Augustus Castellion, Stamford, Conn., assignors to American Cyanamid Company, Stamford, Conn.

Continuation-in-part of Ser. No. 559,933, March 19, 1975, abandoned. This application May 20, 1976, Ser. No. 688,508
Int. Cl.² B01J *21/18*
U.S. Cl. 252—444 **17 Claims**

1. A porous carbon particulate comprising carbon black spheres bonded in molded relationship by a carbonized binder, said spheres having an average diameter in the range of about 80 to 5000 angstrom units and a surface area of at least 100 square meters per gram, and said particulate having a pore volume of at least 0.2 cubic centimeters per gram, a surface area of at least 100 square meters per gram, said particulate surface area being equal to or less than the surface area of said spheres, and a pore size distribution such that at least about 45% of its total surface area is in pores of radius equal to or greater than 20 angstrom units.

4,029,601

NOVEL OLIGOMERIZATION CATALYSTS AND THEIR PREPARATION

Herbert K. Wiese, Cranford, N.J., assignor to Exxon Research and Engineering Company, Linden, N.J.

Filed Apr. 29, 1975, Ser. No. 572,654
Int. Cl.² B01J *21/18*
U.S. Cl. 252—447 **2 Claims**

1. A method of preparing alkene oligomerization catalysts which comprises:
a. impregnating activated carbon with a solution of cobalt amine complexes having the generic formula

$$[CoA(NH_3)_4]B$$

where A is a carbonate or oxalate radical and B is a moiety selected from the group consisting of CO_3H, CO_3NH_4, C_2O_4H and C_2O_4NH;
b. decomposing said activated carbon impregnated with said cobalt amine complexes at temperatures of between about 250° to about 350° C. to produce cobalt oxide on carbon; and thereafter,
c. admixing said cobalt oxide on carbon with a refractory oxide as a catalyst support.

4,029,602

CATALYST SYSTEM FOR CATALYTIC HEATERS

Roger Paul Pierre Risse, Caluire, France, assignor to Societe Lyonnaise des Applications Catalytiques, Rillieux-La-Pape, France

Continuation of Ser. No. 471,752, May 20, 1974, abandoned. This application Jan. 14, 1976, Ser. No. 648,869
Claims priority, application France, May 22, 1973, 73.19582
Int. Cl.² B01J 21/04, 21/08, 23/64
U.S. Cl. 252—458 7 Claims

1. A catalytic mass for the oxidation of the hydrocarbons to produce carbon dioxide and water vapor which consists of, in effective amounts:
active components of chromium oxide;
at least one catalyst oxide of an element of Group VIIB or Group VIII of the Periodic Table of Elements;
an activation metal consisting of one of the platinum-group elements; and
a reaction promoter inhibiting recrystallization of the activation metal and constituted by a refractory oxide of an element having a high electron density; and a support for said active components, said support consisting of a first supporting mass of a pulverulent material having a high specific surface area and capable of dispersing the active components; and
a second supporting mass of fibrous material in which said pulverulent material is distributed.

4,029,603

CATALYTIC COATING COMPOSITION AND A METHOD FOR MAKING A COATED SURFACE FOR AN OVEN

Patrick John Denny, Norton, and Robert Robertson, Warrington, both of England, assignors to Imperial Chemical Industries Limited and T. I. Domestic Appliances Limited, both of London, England

Continuation of Ser. No. 450,217, March 11, 1974, abandoned. This application Jan. 30, 1976, Ser. No. 653,709
Claims priority, application United Kingdom, Mar. 26, 1973, 14342/73
Int. Cl.² B01J 23/18, 23/34, 23/72, 23/84
U.S. Cl. 252—471 12 Claims

1. A coating composition suitable for application to the internal surfaces of ovens which comprises a milled self-matting devitrifying enamel frit and an adhesion-promoting compound selected from the group consisting of antimony trioxide and precursors thereof which decompose to produce antimony trioxide on heating and an oxidation catalyst containing an oxide selected from the group consisting of oxides of copper, manganese and cobalt.

4,029,604

METHOD FOR PREPARING A PHOTOCONDUCTIVE POWDER

Yoshio Enoki, Katano, and Nobumasa Ohshima, Hirakata, both of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Japan

Filed Aug. 27, 1975, Ser. No. 608,405
Claims priority, application Japan, Sept. 4, 1974, 49-102322; Sept. 5, 1974, 49-102719
Int. Cl.² H01L 31/00
U.S. Cl. 252—501 12 Claims

1. A method for preparing a photoconductive powder comprising: providing a starting mixture comprising (i) a host material consisting essentially of 65 to 95% by weight of CdSe powder, 3 to 15% by weight of ZnS powder and 2 to 20% by weight of ZnO powder, (ii) as an activator, 0.005 to 0.1 parts by weight, on the basis of 100 parts by weight of said host material, of a water soluble salt of one member selected from the group consisting of Cu and Ag and (iii) as a flux, 0.1 to 1 part by weight, on the basis of 100 parts by weight of said host material, of one member selected from the group consisting of $CdCl_2$, $CdBr_2$, $ZnCl_2$ and $ZnBr_2$; firing said starting mixture at a temperature higher than the melting point of said flux to fuse said flux and dissolve said host material in said flux; cooling the thus fired mixture to recrystallize said host material at least partially to a solid solution, the thus treated material having said activator diffused therein; and re-firing the thus treated material in a sulfur containing atmosphere to increase the threshold voltage of the material.

4,029,605

METALLIZING COMPOSITIONS

Raymond Stanley Kusiorek, Houston, Pa., assignor to Hercules Incorporated, Wilmington, Del.

Filed Dec. 8, 1975, Ser. No. 638,785
Int. Cl.² H01B 1/08
U.S. Cl. 252—514 3 Claims

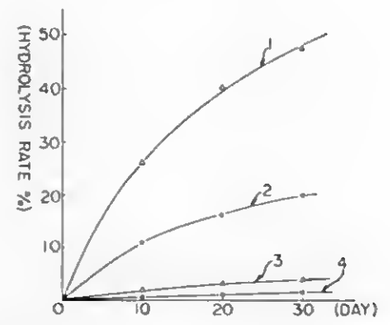
1. A conductive metal composition which when applied to and fired on a heat resistant substrate forms thereon an electrically conductive, adherent film wich does not adversely affect the overall strength of the substrate, said composition comprising by weight
a. from 50 to 88% of at least one finely-divided electrically conductive metal;
b. from 2 to 40% of a crystallizable glass frit binder consisting essentially of by weight 40 to 70% of SiO_2, 10 to 31% of Al_2O_3, 3 to 20% of Li_2O, 2 to 15% of B_2O_3, 0 to 4% of As_2O_3, 0 to 5% of Na_2O, 0 to 5% of K_2O, 0 to 6% of Bi_2O_3, and at least one oxide component selected from the group consisting of 4 to 19% of ZrO_2 and 1 to 10% of TiO_2;
c. from 5 to 48% of an inert liquid vehicle; and
d. from 0 to 20% of an inert filler or pigment.

4,029,606

NON-LIQUID DETERGENT COMPOSITION

Hiroshi Isa, Yachiyo; Noboru Suzuki, Kawasaki; Masatoshi Takahashi, Fujisawa, and Eriko Hirayama, Ichikawa, all of Japan, assignors to Lion Fat & Oil Co., Ltd., Tokyo, Japan

Filed May 9, 1975, Ser. No. 576,164
Claims priority, application Japan, Dec. 5, 1974, 49-139745
Int. Cl.² C11D 1/08
U.S. Cl. 252—529 13 Claims



1. A solid detergent composition in the form of a powder, granules or tablets, consisting essentially of a mixture obtained by blending
a. from 5 to 80 weight percent of organic surfactant substance having the formula

$$\left[RCO\left(\begin{matrix} R' \\ | \\ OCHCO \end{matrix} \right)_n O \right]_m M$$

wherein R is saturated or unsaturated straight-chain or branched-chain hydrocarbon having 5 to 19 carbon atoms, with the proviso that more than 70 weight percent of R has from 10 to 14 carbon atoms, R' is hydrogen, CH_3 or C_2H_5, n is a number in the range of 1.7 to 6.5 on the average, M is a monovalent or divalent cation, and m is one or 2 depending on the valency of M, and
b. from 5 to 95 weight percent of water-soluble organic or inorganic salt selected from the group consisting of sodium sulfate, sodium carbonate, sodium bicarbonate, sodium chloride, sodium phosphate, sodium tripolyphosphate, sodium borate, potassium carbonate, magnesium sulfate, sodium citrate, sodium tartrate, sodium malate, sodium succinate, sodium sulfosuccinate, sodium lactate, sodium glycolate, potassium citrate, potassium lactate, calcium citrate and calcium lactate, or mixtures thereof, with the proviso that one percent aqueous solutions of said salts have a pH of from 6 to 11, said composition additionally containing from 5 to 30 weight percent of anhydrous calcium chloride,
said composition containing less than 0.8 mole of free water per mole of ester linkages in said organic surfactant substance.

4,029,607

DRAIN CLEANING COMPOSITIONS

Justin J. Murtaugh, Guilford, Ind., assignor to The Drackett Company, Cincinnati, Ohio

Continuation-in-part of Ser. No. 456,431, March 29, 1974, abandoned. This application Feb. 19, 1976, Ser. No. 659,186
Int. Cl.² C11D 3/26, 7/32
U.S. Cl. 252—545 8 Claims

1. A drain cleaning composition consisting essentially of:
from about 0.25% to 5%, by weight, of a member selected from the group consisting of an ammonium, alkylamine, hydroxy-alkylamine salt of nitrilotriacetic acid, N-2-hydroxy-ethylimino diacetic acid, an alkylene polyamine polycarboxylic acid, and mixtures thereof;
from about 0.12% to 15%, by weight, of a surfactant selected from the group consisting of an ammonium, alkylamine, or hydroxyalkylamine salt of an anionic surfactant and mixtures thereof, wherein said anionic surfactant is selected from the group consisting of:
lauryl sulfate;
a sulfated linear primary alcohol ethoxylate;
a phosphate ester having the formula

$$[R{-}O\ (CH_2CH_2O)_x]_y\overset{O}{\overset{\|}{P}}(OH)_{3-y}$$

where x has a value of 1 to 15 and y has a value of 1 to 2, and R is an alkyl or phenalkyl radical having from 6–150 carbon atoms;
a derivative of sulfo succinic acid;
an alkyl aryl sulfonate;
an alkyl sulfate; and
an alkyl ethylene oxide ether sulfate; and
up to about 99%, by weight, of water, wherein said alkylamine and hydroxy-alkylamine have a chain length of from 1 to 5 carbon atoms and said composition is substantially free of alkali metal ions.

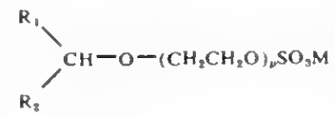
4,029,608

GRANULAR OR POWDERY DETERGENT COMPOSITION

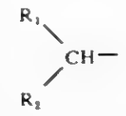
Moriyasu Murata, Chiba; Fumio Sai, Funabashi, and Takashi Fujino, Yokohama, all of Japan, assignors to Kao Soap Co., Ltd., Tokyo, Japan

Filed Sept. 21, 1976, Ser. No. 725,171
Claims priority, application Japan, Sept. 30, 1975, 50-117815
Int. Cl.² C11D 1/72, 1/83, 3/20
U.S. Cl. 252—551 4 Claims

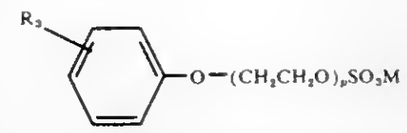
1. A granular or powdery detergent composition consisting essentially of
1. from 2 to 40 percent by weight of a first surfactant having a tendency to cake selected from the group consisting of
a. alkylethoxy sulfates having the formula



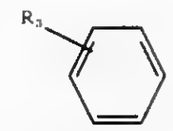
wherein R_1 and R_2, which can be the same or different, are hydrogens, alkyls having one to 17 carbon atoms, or alkenyls having one to 17 carbon atoms, provided that the average carbon atom number of



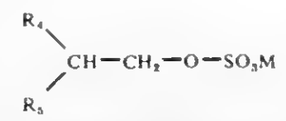
is from 10 to 18 carbon atoms, p is a number of from 0.5 to 5, and M is an alkali metal or an alkaline earth metal,
b. alkylphenylethoxy sulfates having the formula



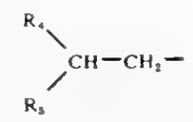
wherein R_3 is alkyl having 4 to 16 carbon atoms or alkenyl having 4 to 16 carbon atoms, provided that the average carbon atom number of



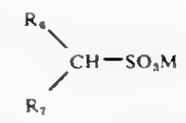
is from 10 to 18, and p and M are the same as defined above,
c. branched alkyl sulfates having the formula



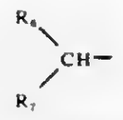
wherein R_4 and R_5, which can be the same or different, are alkyls having one to 15 carbon atoms or alkenyls having one to 15 carbon atoms, provided that



contains from 10 to 18 carbon atoms, and M is the same as defined above,
d. alkane sulfonates having the formula

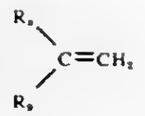


wherein R_6 and R_7, which can be the same or different, are hydrogens or alkyls having one to 17 carbon atoms, provided that



contains from 10 to 18 carbon atoms and M is the same as defined above,

e. sulfonate salts of vinylidene olefins having the formula



wherein R_8 and R_9, which can be the same or different, are alkyls having 1 to 15 carbon atoms, provided that the number of carbon atoms in the olefin molecule is from 10 to 18, and the salt-forming cation is an alkali metal or alkaline earth metal,

f. sulfonate salts of internal olefins having the formula

$R_{10}HC=CHR_{11}$

wherein R_{10} and R_{11}, which can be the same or different, are hydrogens or alkyls having one to 17 carbon atoms, provided that the number of carbon atoms in the olefin molecule is from 10 to 20 and further provided that in up to 80 wt.% of the olefin molecules, one of R_{10} and R_{11} can be hydrogen, and in the balance of the olefin molecules, neither of R_{10} and R_{11} is hydrogen, and the salt-forming cation is an alkali metal or alkaline earth metal,

g. ethylene oxide nonionic surface active agents having an HLB value of from 8 to 18 and selected from the group consisting of polyoxyethylene (6 to 12) alkyl (C_{12} to C_{18}) or alkenyl (C_{12} to C_{18}) ethers, polyoxyethylene (6 to 12) alkyl (C_6 to C_{10}) phenyl ethers, polyoxyethylene (8 to 20) saturated or unsaturated fatty acid (C_{12} to C_{18}) esters and polyoxyethylene (4 to 20) sorbitan saturated or unsaturated fatty acid (C_{12} to C_{18}) esters, and mixtures thereof,

II. from 0.2 to 20 percent by weight of an anti-caking agent having the formula

$RO(CH_2CH_2O)_nH$

wherein R is alkyl or alkenyl having 12 to 18 carbon atoms, and n is a number from 100 to 300, the weight ratio of II/I being at least 10/100 or higher,

III. from zero to 20 percent by weight of second surfactant selected from the group consisting of alkylbenzene sulfonates in which the alkyl has 10 to 16 carbon atoms, linear alkyl sulfates having an average of 11 to 18 carbon atoms, α-olefin sulfonates having 10 to 20 carbon atoms and mixtures thereof; and

IV. from 10 to 40 weight percent of water-soluble inorganic alkaline detergent builders, or water-soluble inorganic neutral detergent builders, or water-soluble organic detergent builders, or mixtures thereof.

4,029,609

NOVEL POLYETHERS HAVING PENDENT AMINOMETHYLENE GROUPS AND HAVING IMPROVED THERMAL AND CHEMICAL STABILITY

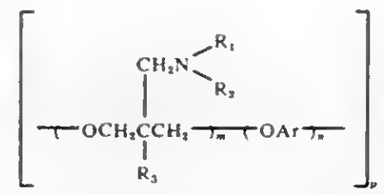
Masakazu Tanaka, and Kazuo Watanabe, both of Otsu, Japan, assignors to Toyo Boseki Kabushiki Kaisha, Japan

Filed June 11, 1975, Ser. No. 585,779

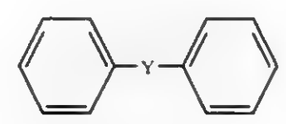
Int. Cl.² C08G *65/00*

U.S. Cl. 260—2 R **11 Claims**

1. Polyethers of the general formula:

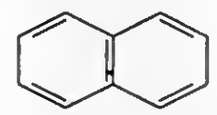


wherein, R_1 and R_2 are each a hydrogen atom or an alkyl group having 1 to 6 carbon atoms and, R_1 and R_2, when these are bonded to each other, are polymethylene groups that form a heteroring with the nitrogen atom, R_3 is a hydrogen atom or an alkyl group of 1 to 4 carbon atoms, m is an integer from 1 to 20, n is 0 or 1, p is an integer from 5 to 1000 and Ar is at least one member selected from the group consisting of divalent aromatic residues of the following formulas:



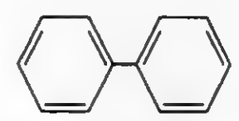
(1)

(2)



(3)

and



(4)

in which in the formula (1), Y is an alkylene group of 1 to 4 carbon atoms, an alkylidene group of 3 to 15 carbon atoms, —O—, —SO_2—, —S— or >C=O.

4,029,610

CARBODIIMIDE-ISOCYANURATE FOAMS CONTAINING URETHANE LINKAGES

Thirumurti L. Narayan, Riverview, and Moses Cenker, Trenton, both of Mich., assignors to BASF Wyandotte Corporation, Wyandotte, Mich.

Division of Ser. No. 472,587, May 23, 1974, Pat. No. 3,922,238. This application Apr. 9, 1975, Ser. No. 566,249

The portion of the term of this patent subsequent to June 3, 1992, has been disclaimed.

Int. Cl.² C08G *18/18, 18/30, 18/48*

U.S. Cl. 260—2.5 BF **7 Claims**

1. A cellular foam composition characterized by carbodiimide, isocyanurate and urethane linkages prepared by condensing an organic polyisocyanate in the presence of a blowing agent, from 0.01 to 0. equivalent per equivalent of isocyanate of a primary hydroxy-terminated polyoxyalkylene or polyester polyol having an average functionality of from two to eight and an average equivalent weight of from about 150 to 1500 and a catalytically sufficient amount of a catalyst system consisting essentially of (a) from 0.1 part to 10 parts of methanol per 100 parts of organic polyisocyanate, (b) a tertiary amine trimerization catalyst, and (c) a urethane catalyst.

4,029,611

CARBODIIMIDE-ISOCYANURATE FOAMS MODIFIED WITH POLYFURFURYL ALCOHOL POLYMERS

Moses Cenker, Trenton; Thirumurti Narayan, Riverview, and John Thomas Patton, Jr., Wyandotte, all of Mich., assignors to BASF Wyandotte Corporation, Wyandotte, Mich.

Filed Dec. 18, 1975, Ser. No. 642,163

Int. Cl.² C08G *18/54*

U.S. Cl. 260—2.5 AW **10 Claims**

1. A cellular foam characterized by carbodimide and isocyanurate linkages prepared by catalytically condensing an organic polyisocyanate in the presence of (a) a carbodiimide-promoting catalyst; (b) a trimerization catalyst, and (c) from 5 to 100% by weight, based on the weight of the organic polyisocyanate of a polyfurfuryl alcohol polymer.

4,029,612

SILICA CONTAINING BLOWING AGENT COMPOSITIONS AS PLATE-OUT PREVENTIVES IN FOAMED PLASTICS PROCESSES

Kenneth Thomas Collington, Loughborough, England, assignor to Fisons Limited, England

Continuation-in-part of Ser. No. 328,079, Jan. 30, 1973, which is a continuation-in-part of Ser. No. 164,473, July 20, 1971. This application Mar. 25, 1975, Ser. No. 562,035

Claims priority, application United Kingdom, July 31, 1970, 37047/70; Aug. 5, 1970, 37779/70; Aug. 26, 1970, 41006/70; Dec. 7, 1972, 56562/72

U.S. Cl. 260—2.5 E **18 Claims**

1. A particulate blowing agent composition comprising azodicarbonamide, and a colloidal of fumed silica having a BET surface area of 200 to 400 m^2/g and an available water content of 2 to 20% by weight, the weight ratio of silica to azodicarbonamide being from 1:5 to 5:1 and such as to provide 1.5 to 20 parts by weight available water per 100 parts by weight azodicarbonamide.

4,029,613

ANTILUMPING EXPANDING STYRENE POLYMERS

John J. Quinlan, Atco, N.J.; James J. Garland, and Jose E. Granda, both of Aliquippa, Pa., assignors to ARCO Polymers, Inc., Philadelphia, Pa.

Filed Dec. 29, 1975, Ser. No. 644,355

Int. Cl.² C08J *9/22*

U.S. Cl. 260—2.5 B **2 Claims**

1. Expandable styrene polymer particles which will not lump during pre-expansion, comprising styrene polymer particles containing a blowing agent and having on their surface from 0.02 to 0.05 percent by weight based on polymer of hydrated calcium polysilicate consisting of 73–83 percent by weight of silicon dioxide, less than 1 percent by weight aluminum oxide, 3–7 percent by weight of calcium oxide, and 9–20 percent by weight water.

4,029,614

PARTICULATE EXPANDABLE STYRENE POLYMERS HAVING GOOD PROCESSABILITY

Eckhard Nintz; Rupert Schick, both of Ludwigshafen; Karl Seegmueller, Lambsheim, and Erhard Stahnecker, Heidelberg, all of Germany, assignors to BASF Aktiengesellschaft, Ludwigshafen, Germany

Claims priority, application Germany, May 9, 1975, 2520635

Filed Apr. 12, 1976, Ser. No. 676,248

Int. Cl.² C08J *9/18*

U.S. Cl. 260—2.5 B **8 Claims**

1. Expandable styrene polymers containing a foaming agent and from about 0.05 to 1% by weight of the styrene polymer of brominated oligomers of butadiene or styrene, brominated phosphoric acid esters, nuclear brominated phenyl alkyl ethers, pentabromo monochlorocyclohexane or 1,3,4-tribromo-4-phenylbutanone-(2) and additionally containing from 0.0001 to 1.0% by weight of the styrene polymer, of a styrene-soluble amine free from hydroxyl groups, said amine having the formula $NR^1R^2R^3$, wherein R^1 is an aliphatic or cycloaliphatic hydrocarbon radical of from 4 to 20 carbon atoms, R^2 is hydrogen or an aliphatic or cycloaliphatic hydrocarbon radical of from 1 to 15 carbon atoms, and R^3 is hydrogen or an aliphatic or aromatic hydrocarbon of from 1 to 15 carbon atoms, with the proviso, that when R^2 and R^3 are both hydrogen, then R^1 has from 6 to 20 carbon atoms.

4,029,615

POLYMERIC CELLULAR STRUCTURES

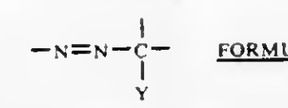
Ernest Rudolph Kamens, Tonawanda; Donald Milton Kressin, Getzville; Harold Carl Lange, Grand Island, and Ronald Edward MacLeay, Williamsville, all of N.Y., assignors to Pennwalt Corporation, Philadelphia, Pa.

Division of Ser. No. 548,946, Feb. 11, 1975, Pat. No. 3,993,609, which is a continuation-in-part of Ser. No. 453,446, March 21, 1974, abandoned. This application Aug. 26, 1976, Ser. No. 718,449

Int. Cl.² C08J *9/02*

U.S. Cl. 260—2.5 R **10 Claims**

1. Cellular polymeric structures prepared by the process which comprises mixing an acidulous or acidic polymerizable medium that is polymerizable and/or cross-linkable by a free radical mechanism with an effective amount of an acid sensitive mono- or poly-azo compound containing the group:



FORMULA I

wherein Y is an acid sensitive group which in the presence of an acidulous or acidic polymerizable medium causes sufficient decomposition of the azo compound that gas is released in said medium and during said decomposition said mono- or poly-azo compound promotes polymerization and/or cross-linking of said medium to provide a matrix that is sufficiently polymerized and/or cross-linked that the generated gases cause the matrix to expand, each of the remaining valences being satisfied by an organic radical; provided that any carbon atom that is directly linked to an azo nitrogen, except that of a carbonyl group, has at least two of its remaining three valences satisfied by a carbon to carbon bond or a carbon to hydrogen bond.

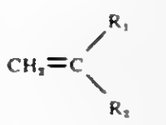
U.S. Cl. 260—17.4 ST **17 Claims**

1. A polymer composition obtained by polymerizing an ethylenic compound selected from the group consisting of compounds represented by the formula,

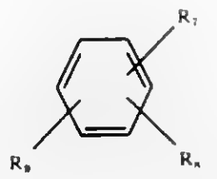


wherein

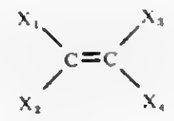
R_1 is H, a C_1–C_4 hydrocarbon group, a halogen or a hydroxyl group; and

R_2 is H, a C_1–C_4 hydrocarbon group, a halogen, —$OCOR_3$

where R_3 is a C_1–C_{18} hydrocarbon group, —$COOR_4$ where R_4 is H, an alkali metal, an alkaline earth metal, a C_1–C_{12} hydrocarbon group, or a halogen-, hydroxyl group-, alkoxy group- or epoxy group- substituted derivative thereof; —CN, —$CONR_5R_6$ where R_5 and R_6 are independently H, a C_1–C_{12} hydrocarbon group or a halogen-, hydroxyl group-, or alkoxy group-, or epoxy group-substituted derivative thereof; —$CH{=}CH_2$, or



where R_7, R_8, and R_9 are independently H, a C_1–C_4 hydrocarbon group, a halogen, a hydroxyl group or an alkoxy group; or compounds represented by the formula



wherein X_1, X_2, X_3, and X_4 are independently H, a halogen or —$COOR_1$ where R_1 is a C_1–C_4 hydrocarbon group, an alkali metal or an alkaline earth metal, with the proviso that X_2 and X_4 are substituents other than H; maleic anhydride and anhydrous maleimide in the presence of pullulan having a molecular weight of 10,000 to 5,000,000

and in the presence or absence of a solvent and a catalyst, said ethylenic compound being present in an amount of 5 to 90 weight % based on the solid content of the resulting composition and the remainder of the solid content being said pullulan.

4,029,617

PROCESS FOR THE PRODUCTION OF WATER-DILUTABLE BINDERS BASED ON AIR-DRYING SHORT-OIL ALKYD RESINS

Rolf Dhein; Jochen Schoeps, both of Krefeld; Johannes Beckers, Kempen, and Rolf Kuchenmeister, Krefeld, all of Germany, assignors to Bayer Aktiengesellschaft, Germany

Filed Sept. 23, 1975, Ser. No. 616,070

Claims priority, application Germany, Sept. 28, 1974, 2446439

Int. Cl.² C09D *3/40, 3/56*

U.S. Cl. 260—20 **1 Claim**

1. A water-dilutable binder based on an air-drying short-oil alkyd resin which is essentially free of urethane groups and contains natural, unsaturated fatty acids in an amount of from 15 to 50% by weight, said binder having been prepared by

a. co-condensing in a single process stage

i. 2 to 10% by weight, of natural-resin-modified phenol resol resin and

ii. 90 to 98% by weight, of a mixture of a polyalcohol, a polycarboxylic acid or its anhydride and a monocarboxylic acid, the molar ratio of polyalcohol to polycarboxylic acid or anhydride to monocarboxylic acid being 1 to 0.5-1 to 0.3-1, until an alkyd resin with an acid number of from 30 to 70 and an OH number of from 40 to 120 is formed and

b. acidifying said alkyd resin by semiester formation with a dicarboxylic acid anhydride.

4,029,618

VINYL HALIDE STABILIZER COMPOSITIONS OF ANTIMONY ORGANIC SULFUR-CONTAINING COMPOUNDS AND ORTHO-DIHYDRIC PHENOLS

Dale J. Dieckmann, Euclid, Ohio, assignor to Dart Industries Inc., Los Angeles, Calif.

Filed June 30, 1975, Ser. No. 592,038

Int. Cl.² C08K *5/59*

U.S. Cl. 260—23 XA **20 Claims**

8. A vinyl halide resin composition which comprises a vinyl chloride resin and, as a heat stabilizer, an effective amount of a composition consisting essentially of,

an antimony organic sulfur-containing compound having the formula

R_nSbX_{3-n}

where R of the formula is selected from the group consisting of alkyl, alkenyl, alkynyl, aryl, cycloalkyl, cycloalkenyl, mixed aryl-alkyl, and substituted groups thereof, wherein X of the formula is selected from the group consisting of sulfur, SR and SRCOOR′, where R of the group SR is selected from alkyl, aryl, mixed aryl-alkyl, and substituted groups thereof, where R of the group SRCOOR′ is selected from alkylene, arylene, aralkylene, and substituted groups thereof, wherein R′ of the group SRCOOR′ is selected from alkyl, aryl, mixed aryl-alkyl, and substituted groups thereof, where n is an integer of 0 to 2, and

a phenol selected from the group consisting of o-dihydric phenols and o-dihydric alkyl phenols, and mixtures thereof, said antimony compound and phenol components in relative amounts which together provide a synergistic heat stabilizing effectiveness upon said resin.

4,029,619

METHOD OF PREPARING VINYL CHLORIDE RESINS

Shigenobu Tajima, Joetsu, and Kazuhiko Kurimoto, Ibaragi, both of Japan, assignors to Shinetsu Chemical Company, Tokyo, Japan

Filed Dec. 5, 1972, Ser. No. 312,306

Claims priority, application Japan, Dec. 7, 1971, 46-4698805

The portion of the term of this patent subsequent to Sept. 14, 1993, has been disclaimed.

Int. Cl.² C08L *91/60*

U.S. Cl. 260—23 XA **12 Claims**

1. A method comprising polymerizing in aqueous medium, under the influence of at least one oil soluble polymerization initiator, vinyl chloride or a mixture thereof with at least one copolymerizable monomer, containing at least 50% by weight of the vinyl chloride in the presence of (a) from 0.5 to 4% by weight, based on the weight of the monomer mixture, of at least one alkali metal salt of higher fatty acid, having from 8 to 18 carbon atoms in the molecule, (b) from 0.05 to 3% by weight, based on the weight of the monomer mixture and equivalent to from 4 to 75% by weight of said alkali metal salt, of at least one higher alcohol or higher fatty acid, having 8 to 18 carbon atoms, alone or in combination, and (c) from 0.001 to 0.1% by weight, based on the weight of the monomer mixture, of at least one hydroxide of alkali metal.

4,029,620

BLENDS OF PARTIALLY NEUTRALIZED CARBOXYL FUNCTIONAL COPOLYMERS AND EPOXY RESINS IN AQUEOUS EMULSION

Albert C. Chen, East Brunswick, N.J., assignor to Mobil Oil Corporation, New York, N.Y.

Filed Aug. 13, 1975, Ser. No. 604,286

Int. Cl.² C08L *33/02*

U.S. Cl. 260—29.6 NR **13 Claims**

1. A thermally curable aqueous emulsion coating composition comprising an aqueous continuum having dispersed

therein emulsified liquid particles of resinous polyepoxide, said polyepoxide particles being stably suspended by means of a nonionic surfactant used in an amount of from 0.5–10%, based on the total weight of resin, said aqueous continuum further containing an organic solvent-soluble carboxyl functional copolymer containing from 4–20% copolymerized monoethylenic monomer carrying the carboxyl group stably dispersed in the aqueous continuum by salt formation between some of the carboxy groups in the copolymer, and volatile base selected from organic amines and ammonia, the extent of neutralization of the copolymer carboxyl by said base being less than about 30% neutralization when amine is used and being up to about 90% when ammonia is used, said polyepoxide being present in an amount to provide at least about a stoichiometric proportion of epoxy functionality with respect to the carboxyl functionality of the copolymer, up to about a 25% excess of epoxy functionality.

4,029,621

REACTION PRODUCTS OF A POLYEPOXIDE WITH A THIOL HAVING A GROUP HYDROYZABLE TO CARBOXYL, AND AQUEOUS SOLUBILIZED PRODUCTS

Marvis E. Hartman, Pittsburgh; Thomas R. Hockswender, Gibsonia; Rostyslaw Dowbenko, Gibsonia, and Roger M. Christenson, Gibsonia, all of Pa., assignors to PPG Industries, Inc., Pittsburgh, Pa.

Continuation-in-part of Ser. No. 602,858, Aug. 7, 1975, abandoned. This application Apr. 28, 1976, Ser. No. 680,935

Int. Cl.² C08G *59/16, 59/66*

U.S. Cl. 260—29.2 EP **32 Claims**

1. An aqueous composition comprising the solubilized reaction product of:

A. a polyepoxide containing a 1,2-epoxy equivalency greater then 1.0; and

B. a compound containing a mercaptan group and at least one group hydrolyzable to a carboxyl group, said compound having the structural formula:

$HS{-}R{-}(W)_m$

wherein m is an integer from 1 to 5, R is an organic radical having from 1 to 10 carbon atoms and W is a group hydrolyzable to a carboxyl group.

4,029,622

NON-AQUEOUS POLYMER DISPERSIONS OF WATER-SOLUBLE MONOMERS

Wilfried Keller, Opladen, and Friedhelm Müller, Odenthal, both of Germany, assignors to Bayer Aktiengesellschaft, Germany

Filed Apr. 21, 1975, Ser. No. 570,185

Claims priority, application Germany, Apr. 24, 1974, 2419764

Int. Cl.² C08L *33/26*

U.S. Cl. 260—29.6 WQ **1 Claim**

1. A stable, storable, non-aqueous dispersion which is rapidly dilutable with water to form a polymer solution and whose average particle size of the dispersed phase is from 0.01 to 1μ, said dispersion consisting essentially of

a. at least one water-soluble polymer having an average molecular weight of at least 5,000,000,

b. a liquid aliphatic or aromatic hydrocarbon selected from the group consisting of toluene, decalin, n-paraffins, iso-paraffins and mixtures thereof and

c. 5 to 20% by weight, based on the weight of the dispersion, of a water-soluble wetting agent selected from the group consisting of ethoxylated alkyl phenols and ethoxylated aralkyl phenols having from 8 to 20 carbon atoms in the alkyl and aralkyl moieties thereof,

said dispersion having been obtained by polymerizing at least one water-soluble α,β-monoolefinically unsaturated monomer in a water-in-oil emulsion by means of at least one photoinitiator and UV light and subsequently removing water from said product of polymerization, either before or after the addition of said water-soluble wetting agent, to a residual water content of less than 5% by weight, based on the weight of the polymer in said dispersion.

4,029,623

GLASS FIBER SIZING COMPOSITIONS FOR THE REINFORCEMENT OF RESIN MATRICES

John Maaghul, Monroeville, Pa., assignor to PPG Industries, Inc., Pittsburgh, Pa.

Division of Ser. No. 512,646, Oct. 7, 1974, Pat. No. 3,936,285. This application Aug. 20, 1975, Ser. No. 606,272

Int. Cl.² C08L *33/04*

U.S. Cl. 260—29.6 RW **9 Claims**

1. An aqueous sizing composition for sizing glass fibers used for reinforcing resinous matrices comprising:

a water solubilized, condensation, cross-linkable, first unsaturated polyester resin, said polyester resin substantially insoluble in aromatic solvents when crosslinked;

a second unsaturated water dispersible and insoluble polyester resin, said second polyester resin being insoluble in said first polyester resin in a water solution and said second polyester resin preventing the migration of said sizing composition;

a plasticizer;

a first silane coupling agent to promote adhesion between said glass fibers and said resin matrix;

a second silane coupling agent to control the wetting of said glass fibers by said first silane-coupling agent;

a thermoplastic polymer being of sufficiently low molecular weight to impart pressure sensitive adhesive characteristics to said sizing composition; and

a major amount of water.

4,029,624

EMULSION POLYMERIZATION OF ACRYLATE OR OTHER VINYL MONOMERS USING SELECTED MIXTURES OF SOLUBLE SALTS OF CERTAIN SULFOSUCCINIC ACID HALF ESTERS

Herbert Burkhard, Eastchester, N.Y.; Nelson Nae-Ching Hsu, Stamford, Conn., and Edward Joseph Fetter, East Brunswick, N.J., assignors to American Cyanamid Company, Stamford, Conn.

Continuation-in-part of Ser. No. 457,287, April 2, 1974, Pat. No. 3,947,400. This application Dec. 8, 1975, Ser. No. 638,478

The portion of the term of this patent subsequent to Mar. 30, 1993, has been disclaimed.

Int. Cl.² C08L *33/08, 33/10*; **B01F** *17/10*

U.S. Cl. 260—29.6 TA **24 Claims**

1. A surfactant mixture of 100 parts by weight consisting of:

from 57 to 87 parts by wt. of a soluble salt of the sulfosuccinate half ester of an alcohol selected from branched-chain alkanols having 8 to 12 carbon atoms,

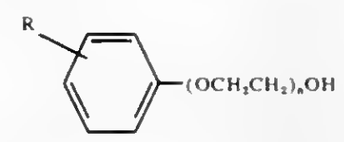
from 0 to 30 parts by wt. of a soluble salt of the sulfosuccinate half ester of an alkyl-polyoxyethylene alcohol having the formula,

$R(OCH_2CH_2)_nOH$ wherein

R is alkyl having 6 to 20 carbon atoms and

n is a value in the range from 2 to 50; and

from 0 to 33 parts by weight of a soluble salt of the sulfosuccinate half ester of a polyethoxyalkylphenol having the formula,



R is alkyl having 6 to 12 carbon atoms and

n is a value in the range from 2 to 50.

6. An aqueous latex of acrylate copolymer in which acrylate

monomer units selected from ethyl acrylate and methyl methacrylate predominate and having a minor proportion in said polymer of N-methylolacrylamide cross-linking units, said latex containing about 1 to 4 percent by wt. based on the polymer weight of a surfactant mixture defined by claim 1 as the emulsifier for said latex.

4,029,625

NON-PHASING CHLOROPRENE POLYMER ADHESIVE COMPOSITION AND PREPARATION THEREOF

Yasuaki Denda; Takashi Kadowaki, and Michio Dohi, all of Omi, Japan, assignors to Denki Kagaku Kogyo Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 411,820, Nov. 1, 1973, Pat. No. 3,941,738. This application Aug. 27, 1975, Ser. No. 608,321

Int. Cl.² C08K *5/02;* **C08K** *5/10;* **C08L** *61/10*

U.S. Cl. 260—31.4 R **6 Claims**

1. In a non-phasing chloroprene polymer adhesive composition comprising:

a. 100 parts by weight of a chloroprene polymer,

b. 1–50 parts by weight of a metal oxide,

c. 5–100 parts by weight of an alkylphenol-formaldehyde resin,

a., b., and c. being admixed with an organic solvent so as to obtain a solids content of said adhesive composition of from 5–60%,

the improvement wherein said chloroprene polymer is prepared by the emulsion polymerization of chloroprene or a mixture of chloroprene and a comonomer in the presence of a non-ionic polyoxyethylene ether or ester surfactant.

4,029,626

POLYURETHANE COMPOSITION HAVING EASY-REENTRY PROPERTY

George W. Gillemot, Santa Monica; Robert Gamero, Whittier; Augusto E. Benavides, Granada Hills, and Robert James Elms, Sepulveda, all of Calif., assignors to Communications Technology Corporation and John T. Thompson, both of Los Angeles, Calif., part interest to each

Filed Nov. 24, 1975, Ser. No. 634,866

Int. Cl.² C08K *5/11*

U.S. Cl. 260—31.6 **13 Claims**

1. A two part package assembly adapted for producing a solid polyurethane composition when the contents of the two parts are intermingled, which assemhly consists essentially of:

I. a first package part containing an NCO group containing composition, which comprises liquid polyurethane prepolymer, made from;

a. organic diisocyanate;

b. aliphatic triol of a molecular weight of about 1500–6000, wherein the NCO/OH ratio of said diisocyanate and said triol is about 1.0–1.6; and

c. liquid, organic plasticizer material essentially inert to NCO reaction and essentially compatible with the diisocyanate triol reaction product; said organic plasticizer being present in an amount to provide a composition having an NCO content of about 1.2–2.5 weight % and wherein said triol provides the bulk of the weight sum of the said diisocyanate, triol and organic plasticizer; and

II. a second package part containing a curing solution composition consisting essentially of;

a. a curing agent, in a curing amount, for the polyurethane prepolymer composition of (I) selected from the class consisting of organic diamines and aminoalkanols;

b. liquid, organic plasticizer material essentially inert to NCO reaction and essentially compatible with the cured, solid polyurethane composition; and

c. organo-metallic compound effective for catalyzing the ambient temperature reaction of isocyanate groups and hydroxyl or amine groups; and soluble in said plasticizer, wherein said first and second packages are intermingled in proportions to yield upon curing, a solid polyurethane composition having a Shore hardness of about 5–20 in a curing time of not more than about 60 minutes at about 20° C.

9. A solid, polyurethane composition possessing structural strength against rebounding forces and also possessing the characteristic of crumbling under shearing force applied to the surface of the solid or from the interior of the solid, permitting the solid to be removed from another solid object which is encapsulated, embedded, or coated with said solid polyurethane which comprises the reaction product between an NCO group prepolymer and a curing solution, said NCO group prepolymer comprising:

I. an NCO group containing composition having liquid polyurethane prepolymer, made from:

a. organic diisocyanate;

b. aliphatic triol of a molecular weight of about 1500–6000 wherein the NCO/OH ratio of said diisocyanate and said triol is about 1.0–1.6; and

c. liquid, organic plasticizer material essentially inert to NCO reaction and essentially compatible with the diisocyanate-triol reaction product, said organic plasticizer being present in an amount to provide a composition having an NCO content of about 1.2–2.5%, and said triol providing the bulk of the weight sum of the said diisocyanate, triol and organic plasticizer; and

II. said curing solution consisting essentially of:

a. a curing agent, in a curing amount, for the polyurethane prepolymer composition of (I) selected from the class consisting of organic diamines and aminoalkanols;

b. liquid, organic plasticizer material essentially inert to NCO reaction and essentially compatible with the cured, solid polyurethane composition; and

c. organo-metallic compound effective for catalyzing the ambient temperature reaction of isocyanate groups and hydroxyl or amine groups; and soluble in said plasticizer; said prepolymer composition and said curing composition intermingled in proportions to yield upon curing, at ambient temperatures, a solid polyurethane composition possessing the aforesaid crumbling characteristic and having a Shore hardness of about 5–20 in a curing time of not more than about 60 minutes at about 20° C.

4,029,627

OLIGOMERIC POLYESTERS FROM LONG-CHAIN DICARBOXYLIC ACIDS AS PLASTICIZERS FOR VINYL POLYMERS

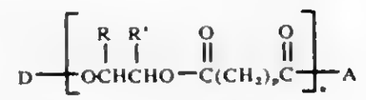
Shu-Pei Chang, Peoria, Ill., and Robert W. Ridgway, Winter Park, Fla., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Continuation-in-part of Ser. No. 611,374, Sept. 8, 1975, abandoned. This application Dec. 28, 1976, Ser. No. 754,940

Int. Cl.² C08K *5/10*

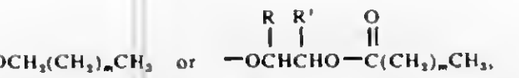
U.S. Cl. 260—31.6 **9 Claims**

1. Vinyl polymer plasticizer compositions comprising condensates having the structure:



wherein *n* is from 2 to 15, D is either

A is either

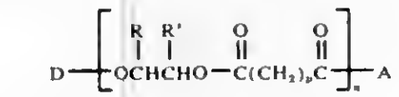


m is from 2 to 10, p in each of said condensates is 11 or 7 or admixtures thereof, with the proviso that condensates wherein p is exclusively 7 are admixed with those having p equal to 11, and R and R′ are either —H or —CH_3, with the proviso that R and R′ on adjacent carbon atoms are not the same.

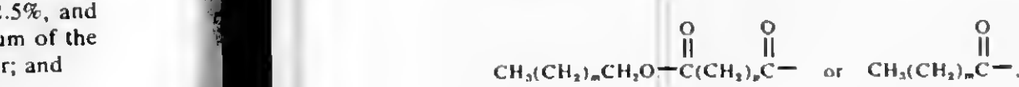
5. A plasticized vinyl polymer composition comprising

a. a vinyl polymer, and

b. incorporated with said polymer a plasticizer composition comprising condensates having the structure:



wherein *n* is from 2 to 15, D is either



A is either

m is from 2 to 10, *p* in each of said condensates is 11 or 7 or admixtures thereof, with the proviso that condensates wherein *p* is exclusively 7 are admixed with those having p equal to 11, and R and R′ are either —H or —CH_3, with the proviso that R and R′ on adjacent carbon atoms are not the same.

4,029,628

BONDING MATERIAL FOR PLANAR ELECTRONIC DEVICE

Marvin I. Fredberg, Stoughton, Mass., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed May 22, 1974, Ser. No. 472,404

Int. Cl.² C08K *5/07*

U.S. Cl. 260—32.8 R **2 Claims**

1. A composition for bonding integrated circuits to a heat sink and providing an improved thermal conduction path therebetween, said composition consisting essentially of from 2.85 to 3.15 parts by weight of an adhesive thermoplastic polymer for bonding said integrated circuit to said heat sink, said polymer having a softening point of 160° F, a flow point of 275° F,

a viscosity at said flow point of 6,000 cps, a clear amber color, and said polymer being soluble in acetone; from 2.85 to 3.15 parts by weight of a methyl ethyl ketone solvent for softening said polymer to a putty like substance; and

from 1.90 to 2.10 parts by weight of

an alumina filler for increasing the thermal conductivity of said composition for bonding integrated circuits.

4,029,629

SOLVENT RESISTANT ROOM TEMPERATURE VULCANIZABLE SILICONE RUBBER COMPOSITION

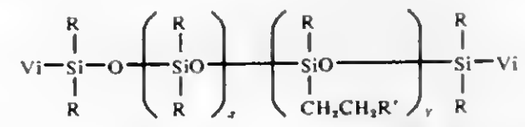
Edward M. Jeram, Burnt Hills, N.Y., assignor to General Electric Company, Waterford, N.Y.

Filed Oct. 6, 1975, Ser. No. 619,591

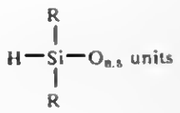
Int. Cl.² C08L *83/08;* **C08G** *77/24*

U.S. Cl. 260—37 SB **20 Claims**

1. A solvent resistant room temperature vulcanizable silicone rubber composition comprising (A) 100 parts of a vinyl-containing polymer of the formula,

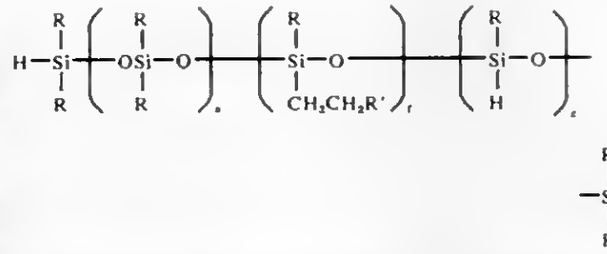


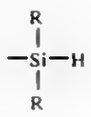
where Vi is vinyl, R is selected from the class consisting of alkyl radicals of 1 to 8 carbon atoms and phenyl, R′ is perfluoroalkyl of 1 to 8 carbon atoms, *x* and *y* are at least 1 and the viscosity of the compound varies from 1,000 to 200,000 centipoise at 25° C, and the concentration of siloxy units taken *y* times varies from 5 to 98 mole percent; (ii) from 0.1 to 50 parts per million of the total composition of a platinum catalyst, and (B) from 1 to 50 parts based on 100 parts of the mixture (A) of a cross-linking polymer selected from the class consisting of (iii) a resin having



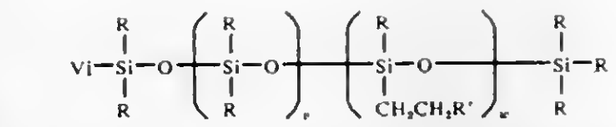
and SiO_2 units where the R to Si ratio varies from 1.0 to 2.7; (vi) a resin having

SiO_2 units and RR″ SiO units where the R to Si ratio varies from 1.2 to 2.7 and (v) a polymer of the formula





where R,R′ are as previously defined, *s* is at least 1, *t* and *z* may be zero or a positive integer and the viscosity of the polymer varies from 10 to 1000 centipoise at 25° C, where the concentration of siloxy units taken *t* times varies from 0 to 75 mole percent, and R″ is selected from the class consisting of alkyl radicals of 1 to 8 carbon atoms and —CH_2CH_2R' radicals and in (A) (vi) from 1 to 85 parts per 100 parts of polymer (i) of a vinyl-containing compound of the formula,



where, R, Vi, R′ are as previously defined; *v* and *w* are at least 1, and the concentration of the Vi $(R)_2SiO_{0.5}$ units with respect to the total terminal units in the polymer varies from 20 to 100 mole percent and the viscosity of the polymer ranges from 100 to 20,000 centipoise at 25° C.

PROCESS FOR THE MANUFACTURE OF STRUCTURAL ELEMENTS

Heinz Meinhold, Klettenbergstrasse 9, 6 Frankfurt am Main; Antonin Lev, Erzberger Strasse 15, 6056 Heusenstamm, and Vlastislav Kunopik, Bockenheimer Landstrasse 79, 6 Frankfurt am Main, all of Germany

Filed May 3, 1974, Ser. No. 466,818
Claims priority, application Germany, May 8, 1973, 2323170
Int. Cl.² C08K 3/08
U.S. Cl. 260—38 13 Claims

1. A process for manufacturing structural elements, consisting essentially of the steps of:

mixing minerals as well as low melting metallic substances selected from the group consisting of lead, aluminum, tin, Wood's metal, and an aluminum composition composed of 86% aluminum, 13% silicon, and 1% iron, to form a molding composition based on thermosetting phenolic resin; and

curing said molding composition to form such structural elements.

4,029,631
POLYESTER SHEET CONTAINING ANTIBLOCK AGENT ADDED IN DEGRADABLE POLYCARBONATE

Philip Stuart Bollen, Auburn, and Eugene Vincent Walacavage, Minersville, both of Pa., assignors to Allied Chemical Corporation, Morris Township, N.J.

Filed Nov. 3, 1976, Ser. No. 738,784
Int. Cl.² C08G 63/62; C08K 3/36
U.S. Cl. 260—40 R 31 Claims

1. A method of adding an antiblock agent to polyethylene terephthalate, said polyethylene terephthalate having an intrinsic viscosity greater than 0.9, a melt viscosity at 525° F. of above about 10,000 poise, and used to form a sheet, consisting of

a. compounding from about 0.25 to 0.01 percent by weight, based on the final total weight of all components, of said antiblock agent, said antiblock agent having a pH of less than 6, with from about 2.5 to 0.1 percent by weight, based on the final total weight of all components, of a degradable polycarbonate, said polycarbonate having an intrinsic viscosity of from about 0.55 to 0.7, before it is compounded, then

b. uniformly blending said polyethylene terephthalate and said polycarbonate to make a composition of said polyethylene terephthalate and said polycarbonate containing said antiblock agent, then

c. extruding said blended polyethylene terephthalate and polycarbonate containing antiblock agent at about 490° to 530° F. to form a sheet; and finally

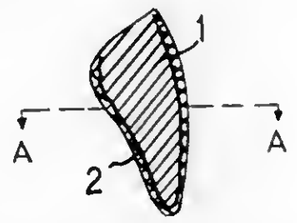
d. rapidly cooling the resulting extruded sheet with at least one cooling surface maintained at a surface temperature of from about 50° to about 160° F. for a period not exceeding about 15 seconds, said sheet being essentially amorphous and nonoriented,

so that said antiblock agent degrades said polycarbonate due to heat and acid hydrolysis during compounding of said antiblock agent with said polycarbonate, whereby said blend of polyethylene terephthalate and polycarbonate is uniform and said extruded sheet is clear.

4,029,632
PROSTHETIC DENTAL APPLIANCE

Albert Gross, Frankfurt am Main, and Roland Schaefer, Friedrichsdorf, Taunus, both of Germany, assignors to Kulzer & Co., GmbH, Bad Homburg vor der Hohe, Germany

Filed Feb. 3, 1975, Ser. No. 546,339
Claims priority, application Germany, Feb. 6, 1974, 2405578
Int. Cl.² C08K 9/06
U.S. Cl. 260—42.15 30 Claims



1. Prosthetic dental appliance comprising a shaped body portion having at least one outer surface portion having an outer surface which is adapted to be polished and which is highly resistant to abrasion, at least said outer surface portion adjacent to said outer surface comprising a hardened binder resin selected from the group consisting of methacrylate resins and acrylic acid ester resins containing between about 30% and 80% by weight of said outer surface portion of amorphous silicic acid filler particles of a maximum particle size of about 0.07 micrometer, said amorphous silicic acid being selected from the group consisting of precipitated silicic acid, and silicic acid produced by flame hydrolysis.

4,029,633
CARBON BLACK-RUBBER MASTERBATCH PRODUCTION

Erivan Hagopian, Lexington, and Allan Clark Morgan, Sudbury, both of Mass., assignors to Cabot Corporation, Boston, Mass.

Filed Apr. 14, 1976, Ser. No. 676,970
Int. Cl.² C08K 3/04
U.S. Cl. 260—42.55 7 Claims

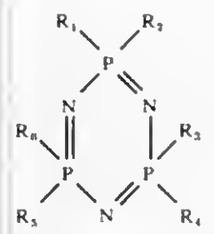
1. In a process for preparing a carbon black-rubber masterbatch wherein an aqueous carbon black slurry is mixed with a rubber latex to obtain a uniform mixture which is creamed and wherein the creamed carbon black-latex mixture is coagulated with an aqueous acidified solution to yield a rubber crumb-containing solution from which the rubber crumb is separated, washed, dried and recovered and the serum is recycled to the coagulating liquor, the improvement which comprises introducing the carbon black slurry and the latex in the form of separate continuous streams to form a uniform mixture prior to creaming the resulting carbon black-latex mixture and coagulating the resultant creamed mixture by introducing the creamed mixture in the form of at least one coherent stream into a flowing stream of acidified coagulating liquor from the periphery of the stream of coagulating liquor in a direction substantially transverse to the axis of the stream of the coagulating liquor so as to cause the stream of the creamed carbon black-latex mixture to be sheared and atomized prior to the occurrence of coagulation.

4,029,634
FLAME RETARDANT POLYMERIC COMPOSITIONS CONTAINING HALOGEN SUBSTITUTED HEXAKIS-(SUBSTITUTED PHENOXY)CYCLOTRIPHOSPHAZENE

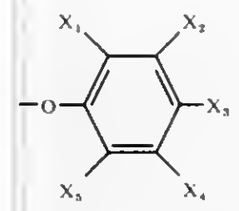
Philip Lacy Meredith, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 573,979, May 2, 1975, abandoned. This application Oct. 1, 1976, Ser. No. 728,752
Int. Cl.² C08D 3/20
U.S. Cl. 260—45.9 NP 17 Claims

1. A flame retardant polymeric composition comprising a polymer and a flame retardant effective amount of a compound of the formula:



where R_1 to R_6 has the formula



wherein X_1 to X_5 are hydrogen, bromine or chlorine, provided that at least one X is other than hydrogen and that said compound contains less than 50 ppm residual chloride ion.

4,029,635
SILICONE RESINS USEFUL FOR FORMING MICA LAMINATE

Duane F. Merrill, Ballston Spa, N.Y., assignor to General Electric Company, Waterford, N.Y.

Filed Jan. 15, 1975, Ser. No. 541,281
Int. Cl.² C08G 77/04
U.S. Cl. 260—46.5 R 4 Claims

1. A process for forming a silicone resin useful for making mica laminates consisting essentially of (a) adding a mixture of an organotrihalosilane and a dimethyldihalosilane dissolved in a water-immiscible organic solvent to a heterogeneous hydrolysis mixture consisting of water, a water-immiscible organic solvent and an alcohol of the formula R^4OH for a period of 15 minutes to 4 hours where there is present in the hydrolysis mixture per part by weight of said organotrihalosilane and dimethyldihalosilane 0.4 to 10.0 parts of the water-immiscible organic solvent, 0.2 to 1.0 parts of water and 0.5 to 1.5 parts of said alcohol; (b) continuously during and after said addition, agitating said mixture while maintaining the reaction temperature in the range of 25° C to 80° C (c) adding additional water to form two distinct separate layers, and (d) separating the solvent resin layer where said organo groups on said organotrihalosilane are methyl and phenyl where the concentration of said methyl radicals in said organotrihalosilanes varies from 30 to 70 mole percent and R^4 is selected from the class consisting of alkyl radicals haloalkyl radicals from 1 to 3 carbon atoms where the organo and methyl to Si ratio in said resin varies from 1.01 to 1 to 1.1 to 1, the alkoxy content is less than 6% and said resin has a silanol content of less than 6%.

4,029,636
METHOD FOR REDUCING MOLYBDENUM TRIOXIDE CONTENT OF GASES ISSUING FROM REACTORS CONTAINING MOLYBDENUM-BASED CATALYSTS

Richard P. Lowry; Joseph D. Chase, both of Corpus Christi, Tex., and Paul A. C. Cook, Mendham, N.J., assignors to Celanese Corporation, New York, N.Y.

Filed Nov. 12, 1974, Ser. No. 523,195
Int. Cl.² C07C 51/32
U.S. Cl. 260—530 N 8 Claims

1. In a process which comprises passing a gas comprising propylene or isobutylene admixed with water vapor, oxygen, and an inert diluent gas through a reaction zone which is maintained at an elevated temperature of about 300° C to 500° C and at a pressure of about 1 to 5 atmospheres absolute and which contains a solid catalyst comprising a molybdenum oxide or a metal molybdate salt which is a source of molybdenum trioxide under the conditions obtaining within said reaction zone, and (b) introducing the gaseous effluent from said reaction zone into a subsequent processing step or zone in which unsaturated aldehydes contained in said effluent are further oxidized with oxygen to the corresponding alkenoic acids at a temperature of approximately 240° to 300° C in the presence of a solid catalyst, the improvement which comprises:

cooling said reaction zone effluent gas by approximately 5° C to 200° C, prior to introducing it into said subsequent processing step or zone, by passing said effluent gas through a cooled bed or array of solid bodies which are chemically inert toward said gas, said bed or array having an effective void space greater than about 40%:

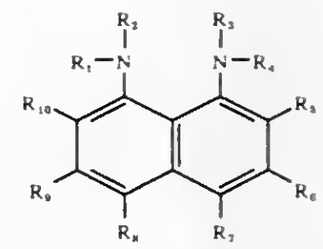
and condensing varpors of molybdenum trioxide contained in said effluent gas as a result of vaporization of molybdenum trioxide from said reaction zone catalyst upon the surfaces of said solid bodies to diminish the molybdenum trioxide content of said gaseous effluent priot to its entry into said second subsequent processing step or zone.

4,029,637
ACID DYEABLE POLYESTER CONTAINING 1,8-BIS-(DIALKYL-AMINO)NAPHTHALANE

Doetze J. Sikkema, Duiven, Netherlands, assignor to Akzona Incorporated, Asheville, N.C.

Filed Mar. 6, 1975, Ser. No. 556,064
Claims priority, application Netherlands, Mar. 22, 1974, 7403884
Int. Cl.² C08G 63/76, 63/02
U.S. Cl. 260—75 N 8 Claims

1. A filament-forming polyester comprising at least 80 mole % of repeating structural units of ethylene terephthalate in which is incorporated 0.001 – 10 mole % of a derivative of 1,8-diamino naphthalene of the following formula:



wherein R_1 and R_4 represent an alkyl group with 1 – 4 C atoms and R_3 and R_{10} an H atom, an alkyl group, or an aralkyl group.

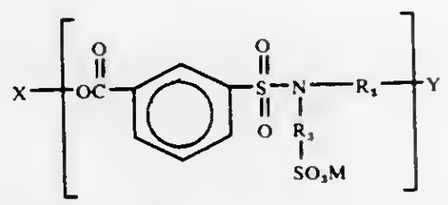
4,029,638

COPOLYESTER POLYMER OF ENHANCED DYEABILITY

Gerald W. McNeely, Arden, N.C., assignor to Akzona Incorporated, Asheville, N.C.

Filed Apr. 28, 1975, Ser. No. 572,025
Int. Cl.² C08G 63/76
U.S. Cl. 260—75 N 29 Claims

13. Copolyester polymer having from about 0.5 to about 10 mole percent comonomer dye sensitizing units containing sulfonamide groups as an intralinear part of the polymer chain, said copolymer having the formula:



wherein R_2 and R_3 are alkylene radicals of from 1 to about 6 carbons, M is selected from the group consisting of alkaline earth metals and alkali metals, X is a radical remaining after the removal of a hydroxyl group from a polyester unit and Y is a radical remaining after the removal of a hydrogen atom from a carboxyl group of a polyester unit.

4,029,639

TREATED FABRICS AND PROCESS

James T. Gragson, Bartlesville, Okla., and Joseph E. Ballard, Greenville, S.C., assignors to Phillips Petroleum Company, Bartlesville, Okla.

Filed June 30, 1975, Ser. No. 591,921
Int. Cl.² C08G 75/16
U.S. Cl. 260—79 7 Claims

1. An article of manufacture comprising a water-repellent fabric of phenylene sulfide polymer fibers produced from polymers having a melt flow within the range of 75 to 800 grams per 10 minutes as measured by ASTM method D-1238-70 modified to operate at 650° F with a piston load of 5 kilograms which has been heat treated in a relaxed state at a temperature near, but below, the melting point of the polymer for a finite period of time sufficient to render the fabric water-repellent.

4,029,640

PROCESS FOR PRODUCING AMMONIUM AROMATIC SULFONATE

Tatsuo Hattori; Kanzi Katsuragawa; Keiichi Kihara; Isao Ono, and Hanzo Tamabayashi, all of Shin-nanyo, Japan, assignors to Toyo Soda Manufacturing Co., Ltd., Japan

Filed May 27, 1975, Ser. No. 580,937
Claims priority, application Japan, May 27, 1974, 49-58858
Int. Cl.² C07C 143/24; C09K 13/06
U.S. Cl. 260—79.3 MU 8 Claims

1. A process for producing an ammonium p-styrenesulfonate or polymer thereof which comprises:

reacting an alkali metal p-styrenesulfonate or a polymer thereof with an inorganic ammonium salt, in a medium of a hydrophilic alcohol, or a mixture of a hydrophilic organic solvent and water, wherein when said medium is a mixture of a hydrophilic organic solvent and water, the weight ratio of the amount of said solvent to the amount of water is from 1.0 to 10.

4,029,641

PROCESS FOR THE SIMULTANEOUS OBTENTION OF INSULIN AND PANCREATIN FROM SWINE PANCREASES

Leonhard Hafner, Konigstein, Taunus; Wilhelm Schramm, Kelkheim, Taunus; Hans Kargl, Schwalbach, Taunus, and Friedrich Kieser, Eppstein, Taunus, all of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Dec. 18, 1975, Ser. No. 641,927
Claims priority, application Germany, Dec. 20, 1974, 2460334
Int. Cl.² C07C 103/52
U.S. Cl. 260—112.7 5 Claims

1. A method for treating fresh or deep frozen swine pancreases simultaneously to obtain therefrom an insulin-containing material and a pancreatin-containing material, which method comprises extracting said pancreases with an aqueous extractant containing at least 40 percent by volume of acetone and having dissolved therein a first soluble salt the cation of which reacts with acidic substances accompanying the insulin to form undissociated compounds therewith while releasing hydrogen ions therefrom to establish a pH of about 5 to 7 in the pancreas-extractant combination, separating the extract and remaining solids after the extraction, and instantly adjusting the pH of the resulting solids to a pH above 5.6 by combining them with a buffer, whereby the extract so obtained is an insulin-containing material from which insulin can be isolated and the solids so obtained are a pancreatin-containing material.

4,029,642

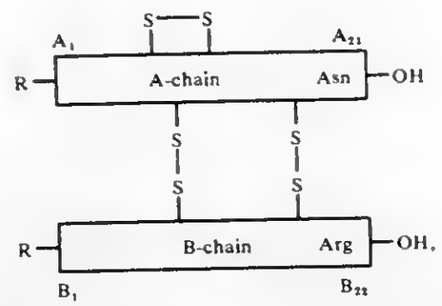
PROCESS FOR THE MANUFACTURE OF HUMAN INSULIN

Rainer Obermeier, Hattersheim, Main, Germany, assignor to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Filed Dec. 19, 1975, Ser. No. 642,399
Claims priority, application Germany, Dec. 21, 1974, 2460753
Int. Cl.² C07C 103/52
U.S. Cl. 260—112.7 1 Claim

1. A method for making human insulin, which comprises condensing des-B_{23-30}-octapeptide porcine insulin of the formula

(I)



wherein R is an amino-protective group which is tert.-butyloxy-carbonyl, tert.-amyloxy-carbonyl, or methylsulfonyl-ethyloxy-carbonyl with a peptide of the formula

H—Gly—Phe—Phe—Tyr(X)—Thr(X)—Pro—Lys(-BOC)—Thr(Bu^t)OBu^t,

wherein X is hydrogen or tert.-butyl, in the presence of dicyclohexyl carbodiimide and hydroxybenzotriazole, and then splitting off said amino-protective group with alkali if said group is methylsulfonyl-ethyloxy-carbonyl or with trifluoroacetic acid if said protective group is tert.-butyloxy-carbonyl or tert.-amyloxy-carbonyl.

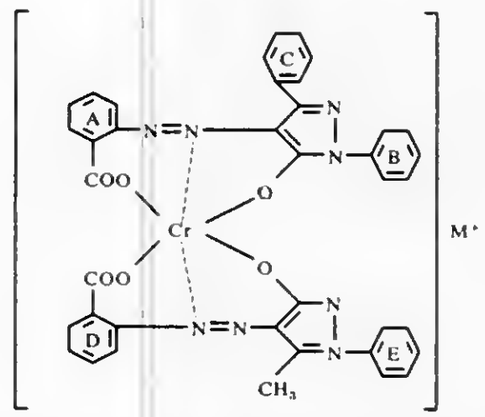
4,029,643

CHROMIUM CONTAINING AZO DYES

Yoichi Koiso, Yono; Koji Ito, Tokyo, and Hiroshi Seno, Omiya, all of Japan, assignors to Nippon Kayaku Kabushiki Kaisha, Tokyo, Japan

Filed May 19, 1972, Ser. No. 255,134
Claims priority, application Japan, May 29, 1971, 46-36713
Int. Cl.² C09B 45/48
U.S. Cl. 260—145 B 12 Claims

1. A chromium containing azo dye of the general formula:



wherein one of the phenyl nuceli A, B, D and E is substituted by sulfonic acid group, the nuclei A, B, C, D and E may be substituted by one or more substituents selected from the group consisting of chlorine atom, bromine atom, nitro group, lower alkoxy group and lower alkyl group and M is an alkali metal.

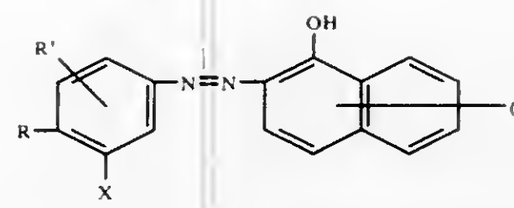
4,029,644

WATER-SOLUBLE, FIBER-REACTIVE MONOAZO DYESTUFFS

Fritz Meininger, Frankfurt am Main, and Ludwig Schläfer, Fischbach, Taunus, both of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

Continuation-in-part of Ser. No. 386,608, Aug. 8, 1973, abandoned, which is a continuation-in-part of Ser. No. 98,902, Dec. 16, 1970, abandoned. This application Nov. 6, 1975, Ser. No. 629,677
Claims priority, application Germany, Dec. 19, 1969, 1963673
Int. Cl.² C09B 29/16
U.S. Cl. 260—200 6 Claims

I. A water-soluble monoazo dyestuff of the formula



wherein R represents lower alkyl or lower alkoxy, R′ represents hydrogen, lower alkyl or lower alkoxy, X represents $-SO_2-CH_2-CH_2-OH$, $-SO_2-CH_2-CH_2-O-SO_3H$, $-SO_2-CH_2-CH_2-O-PO_3H_2$, $-SO_2-CH_2-CH_2-S-SO_3H$ or $-SO_2-CH_2-CH_2-N(\text{lower alkyl})_2$, and n stands for the integer 1, 2 or 3.

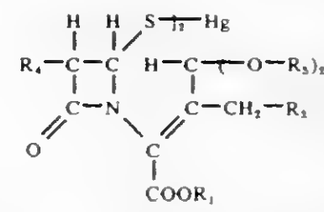
4,029,645

MERCURY INTERMEDIATES USEFUL IN THE PREPARATION OF 2-ALKOXY CEPHALOSPORINS

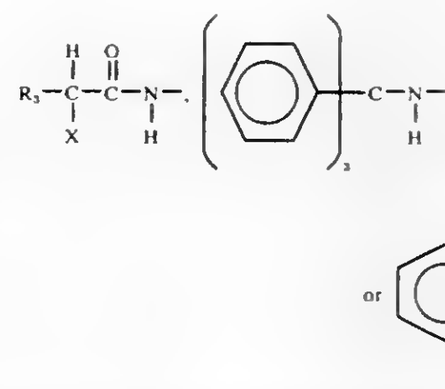
William A. Slusarchyk, Belle Mead, and Christopher M. Cimarusti, Hamilton, both of N.J., assignors to E. R. Squibb & Sons, Inc., Princeton, N.J.

Filed Nov. 17, 1975, Ser. No. 632,617
Int. Cl.² C07D 205/08
U.S. Cl. 260—239 A 9 Claims

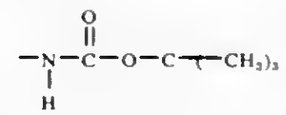
1. A compound of the formula:

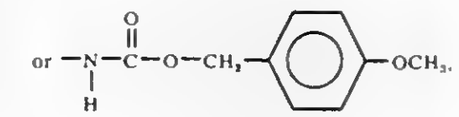


wherein R_1 is lower alkyl, diphenylmethyl, 2,2,2-trichloroethyl, p-methoxybenzyl, or p-nitrobenzyl; R_2 is hydrogen or acetoxy; R_3 is lower alkyl; and R_4 is

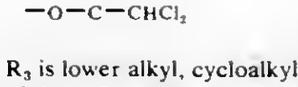


wherein X is hydrogen, protected amino of the formula





or protected hydroxy of the formula



and R_3 is lower alkyl, cycloalkyl of 3 to 7 carbons, cycloalkenyl of 3 to 7 carbons, cycloalkadienyl of 6 to 7 carbons, phenyl, phenoxy, phenyllower alkyl, substituted phenyl wherein said substituent is one or two members selected from the group consisting of lower alkyl, lower alkoxy, and halogen, or heterocyclic wherein said heterocyclic is attached by way of an available carbon atom and is unsubstituted or substituted at an available carbon atom by a lower alkyl or halogen group and is selected from the group consisting of thienyl, furyl, pyrryl, pyridyl, thiazolyl, isothiazolyl, oxazolyl, isoxazolyl, thiadiazolyl and tetrazolyl provided that X is protected amino or protected hydroxy only when R_3 is phenyl, substituted phenyl or cycloalkadienyl.

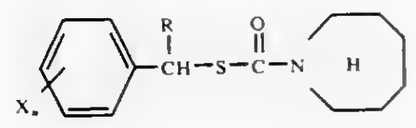
4,029,646

BENZYL N,N-HEXAMETHYLENETHIOLCARBAMATE COMPOUNDS AND HERBICIDAL COMPOSITIONS

Masahiro Aya; Masao Miyamoto; Nobuo Fukazawa, and Masaaki Yamagishi, all of Tokyo, Japan, assignors to Bayer Aktiengesellschaft, Leverkusen, Germany

Filed Feb. 9, 1971, Ser. No. 114,031
Claims priority, application Japan, Feb. 14, 1970, 50-12463
Int. Cl.² C07D *295/10*
U.S. Cl. 260—239 BF **23 Claims**

1. Thiolcarbamic acid ester compound of the formula



wherein
X is lower alkyl, lower alkoxy or halogen;
R is hydrogen or methyl; and
n is an integer from 0 to 3;
with the proviso that when R is hydrogen, *n* is an integer of from 1 to 3 and at last one X is alkyl or alkoxy.

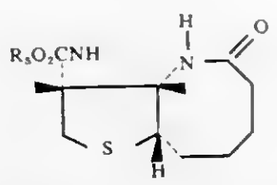
4,029,647

SYNTHESIS OF BIOTIN

Pasquale Nicholas Confalone, Bloomfield; Milan Radoje Uskokovic, Upper Montclair, and Giacomo Pizzolato, Belleville, all of N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J.

Division of Ser. No. 421,460, Dec. 3, 1973, Pat. No. 3,978,084. This application May 12, 1976, Ser. No. 685,835
Int. Cl.² C07D *493/04*
U.S. Cl. 260—239.3 B **2 Claims**

1. A compound of the formula:



wherein R_5 is a straight or branched chain aliphatic hydrocarbyl group having from 1–20 carbon atoms; a cycloaliphatic group selected frum the group consisting of menthyl, bornyl and cholesteryl and aryl lower alkyl groups wherein the aryl moiety is selected from the group consisting of phenyl, tolyl, naphthyl, phenanthryl and azulyl wherein said aryl moieties may be unsubstituted or substituted with lower alkylenedioxy, halogen, lower alkyl, lower alkoxy or a nitro group and the lower alkyl moiety is a straight or branched chain alkyl group having 1 to 8 carbon atoms.

4,029,648

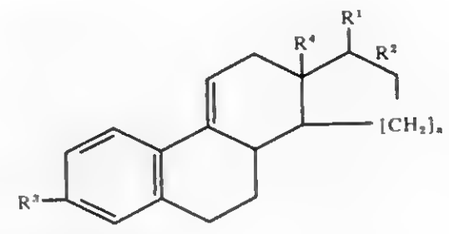
PROCESS OF MAKING GONA-1,3,5(10),9(11)-TETRAENES

Kurt Ponsold, and Helmut Kasch, both of Jena, Germany, assignors to VEB Jenapharm, Jena, Germany

Filed Jan. 15, 1976, Ser. No. 649,465
Int. Cl.² C07J *17/00*
U.S. Cl. 260—239.55 R **9 Claims**

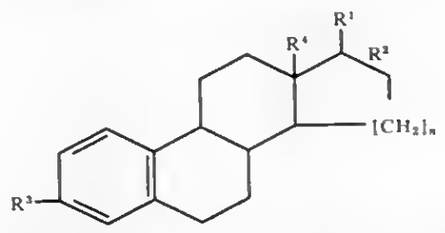
1. A process for the production of a gona-1,3,5(10),9(11)-tetraene having the formula

I



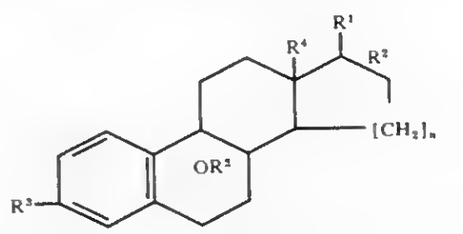
in which formula
n is 1 or 2,
R^1 is hydrogen, hydroxyl, alkoxy, alkanoyl or acetyl,
R^2 is hydrogen, alkoxy, acetoxy, alkenyl, alkinyl, or alkyl or is $—CH_2X$ in which X is halogen, cyano or alkoxy,
or R^1 and R^2 together are oxo, methyleneoxy, or ethylenedioxy,
R^3 is hydroxyl, alkoxy of up to 4 carbon atoms, alkanoyl or alkoxymethyleneoxy, and
R^4 is methyl or ethyl,
which process comprises the steps of electrolyzing a gona-1,3,5(10)-triene having the formula

II



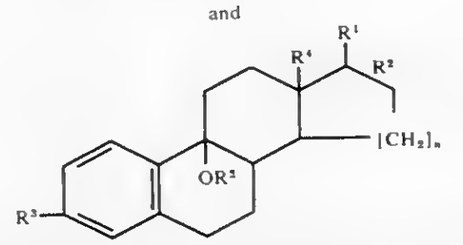
in which formula *n*, R^1, R^2, R^3, and R^4 have the same significance as hereinbefore, while dissolved or suspended in water or a primary or secondary alcohol or a mixture thereof, in the presence of an electroconductive salt which is non-reactive, under the conditions of the electrolysis with the gona-1,3,5(10)-triene, the cationic moieties of said electroconductive salts being ions of the alkali or alkaline-earth metals or cations of other metals and oxonium salts of elements of Groups V and VI of the Periodic Table, and the anionic moieties of the electroconductive salts being fluoborate, sulfate, perchlorate, arylsulfonate, alkylsulfonate, alkoxide, hexafluorophosphate, hydroxyl, nitrate, or carboxyl ions and the said electrolysis being conducted at a constant current or constant voltage until the conversion of the gona-1,3,5(10)-triene is complete so as to form a mixture of 9α and 9β-hydroxy or alkoxygona-1,3,5(10)-trienes having the respective formulae

IIIa



and

IIIb



in which *n*, R^1, R^2, R^3, and R^4 have the same significance as hereinbefore, and R^5 depending on the solvent or suspension medium is hydrogen in case of water and is the corresponding alkyl group in case of an alcohol, and subsequently converting the said 9α or 9β-hydroxy or alkoxygona-1,3,5(10)-triene by means of an acid reagent to a gona-1,3,5(10),9(11)-tetraene.

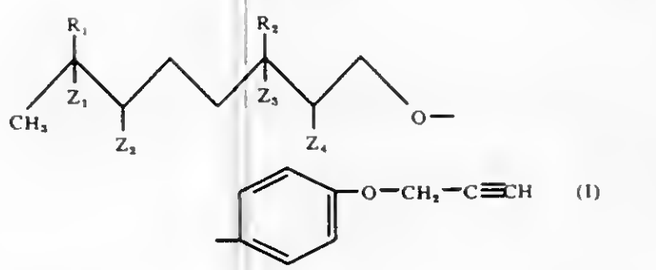
4,029,649

TERPENE ARYL ESTERS

Friedrich Karrer, Basel, Switzerland, assignor to Ciba-Geigy Corporation, Ardsley, N.Y.

Continuation-in-part of Ser. No. 190,307, Oct. 18, 1971, abandoned. This application May 16, 1973, Ser. No. 360,853
Claims priority, application Switzerland, Oct. 20, 1970, 15436/70; Aug. 23, 1971, 12321/71
The portion of the term of this patent subsequent to Apr. 13, 1993, has been disclaimed.
Int. Cl.² C07D *303/28*
U.S. Cl. 260—240 H **6 Claims**

1. a compound of the formula



(I)

wherein
Z_1 and Z_2 together are an oxygen bridge,
R_1 and R_2 are each methyl or ethyl, and
Z_3 and Z_4 together form a carbon-carbon-bond or are each hydrogen

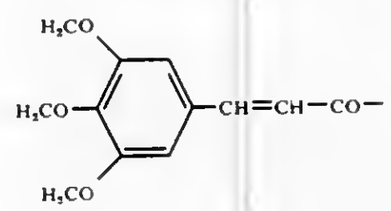
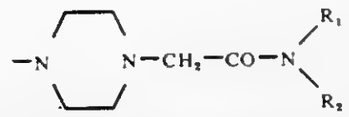
NOVEL DERIVATIVES OF N-(3,4,5-TRIMETHOXY CINNAMOYL)PIPERAZINE AND THE PROCESS FOR PREPARING THEM

Guy M. Raynaud, Paris; Bernard M. Pourrias, Meudon-la-Foret; Claude P. Fauran, and Michel J. Turin, both of Paris, all of France, assignors to Delalande S. A., Courbevoie, France

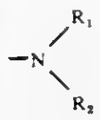
Filed Nov. 20, 1975, Ser. No. 633,932
Claims priority, application France, Nov. 20, 1974, 74.38203; Sept. 29, 1975, 75.29782
Int. Cl.² C07D *241/02, 403/06*
U.S. Cl. 260—240 J **8 Claims**

1. A compound having the formula





in which R_1 is alkyl having one to 4 carbon atoms and R_2 is dimethoxyphenylethyl, or



is piperidino, heptamethylenimino or 1,2,3,4-tetrahydro isoquinolino,
and the pharmacologically acceptable acid addition salts thereof.

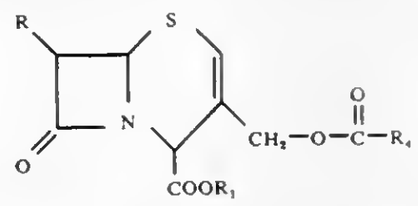
4,029,651

PROCESS FOR PREPARING 3-ACYLOXYMETHYL-2-CEPHEM COMPOUNDS

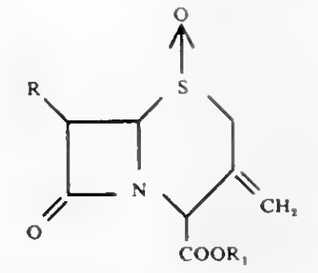
Gary A. Koppel, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind.

Filed Jan. 19, 1976, Ser. No. 650,583
Int. Cl.² C07D *501/04*
U.S. Cl. 260—243 C **13 Claims**

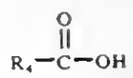
1. A process for preparing a compound of the formula



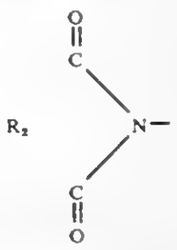
which comprises reacting a 3-exomethylenecepham sulfoxide of the formula



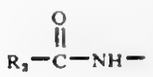
with a mixture of a carboxylic acid of the formula



and the corresponding anhydride of said carboxylic acid at a temperature of from about 70° C. to about 130° C., in which, in the above formulae, R_4 is C_1–C_4 alkyl, R_1 is a carboxylic acid protecting group, and R is
1. an imido group of the formula



in which R_2 is C_2-C_4 alkenylene or 1,2-phenylene;
2. an amido group of the formula

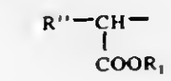


in which R_3 is
a. hydrogen, C_1–C_3 alkyl, halomethyl, benzyloxy, 4-nitrobenzyloxy, 2,2,2-trichloroethoxy, 4-methoxybenzyloxy, 3-(2-chlorophenyl)-5-methyl-isoxazol-4-yl;
b. the group R′ in which R′ is phenyl or phenyl substituted

with 1 or 2 halogens, nitro, cyano, trifluoromethyl, C_1–C_4 alkyl, or C_1–C_4 alkoxy;

c. a group of the formula $R'-(O)_m-CH_2-$ in which R' is as defined above and m is 0 or 1;

d. a group of the formula

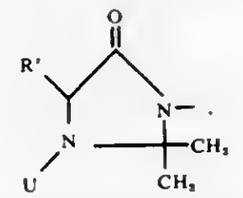


in which

R'' is R' as defined above, 2-thienyl, or 3-thienyl, and R_1 is as defined above; or

e. a group of the formula R'''—CH_2- in which R''' is 2-thienyl, 3-thienyl, 2-furyl, 3-furyl, 2-thiazolyl, 5-tetrazolyl, 1-tetrazolyl, or 4-isoxazolyl; or R is

3. an imidazolidinyl group of the formula



in which R' is as defined above and U is nitroso or acetyl.

4,029,652

TETRAHYDRO-3-(4-PYRIDYLMETHYL)-2H-1,3,5-THIADIAZINE-2-THIONE

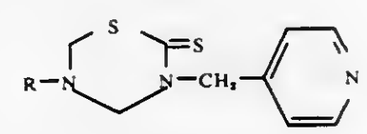
Thomas Andrew Lies, Princeton, and Herman Berenson, Trenton, both of N.J., assignors to American Cyanamid Company, Stamford, Conn.

Filed Mar. 10, 1976, Ser. No. 665,656

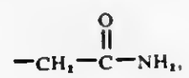
Int. Cl.² C07D *285/34*

U.S. Cl. 260—243 R **5 Claims**

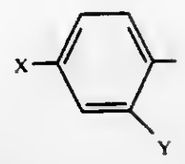
1. A compound of formula:



wherein R is selected from the group consisting of alkyl C_1–C_{12}, $-CH_2COOH$, $-CH_2COONa$,



and the radical:



wherein X is selected from the group consisting of hydroxy, hydroxy and chloro, Y is selected from group consisting of hydrogen and methyl.

4,029,653

7-METHOXY 7-ALPHA-UREIDOTHIENYLACETAMIDOCEPHALOSPORINS

Joseph Edward Dolfini, Princeton, N.J., assignor to E. R. Squibb & Sons, Inc., Princeton, N.J.

Division of Ser. No. 390,838, Aug. 23, 1973, Pat. No. 3,978,051. This application May 19, 1976, Ser. No. 687,585

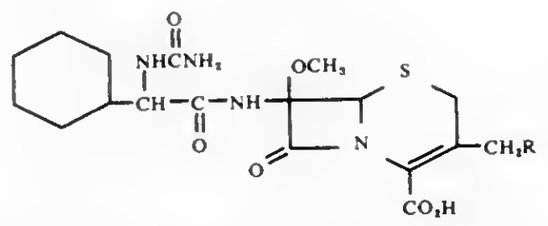
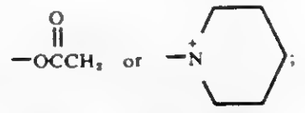
1. A compound of the formula

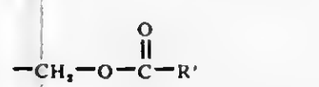


wherein the 7-methoxy group is in the α-configuration; R is H,



and a pharmaceutically acceptable salt thereof, a straight or

branched chain alkyl ester of 1 to 3 carbon atoms thereof, or an acyloxymethyl ester thereof having the formula



wherein R' is lower alkyl of 1 to 5 carbons, phenyl, benzyl or phenethyl.

4,029,655

METHOD OF PREPARING STABLE STERILE CRYSTALLINE CEPHALOSPORINS FOR PARENTERAL ADMINISTRATION

Michael D. Cise, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind.

Filed Apr. 11, 1975, Ser. No. 567,224

Int. Cl.² C07D *501/12*

U.S. Cl. 260—243 C **11 Claims**

1. A method of preparing a sterile, essentially crystalline cephalosporin selected from the group consisting of cephalothin sodium, cephaloridine betaine and cefazolin sodium for reconstitution for parenteral administration comprising the steps of:

a. dissolving said cephalosporin in water;

b. filtering the solution from (a) through a sterilizing filter;

c. cooling the sterile filtrate from (b) rapidly to a temperture below at least −15° C. within an interval not longer than 3 hours;

d. warming the preparation from (c) to between <0° C. and about −10° C.;

e. maintaining the temperature of the preparation from (d) between <0° C. and about −10° C. until the nucleation of the crystals of said cephalosporin is substantially complete;

f. reducing the pressure of the environment in which the preparation from (e) is maintained to a maximum of 1mm absolute;

g. raising the temperature of the environment in which the preparation from (f) is maintained to a maximum of about 50° C., avoiding the melting of such preparation; and

h. subliming the water from the preparation from (g) until the resulting crystals of said cephalosporin have a moisture content of no more than 6.0 percent.

4,029,656

7-(α-SULFOACYLAMIDO) CEPHALOSPORANIC ACIDS

Toshihiro Ishiguro, Suita; Takeshi Fugono, Kawanishi, and Hiroaki Nomura, Mino, all of Japan, assignors to Takeda Chemical Industries, Ltd., Japan

Division of Ser. No. 547,169, Feb. 5, 1975, Pat. No. 3,988,327, which is a continuation of Ser. No. 113,935, Feb. 9, 1971, abandoned. This application Aug. 4, 1976, Ser. No. 711,565

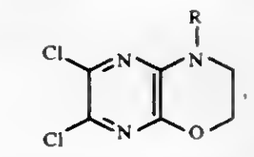
1. A dichloropyrazino-oxazine of the formula:



wherein R is H, alkyl of 1–8 carbons, alkenyl of 2–8 carbons, cycloalkyl of 3–8 carbons or a cycloalkenyl radical of 4 to 8 carbons.

4,029,658

MONOMERIC MORPHOLINIUM EMULSION STABILIZERS

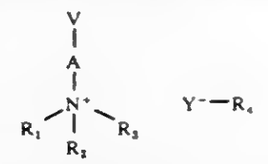
Carlos M. Samour, Wellesley Hills, Mass., assignor to The Kendall Company, Walpole, Mass.

Division of Ser. No. 452,073, March 18, 1974, Pat. No. 3,925,442, which is a continuation of Ser. No. 110,588, Jan. 28, 1971, abandoned, which is a continuation-in-part of Ser. No. 769,355, Oct. 21, 1968, abandoned. This application June 2, 1975, Ser. No. 582,685

Int. Cl.² C07D *295/00*

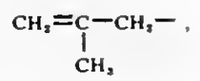
U.S. Cl. 260—247.1 E **2 Claims**

1. A monomeric emulsion stabilizer capable of stabilizing the polymerization of ethylenically-unsaturated monomers in a copolymerization reaction, corresponding to the formula:



wherein

V-A is selected from the group consisting of allyl, $CH_2{=}CH{-}CH_2-$ and methallyl,



R_1, R_2, and R_3 are selected from the class consisting of compounds wherein R_1 is an alkyl group of from 1 to 4 carbon atoms and R_2, R_3 are valence bonds of a morpholine ring,

and Y^- R_4 is an anionic group selected from the class consisting of alkyl sulfates wherein the alkyl group contains from 8 to 28 carbon atoms, and alkylphenoxypolyethyleneoxy ethanol sulfates of the formula

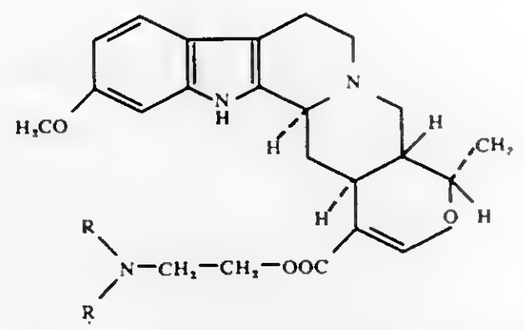
wherein
m is 0 to 40 and the alkyl group L contains from 8 to 28 carbon atoms.

4,029,659
N-DISUBSTITUTED AMINOETHYL ESTERS OF 11-METHOXY-RAUBASINIC ACID

Jean Alfred Alphonse Joseph Hannart, Brussels, Belgium, assignor to Omnium Chimique Societe Anonyme, Brussels, Belgium

Continuation of Ser. No. 238,818, March 28, 1972, abandoned. This application July 22, 1974, Ser. No. 490,436
Claims priority, application Belgium, Mar. 29, 1971, 764950; Mar. 17, 1972, 115227
Int. Cl.² C07D *491/22*
U.S. Cl. 260—247.2 B **9 Claims**

1. N-disubstituted aminoethyl ester of 11-methoxy-raubasinic acid of the formula :



in which R is an alkyl group containing up to 4 carbon atoms or the two R groups, together with the nitrogen atom to which they are attached, form a morpholinyl, piperidinyl, piperazinyl or pyrrolidinyl group, and their physiologically acceptable acid addition salts.

4,029,660
CRUDE CYANURIC ACID PURIFICATION

Sidney Berkowitz, Highland Park, N.J., assignor to FMC Corporation, Philadelphia, Pa.

Division of Ser. No. 511,447, Oct. 2, 1974, Pat. No. 3,969,352. This application Mar. 5, 1976, Ser. No. 664,244
Int. Cl.² C07D *251/32*
U.S. Cl. 260—248 A **4 Claims**

1. A novel free-flowing cyanuric acid composition having at least 90% cyanuric acid crystals with particle sizes between 700 and 800 microns and containing about 0.001% to about 0.1% sulfate values produced by a process for purifying crude cyanuric acid which comprises:

a. mixing in water sufficient amounts of crude cyanuric acid and a mono-substituted salt of a dibasic inorganic acid selected from the group consisting of ammonium bisulfate, sodium bisulfate and potassium bisulfate, to form a 10% to 25% crude cyanuric acid slurry containing about 10% to about 30% of said mono-substituted salt of a dibasic inorganic acid;
b. heating the slurry for about 15 seconds to about 10 minutes at a temperature of about 190° C to about 205° C under at least the autogenously developed pressure to digest the crude cyanuric acid impurities;
c. cooling the digested cyanuric acid slurry to precipitate the cyanuric acid crystals; and
d. recovering said cyanuric acid crystals from the digestion solution.

4,029,661
PROCESS FOR PRODUCING 5-FLUOROURACIL AND DERIVATIVES THEREOF IN ACID AND/OR ALCOHOL SOLVENTS

Paul D. Schuman, Hawthorne; Geraldine Westmoreland, and Roy Anderson, both of Gainesville, all of Fla., assignors to PCR, Inc., Gainesville, Fla.

Continuation-in-part of Ser. No. 186,443, Oct. 4, 1971. This application July 13, 1972, Ser. No. 271,489
Int. Cl.² C07D *239/54*
U.S. Cl. 260—256.4 C **24 Claims**

1. A process for the fluorination of pyrimidines, said process consisting essentially of reacting, in a solvent of the formula:

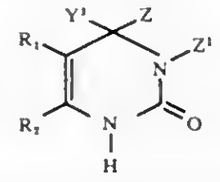
$CX''_2Y''—(CY''_2)_n—COOH$

or

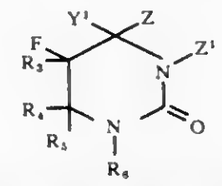
$CX_2Y—(CY_2)_n—CH_2OH$,

wherein X and Y are independently hydrogen, bromine, chlorine or fluorine, X'' and Y'' are independently bromine, chlorine, or fluorine, and *n* is an integer from 0 to 6,

at a temperature of about the solvent freezing point to about the solvent boiling point, a pyrimidine of the formula



with at least about a stoichiometric amount of gaseous fluorine to produce a compound of the formula:



wherein R_1 is hydrogen, fluorine, chlorine, bromine or lower alkyl, R_2 is hydrogen or lower alkyl, R_3 is R_1 or, taken with R_5, a 5,6-double bond, R_4 is hydrogen or lower alkyl, R_5 is

$CX_2Y—(CY_2)_n—CH_2O—$,

$CX''_2Y''—(CY''_2)_n—COO—$,

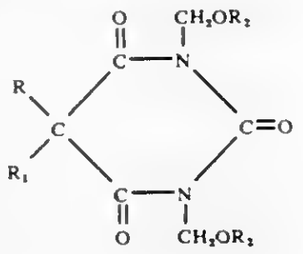
a 5,6-double bond when taken with R_3, or a 1,6-double bond when taken with R_6, R_6 is hydrogen or a 1,6-double bond when taken with R_5, Y^1 is $-NH_2$ and Z and Z^1 together are a 3,4-double bond or else Y^1 and Z taken with the 4-carbon atom, are carbonyl and Z^1 is hydrogen.

4,029,662
METHOD OF MAKING BARBITURIC ACID DERIVATIVES

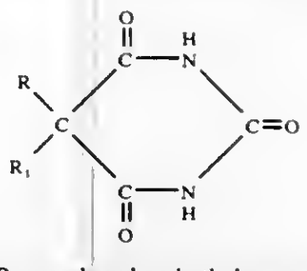
Julius A. Vida, Greenwich, Conn., assignor to Bristol-Myers Company, New York, N.Y.

Filed Apr. 30, 1976, Ser. No. 682,178
Int. Cl.² C07D *239/62*
U.S. Cl. 260—257 **7 Claims**

1. A process for the preparation of a barbituric acid derivative having the formula:



wherein R and R_1 are phenyl and ethyl respectively, or R and R_1 are individually or both alkyl or alkenyl, having 2 to 5 carbon atoms or cycloalkenyl having 5 to 7 carbon atoms, and each R_2 is the same and is an alkyl group having from 1 to 4 carbon atoms or benzyl, which process comprises reacting in one step a 5,5-disubstituted barbituric acid having the formula:



wherein R and R_1 are phenyl and ethyl respectively, or R and R_1 are individually or both alkyl or alkenyl, having 2 to 5 carbon atoms or cycloalkenyl having 5 to 7 carbon atoms, with at least 2 moles of a dialkoxymethane or a dibenzyloxymethane per mole of said barbituric acid and an at least equimolar amount of anhydrous stannic chloride based on the amount of said barbituric acid.

4,029,663
DIMERIC ANHYDRO-VINCA DERIVATIVES

Gerald E. Gutowski, and Jean C. Miller, both of Indianapolis, Ind., assignors to Eli Lilly and Company, Indianapolis, Ind.

Filed July 10, 1975, Ser. No. 594,915
Int. Cl.² C07D *519/04*

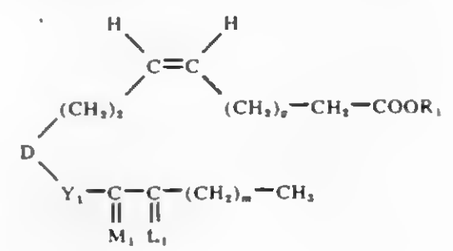
PROCESS FOR THE PREPARATION OF DIAMINO-DIHYDROXY ANTHRAQUINONE DISPERSE DYESTUFFS
Günter Gehrke, Cologne, and Reinold Schmitz, Blecher, both of Germany, assignors to Bayer Aktiengesellschaft, Leverkusen, Germany
Filed July 25, 1975, Ser. No. 599,017
Claims priority, application Germany, Aug. 3, 1974, 2437523
Int. Cl.² C07C *97/26*
U.S. Cl. 260—380 **13 Claims**

1. Process for the preparation of anthraquinone disperse dyestuffs from aqueous solutions containing anthraquinone sulfonic acid mixtures comprising

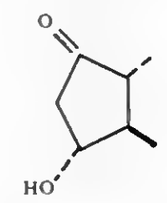
a. treating anthraquinone sulfonic acid waste waters arising from the sulfonation of anthraquinone by the Fischer treatment comprising halogenation with bromine or activated chlorine to form sparingly soluble halogenoanthraquinones;
b. isolating and dinitrating the halogenoanthraquinones to form dinitro halogenoanthraquinones;
c. warming the dinitro halogenanthraquinones with elementary sulfur in sulfuric acid having an SO_3 content of 0 to 20% at temperatures of from 70–170° C to obtain diaminodihydroxy anthraquinone derivatives.

4,029,681
13,14-DIDEHYDRO-PG ANALOGS
Herman W. Smith, Kalamazoo, Mich., assignor to The Upjohn Company, Kalamazoo, Mich.
Filed Feb. 13, 1976, Ser. No. 657,739
Int. Cl.² C07C *177/00*
U.S. Cl. 260—408 **73 Claims**

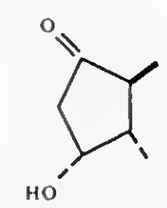
1. A prostaglandin analog of the formula:



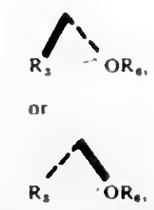
wherein O is



or

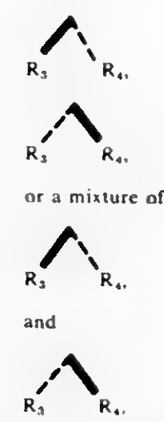


wherein Y_1 is $-C\equiv C-$;
wherein g is one, two, or 3;
wherein m is one to 5, inclusive;
wherein M_1 is



wherein R_5 and R_6 are hydrogen or methyl, with the proviso that one of R_5 and R_6 is methyl only when the other is hydrogen;

wherein L_1 is



wherein R_3 and R_4 are hydrogen, methyl, or fluoro, being the same or different, with the proviso that one of R_3 and R_4 is fluoro only when the other is hydrogen or fluoro;

wherein R_1 is hydrogen, alkyl of one to 12 carbon atoms, inclusive, cycloalkyl of 3 to 10 carbon atoms, inclusive, aralkyl of 7 to 12 carbon atoms, inclusive, phenyl, phenyl substituted with one, two, or three chloro or alkyl of one to 3 carbon atoms, inclusive, or a pharmacologically acceptable cation.

4,029,682
SOAPS AND ESTER-SOAPS OF α-OLEFIN DERIVED HIGH MOLECULAR WEIGHT ACIDS
Harold C. Foulks, Jr., Newport, Ky., assignor to Emery Industries, Inc., Cincinnati, Ohio
Filed Dec. 23, 1974, Ser. No. 535,603
Int. Cl.² C07C *51/09, 51/00;* **C08K** *5/09;* **C11C** *3/02*
U.S. Cl. 260—414 **10 Claims**

1. A soap of a mixed straight-chain aliphatic monocarboxylic acid obtained by the ozonization of a C_{22+} α-olefin wherein at least 90% by weight of the olefins contain 22 or more carbon atoms, said mixed acid containing less than 30% by weight acids having fewer than 21 carbon atoms, less than 20% by weight acids having greater than 35 carbon atoms and 55% by weight or more $C_{21\text{-}35}$ acids with the weight ratio of odd to even carbon content acids in the $C_{21\text{-}35}$ range being between 1.5:1 and 10:1 and a metal selected from the group consisting of alkali metals, alkaline earth metals, amphoteric metals and heavy metals.

5. An ester-soap derived from an aliphatic hydroxylic compound having 2 to 25 carbon atoms and 1 to 10 primary or secondary hydroxyl groups and a mixed straight-chain aliphatic monocarboxylic acid obtained by the ozonization of a C_{22+} α-olefin wherein at least 90% by weight of the olefins contain 22 or more carbon atoms, said mixed acids containing less than 30% by weight acids having fewer than 21 carbon atoms, less than 20% by weight acids having greater than 35 carbon atoms and 55% by weight or more $C_{21\text{-}35}$ acids with the weight ratio of odd to even carbon content acids in the $C_{21\text{-}35}$ range being between 1.5:1 and 10:1, and partially saponified with a metal selected from the group consisting of alkali metals, alkaline earth metals, amphoteric metals and heavy metals, said ester-soap containing from about 0.5 to 2.5 weight percent of said metal.

4,029,683
COPPER COMPLEX
Tadatoshi Aratani; Shuzo Nakamura; Tsuneyuki Nagase, and Yukio Yoneyoshi, all of Takatsuki, Japan, assignors to Sumitomo Chemical Company, Limited, Japan
Division of Ser. No. 549,034, Feb. 11, 1975, which is a continuation-in-part of Ser. No. 442,413, Feb. 14, 1974, abandoned. This application Dec. 29, 1975, Ser. No. 645,541
Claims priority, application Japan, Feb. 14, 1973, 48-18642; June 20, 1973, 48-69997; June 20, 1973, 48-69998
Int. Cl.² C07F *1/08*

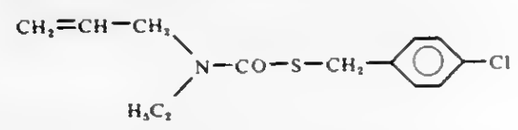
Claims priority, application Switzerland, Nov. 3, 1969, 16351/69
Int. Cl.² C07C *155/02*
U.S. Cl. 260—455 A **2 Claims**

1. The compound of the formula



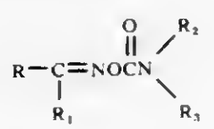
4,029,688

CARBAMIC PESTICIDAL COMPOSITIONS

Themistocles D. J. D'Silva, South Charleston, W. Va., assignor to Union Carbide Corporation, New York, N.Y.

Filed June 27, 1974, Ser. No. 483,882
Int. Cl.² C07C *121/00, 121/417*
U.S. Cl. 260—465.4 **17 Claims**

1. A compound of the formula:



wherein:
R is:
lower alkyl or
lower alkyl substituted with one or more lower alkoxy, lower alkylthio, lower alkylsulfinyl, lower alkylsulfonyl, phenylthio, phenylsulfinyl, phenylsulfonyl or $R_4CON(R_5)$—, all of which may be substituted with one or more cyano, nitro, azido, chloro, bromo or fluoro substituents
R_1 is:
hydrogen,
chlorine,
bromine,
fluorine,
cyano,
substituted or unsubstituted lower alkyl having from 1 to 4 carbon atoms,
substituted or unsubstituted lower alkylthio,
substituted or unsubstituted lower alkoxy,
substituted or unsubstituted lower carboalkoxyalkylthio, or
substituted or unsubstituted lower alkylthioalkyl;
wherein the permissible substituents may be one or more chloro, bromo, fluoro, cyano or nitro groups;
R_2 is:
lower alkyl or
lower alkyl substituted with one or more chloro, bromo, fluoro, nitro, cyano, lower alkoxy or lower alkyl groups;
R_3 is:
perhalomethanesulfenyl or
perhaloethanesulfenyl wherein the halogen substituents are chloro, bromo or fluoro; and
R_4 is:
hydrogen or
lower alkyl;
R_5 is:
hydrogen or
lower alkyl; and
with the provisos that:
a. when R is alkyl, R_1 is:
substituted lower alkyl,
substituted lower alkylthio,
substituted or unsubstituted lower alkoxy,
substituted or unsubstituted lower carboalkoxyalkylthio, or
substituted or unsubstituted lower alkylthioalkyl;
b. when R_1 is hydrogen, R is other than lower monoalkylthioalkyl; and
c. a cyano group is present in at least one of the groups R, R_1 and R_2.

1. A process for the production of even series ω-amino acids of the general empirical formula $NH_2(CH_2CH_2)_nCH_2COOH$ (I), where n is the integer 1 or 2, wherein ethylene is telomerized with methyl esters of halogen acetic acids of the general empirical formula $X_mCH_{3-m}COOCH_3$ (II), where X and M are as follows:
X = Cl, m is the integer 2 or 3; said telomerization is effected at a temperature in the range from 100 to 145° C. and under ethylene pressure in the range from 25 to 40 gage atmospheres in the presence of initiators of free-radical reactions; said telomerization producing telomers of the general empirical formula $CH_3OOCCH_{3-m}X_{m-1}(CH_2CH_2)_nX$ (III), where X, n and m are the same as in the formulas hereabove; which are reduced to telomers of the same general formula, where X = Cl and m = 1, and the latter are subjected to ammonolysis with ammonia at a temperature from 135° to 140° C to yield ammonolysis products; the ammonolysis products are further hydrolyzed with hydrochloric acid at a temperature in the range from 80° to 90° C.; the desired product is recovered from the resultant hydrolyzate by use of a styrene-divinylbenzene sulfocationite resin in the H form.

5. A process for the production of even series ω-amino acids of the general empiricol formula $NH_2(CH_2CH_2)_nCH_2COOH$ (I), where n is the integer 1 or 2, wherein ethylene is telomerized with methyl esters of halogen acetic acids of the general empirical formula $X_mCH_{3-m}COOCH_3$ (II), where X and m are as follows:
X = Br, m = 1; said telomerization is effected at a temperature in the range from 100° to 145° C. and under ethylene pressure in the range from 25 to 40 gage atmospheres in the presence of initiators of free-radical reactions; said telomerization producing telomers of the general empirical formula $CH_3OOCCH_{3-m}X_{m-1}(CH_2CH_2)_nX$ (III), where X, n and m are the same as in the formulas hereabove; which are subjected to ammonolysis with ammonia at a temperature of about 100° C to yield ammonolysis products; the ammonolysis products are further hydrolyzed with hydrochloric acid at a temperature in the range from 80° to 90° C.; the desired product is recovered from the resultant hydrolyzate by use of a styrene-divinylbenzene sulfocationite resin in the H form.

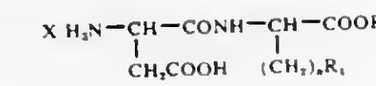
4,029,701

SWEETENING WITH HYDROHALIDE SALTS OF DIPEPTIDE SWEETENERS

Gerhard J. Haas, Woodcliff Lake, N.J., and Jeffrey H. Berg, Riverdale, N.Y., assignors to General Foods Corporation, White Plains, N.Y.

Filed Mar. 30, 1972, Ser. No. 239,789
Int. Cl.² A23L *1/236*
U.S. Cl. 426—548 **15 Claims**

1. An artifically sweetened foodstuff comprising a foodstuff and a dry dipeptide sweetener from the formula



wherein:
the stereochemical configuration is DL-DL, DL-L, L-DL, or L-D;
X represents a halide;
n represents an integer of 0 to 5;
R represents lower alkyl, lower alkylaryl and cycloalkyl;
R_1 represents
a. lower alkyl,
b. a substituted or unstubstituted unsaturated, partially saturated or totally saturated six carbon hydrocarbon ring provided that when substituted, the substituent is at the four position and is hydroxy, lower alkoxy, lower alkyl or halogen; and
c. $S(O)_m$ (lower alkyl) provided that *n* is 1 or 2 and *m* is 0, or 2,
said dry dipeptide sweetener being present in an amount effective to sweeten the foodstuff, said dipeptide salt being faster to dissolve than the corresponding unsubstituted dipeptide sweetener.

4,029,702

OIL-SOLUBLE BICARBAMAMIDE COMPOUNDS

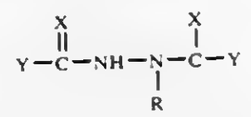
Richard J. Piccolini, Newtown, Pa., assignor to Rohm and Haas Company, Philadelphia, Pa.

Continuation-in-part of Ser. No. 720,458, April 11, 1968, Pat. No. 3,634,493. This application Oct. 12, 1971, Ser. No. 188,588

Int. Cl.² C07C *133/02*

U.S. Cl. 260—554 **2 Claims**

1. A bicarbamamide compound in the formula



wherein R represents an alkenyl radical having at least 20 carbon atoms, X is oxygen and Y is $—NR_2R_3$ wherein R_2 and R_3 are independently selected from hydrogen, alkyl, cycloalkyl, aryl, alkaryl and aralkyl.

4,029,703

N,N'-DI-SUBSTITUTED HALOPHENYLACETAMIDINES

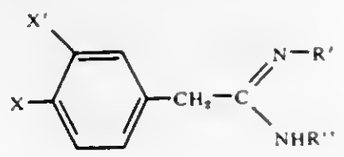
James R. McCarthy, Jr., Midland, Mich., assignor to The Dow Chemical Company, Midland, Mich.

Continuation-in-part of Ser. No. 510,955, Oct. 2, 1974, abandoned, which is a continuation-in-part of Ser. No. 456,941, April 1, 1974, abandoned, which is a continuation of Ser. No. 279,651, Aug. 10, 1972, abandoned. This application Feb. 11, 1976, Ser. No. 657,335

Int. Cl.² C07C *123/00*

U.S. Cl. 260—564 R **8 Claims**

1. A substituted amidine compound selected from the group consisting of halophenylacetamidine compounds corresponding to the formula



wherein X and X′ independently represent halo or hydrogen, with the proviso that at least one of X and X′ represents halo and R′ and R″ each independently represent loweralkyl; and the pharmaceutically-acceptable salts thereof.

4,029,704

OXIMES

Brian Anderson, Blackley, England, assignor to Imperial Chemical Industries Limited, London, England

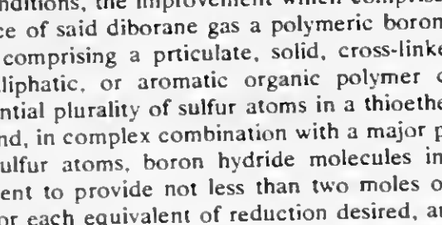
Continuation of Ser. No. 390,301, Aug. 21, 1973, abandoned. This application Aug. 12, 1975, Ser. No. 603,919

Claims priority, application United Kingdom, Aug. 25, 1972, 39703/72; Feb. 23, 1973, 8991/73; June 19, 1973, 29003/73

Int. Cl.² C07C *131/00, 131/14*

U.S. Cl. 260—566 A **2 Claims**

1. A ketoxime of the formula



wherein the oxime is in the anti configuration with respect to the phenolic hydroxyl group, X and R^2 are hydrogen and R^1 is a nonyl group.

4,029,705

PURIFICATION PROCESS FOR MDA

Adnan A. R. Sayigh, North Haven; Kwok K. Sun, Hamden, and Henri Ulrich, Northford, all of Conn., assignors to The Upjohn Company, Kalamazoo, Mich.

Filed Aug. 18, 1975, Ser. No. 605,753

Int. Cl.² C07C *85/16*

U.S. Cl. 260—570 D **8 Claims**

1. A process for selectively removing 2,2′- and 2,4′-diaminodiphenylmethanes from mixtures thereof with 4,4′-diaminodiphenylmethane said mixtures having been previously isolated from the product of condensing aniline with formaldehyde which process comprises heating an aqueous mixture consisting essentially of said diaminodiphenylmethanes, hydrochloric acid, and formaldehyde at a temperature of 30° C to 100° C, the amount of hydrochloric acid present being from 0.55 to 0.95 equivalents per equivalent of diamine present in the reaction mixture.

4,029,706

REDUCTION WITH POLYMERIC REAGENT

Guy A. Crosby, Palo Alto, Calif., assignor to Dynapol, Palo Alto, Calif.

Division of Ser. No. 456,731, April 1, 1974, Pat. No. 3,928,293. This application Mar. 10, 1975, Ser. No. 556,857

Int. Cl.² C07C *87/28*

U.S. Cl. 260—570.9 **12 Claims**

1. In the process for reducing an organic compound wherein said compound is contacted with diborance gas under reducing conditions, the improvement which comprises employing in place of said diborane gas a polymeric boron hydride reagent comprising a prticulate, solid, cross-linked aliphatic, cycloaliphatic, or aromatic organic polymer containing a substantial plurality of sulfur atoms in a thioether configuration and, in complex combination with a major proportion of said sulfur atoms, boron hydride molecules in an amount sufficient to provide not less than two moles of complexed BH_3 for each equivalent of reduction desired, and thereafter isolating the reduced organic compound and recovering said reagent.

4,029,707

PREPARATION OF N-ALKYLATED AROMATIC AMINES

Charles W. Hargis, Johnson City, Tenn., assignor to Eastman Kodak Company, Rochester, N.Y.

Filed Sept. 2, 1975, Ser. No. 609,125

Int. Cl.² C07C *87/62*

U.S. Cl. 260—577 **4 Claims**

1. A process for the production of N-alkylated aromatic amines which comprises contacting a reaction mixture of an aliphatic alcohol having 1 to about 6 carbon atoms and an aromatic amine having at least 1 hydrogen atom attached to the amino nitrogen, in the vapor phase at a temperature of from about 250° C. to about 450° C. in the presence of a catalyst consisting of eta-alumina treated with hydrofluosilicic acid.

4,029,708

LINEAR SURFACTANT POLYMERS FORMED FROM SUBSTITUTED AMINES AND DIFUNCTIONAL REACTANTS

Paul L. Seitz, and Robert K. Gabel, both of Houston, Tex., assignors to Nalco Chemical Company, Oak Brook, Ill.

Filed Feb. 10, 1975, Ser. No. 548,463

Int. Cl.² C07C *93/02*; **B01D** *17/04*; **C07C** *87/20*

U.S. Cl. 260—584 B **7 Claims**

1. A linear surfactant polymer formed by the reaction of a substituted amine with a difunctional reactant wherein said substituted amine is the reaction product of hexamethylene triamine and propylene oxide, said hexamethylene triamine being reacted with propylene oxide in a molar ratio of 5:1 to 1:5 at a temperature of from 30°–220° C. for from 1-4 hours, and said difunctional reactant is a glycol adduct of epichlorohdyrin formed by the reaction of one mole of polyethylene glycol of molecular weight 250 with two moles of epichlorohydrin said reaction being conducted at temperatures in the range of 60°–110° C. for 1–3 hours under reflux, said difunctional reactant being reacted with the substituted amine in a molar ratio of 5:1 to 1:5 at a temperature of from 100°–250° C. for a period of time ranging from 1–6 hours.

4,029,709

PROCESS FOR THE HYDROGENATION OF CITRAL TO CITRONELLAL AND OF CITRONELLAL TO CITRONELLOL USING CHROMIUM-PROMOTED RANEY NICKEL CATALYST

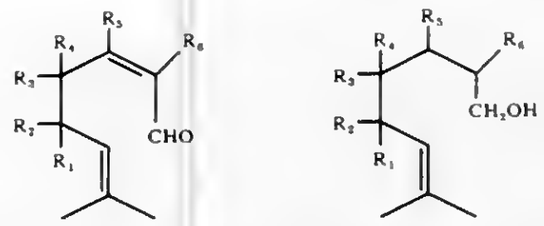
Robert S. De Simone, Middletown, N.Y., and Peter S. Gradeff, Andover, N.J., assignors to Rhodia, Inc., New York, N.Y.

Filed Feb. 17, 1976, Ser. No. 658,788

Int. Cl.² C07C *47/20*

U.S. Cl. 260—601 R **15 Claims**

1. In the process for the hydogenation of unsaturated aldehydes having the formulae:
to form an aldehyde and/or alcohol having the formulae:



wherein R_1, R_2, R_3, R_4, and R_6 are selected from the group consisting of hydrogen and lower alkyl groups having from one to about five carbon atoms and R_5 is a lower alkyl group having from one to about five carbon atoms, which comprises hydrogenating the aldehyde in the presence of catalyst and hydrogen gas, the improvement which comprises carrying out the hydrogenation in the presence of a chromium-promoted Raney nickel catalyst at a temperature within the range from about 5° C to about 200° C, and at a hydrogen pressure within the range from atmospheric pressure to about 500 psi.

4,029,710

4-ALKOXY-n-BUTYRALDEHYDE PREPARATION

Shigeto Suzuki, San Francisco, Calif., assignor to Chevron Research Company, San Francisco, Calif.

Filed Mar. 31, 1976, Ser. No. 672,363

Int. Cl.² C07C *47/02*

U.S. Cl. 260—602 **11 Claims**

1. A process for preparing 4-alkoxy-n-butyraldehyde which comprises contacting allyl alcohol, formaldehyde and a C_1 to C_{20} primary alcohol in the presence of hydrogen fluoride at a temperature of from about −100° to about 10° C and a pressure of from about 10 to about 1000 psia.

4,029,711

4-HYDROXY-n-BUTYRALDEHYDE FROM ALLYL ALCOHOL AND FORMALDEHYDE

Shigeto Suzuki, San Francisco, Calif., assignor to Chevron Research Company, San Francisco, Calif.

Filed Mar. 31, 1976, Ser. No. 672,362

Int. Cl.² C07C *47/02*

U.S. Cl. 260—602 **7 Claims**

1. A process for preparing 4-hydroxy-n-butyraldehyde which comprises contacting allyl alcohol and formaldehyde in the presence of hydrogen fluoride at a temperature from about −100° C to about 10° C and a pressure of from about 10 psia to about 1000 psia.

4,029,712

SULFOXIDE DERIVATIVE AND PROCESS FOR ITS PREPARATION

Genichi Tsuchihashi, Tama, and Katsuyuki Ogura, Kyoto, both of Japan, assignors to Sagami Chemical Research Center, Tokyo, Japan

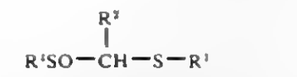
Division of Ser. No. 211,100, Dec. 22, 1971, Pat. No. 3,742,066. This application Mar. 30, 1973, Ser. No. 347,408

Claims priority, application Japan, Apr. 20, 1971, 46-24908; May 11, 1971, 46-30810

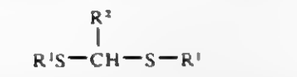
Int. Cl.² C07C *149/14*

U.S. Cl. 260—609 R **2 Claims**

1. A process for preparing a sulfoxide derivative of the formula



wherein R^1 is lower alkyl or phenyl and R^2 is hydrogen, lower alkyl, benzyl, p-methoxybenzyl or p-bromobenzyl, which comprises oxidizing a mercaptal of the formula



wherein R^1 and R^2 are as defined above, with 1.0–3.0 oxidative-equivalents of an oxidant selected from the group consisting of hydrogen peroxide, m-chloroperbenzoic acid and sodium metaperiodate at a temperature of from −20° to 50° C.

4,029,713

SUBSTITUTED HYDROXY-PHENYL PROPANOLS

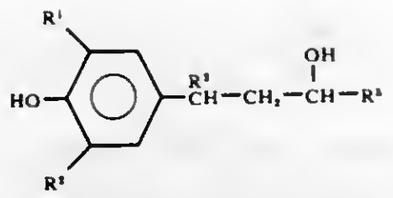
Dane K. Parker, Canton, Ohio, assignor to The Goodyear Tire & Rubber Company, Akron, Ohio

Division of Ser. No. 435,569, Jan. 22, 1974, Pat. No. 3,989,741. This application Dec. 11, 1975, Ser. No. 639,662

Int. Cl.² C07C *39/06, 39/12*

U.S. Cl. 260—624 R **2 Claims**

1. A compound having the general formula



wherein R^1 and R^2 are the same or different radicals selected from the group consisting of tertiary alkyl radicals having from 4 to 12 carbon atoms, R^3 is selected from the group consisting of hydrogen and n-alkyl radicals having from 1 to 20 carbon atoms and R^4 is selected from the group consisting of alkyl radicals having from 1 to 10 carbon atoms, alkenyl radicals having from 2 to 10 carbon atoms, and aryl radicals having from 6 to 12 carbon atoms.

4,029,714

ETHYLENE/CHLORINE ELIMINATION PROCESS

Allyn J. Ziegenhagen, and Ramsey G. Campbell, both of Berkeley, Calif., assignors to Stauffer Chemical Company, Westport, Conn.

Filed Nov. 5, 1975, Ser. No. 629,171
Int. Cl.² C07C *17/00*
U.S. Cl. 260—658 R 9 Claims

1. The process for eliminating chlorine and ethylene from a waste stream comprising chlorine at a concentration of up to about 5000 ppm (vol), and unchlorinated and partially chlorinated hydrocarbons, which comprises reacting said waste stream at a temperature between about 90° C and about 250° C and at a pressure between about 15 psig and about 75 psig, at a space velocity between about 50 hour^{-1} and about 2000 hour^{-1} and a residence time between about 2 sec and about 50 sec, over a fixed catalyst bed comprising a mixture of metallic iron and particles of activated alumina impregnated with ferric chloride either by prior treatment or by in situ deposition arising from the action of molecular chlorine on the metallic iron, in which the ratio of the superficial surface area of the iron to the total BET surface area of the alumina ranges from a value equal to 1.5 times the surface area of the inner reactor wall divided by the total BET surface area of the alumina contained therein, of about 1×10^{-7}, whichever is greater, to about 2×10^{-6}, to produce an effluent comprising more highly chlorinated hydrocarbons, and less than 200 ppm by volume of chlorine.

4,029,715

PREPARATION OF ETHYL BENZENE

Robert W. Rieve, Springfield, and Harold Shalit, Drexel Hill, both of Pa., assignors to Atlantic Richfield Company, Los Angeles, Calif.

Filed Aug. 24, 1976, Ser. No. 717,318
Int. Cl.² C07C *15/04*
U.S. Cl. 260—668 D 1 Claim

1. The method of preparing ethyl benzene which consists of:
directing a stream of C_8 cyclic olefin hydrocarbon vapors rich in 4-vinyl cyclohexene-1, together with a larger volume of an inert gas selected from nitrogen, steam, carbon dioxide, argon, and mixtures thereof as a reactant stream toward a fixed bed of catalyst particles, said reactant stream being substantially free from hydrogen;
directing said reactant stream through a fixed bed of particles consisting of alumina-supported oxides of cobalt, molydenum and potassium, the concentration of potassium oxide being within a range from about 0.9% to about 3%, said bed of particles being maintained at pressure within a range from about 0.4 to 8 atmospheres and at a temperature within a range from about b 400° C to about 450° C, the liquid space rate of C_8 hydrocarbons with respect to said bed of particles being within a range from about 0.5 to about 3.0 volumes of liquid per volume of catalyst bed per hour;
and recovering ethyl benzene from the effluent from said catalyst bed.

4,029,716

SELECTIVE PRODUCTION OF PARA-XYLENE

Warren W. Kaeding, Westfield, N.J., assignor to Mobil Oil Corporation, New York, N.Y.

Filed Dec. 8, 1975, Ser. No. 638,864
Int. Cl.² C07C *3/62*, *15/08*
U.S. Cl. 260—672 T 10 Claims

1. A process for the selective production of paraxylene which comprises contacting toluene at a temperature between about 400° and about 700° C., a pressure between about 1 atmosphere and about 1000 psig and a weight hourly space velocity of between about 1 and about 20 with a catalyst consisting essentially of a crystalline aluminosilicate zeolite having a silica to alumina ratio of at least about 12 and a constraint index within the approximate range of 1 to 12, said zeolite having combined therewith boron in an amount of at least about 0.2 percent by weight as a result of reaction of said zeolite with a boron-containing compound; cooling the resulting product and separating para-xylene therefrom.

4,029,717

SIMULATED MOVING BED ADSORPTION-DESORPTION PROCESS FOR PARAXYLENE RECOVERY

Frank J. Healy, Morristown, and Paul R. Geissler, Edison, both of N.J., assignors to Exxon Research and Engineering Company, Linden, N.J.

Continuation-in-part of Ser. No. 457,056, April 1, 1974, abandoned. This application Mar. 7, 1975, Ser. No. 556,431
Int. Cl.² C07C *7/13*; C10G *25/04*; B01D *15/08*
U.S. Cl. 260—674 SA 10 Claims

1. In a process for continuously separating, in a liquid phase, the components of a liquid C_8 aromatic feedstream wherein at least one of said components is selectively adsorbed by contact with a solid sorbent material utilizing a simulated countercurrent flow system wherein liquid streams are allowed to flow downward through a desorption zone, a rectification zone and a sorption zone, each zone being serially and circularly interconnected and divided into a plurality of serially interconnected sections, each section being packed with a mass of said solid sorbent material, the improvement whih comprises:
I. introducing a desorbent stream containing meta-diisopropylbenzene into the first section of said desorption zone:
II. withdrawing a desorption effluent comprising at least one selectively sorbed component from the last section of said desorption zone;
III. introducing said C_8 aromatic feedstream into the first section of said sorption zone; and
IV. withdrawing a raffinate effluent comprising a less sorbed component from the last section of said sorption zone.

4,029,718

PIVALOLACTONE RANDOM GRAFT COPOLYMERS

Sherman A. Sundet, Wilmington, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Division of Ser. No. 268,056, June 30, 1972, Pat. No. 3,897,513, which is a continuation-in-part of Ser. No. 166,281, July 26, 1971, abandoned. This application May 20, 1975, Ser. No. 579,362
Int. Cl.² C08L *51/04*
U.S. Cl. 260—877 17 Claims

1. A thermoplastic random organic graft copolymer formed by contacting
an amorphous base polymer having at least one random carbanion site thereon
with up to 150% by weight of the polymer, of at least one α-substituted-β-propiolactone in an amount such that the ratio of the moles of β-lactone to the moles of anionic sites on the base polymer varies between 3 to 1000, and
polymerizing said β-lactone to form crystallizable polymer sidechains, said sidechains having a length of between 3 to 1000 monomer units and a weight of up to 60% of the graft composition,
said base polymer being characterized in that it is amorphous to X-rays at a temperature of 130° C or below, and has a molecular weight of above 2,000.

4,029,719

PROCESS FOR THE DIMERIZATION OR CO-DIMERIZATION OF LINEAR OLEFINS AND CATALYSTS THEREFORE

Lucio Forni, and Renzo Invernizzi, both of Milan, Italy, assignors to Societa Italiana Resine S.I.R. S.p.A., Milan, Italy

Division of Ser. No. 398,507, Sept. 18, 1973, abandoned. This application Dec. 8, 1975, Ser. No. 638,387
Claims priority, application Italy, Sept. 20, 1972, 29427/72
Int. Cl.² C07C *3/20*
U.S. Cl. 260—683.15 R 12 Claims

1. Process for the preparation of linear olefins having from 6 to 24 carbon atoms in the molecule, characterized by the introduction of one or more linear olefins having from 3 to 12 carbon atoms in the molecule to the catalysts obtained by activating, by means of an organic or inorganic base, a natural or synthetic crystalline zeolite on which has previously been deposited by ion exchange at least one metal chosen from among those belonging to group VIII of the periodic system of elements in an amount of from 0.1% to 50% by weight with respect to the zeolite, bringing the resulting product into contact with an organic or inorganic base in the liquid or gaseous form at a temperature in the range from −35 to 250° C for a time of at least 30 min, eliminating the excess of the base and heat-treating at temperatures in the range from 50 to 450° C for at least 30 min., and by operating at temperatures of from 130° to 260° C and at pressures of from 2 to 70 atmospheres.

4,029,720

BLOCK OR GRAFT COPOLYMERS OF POLYALKYLENE OXIDES AND VINYLAROMATIC OR DIENE POLYMERS

Erhard Seller, Ludwigshafen; Gerhard Fahrbach, Schwetzingen, and Dieter Stein, Limburgerhof, all of Germany, assignors to Badische Anilin- & Soda-Fabrik Aktiengeselischaft, Ludwigshafen (Rhine), Germany

Continuation of Ser. No. 385,982, Aug. 6, 1973, abandoned. This application Mar. 3, 1975, Ser. No. 555,026
Claims priority, application Germany, Aug. 10, 1972, 2239401
Int. Cl.² C08L *9/00*, *9/06*
U.S. Cl. 260—887 11 Claims

1. A process for the manufacture of block copolymers of polyalkylene oxides which comprises:
1. forming a polymer block A by homopolymerizing an alkylene oxide selected from the group consisting of ethylene oxide and propylene oxide or block copolymerizing at least one of said alkylene oxides with at least one monomer selected from the group consisting of styrene, butadiene and isoprene to form alternating polymeric blocks within said block A using organosodium or organopotassium compounds as initiators in polar organic solvents;
2. forming a polymer block B by the steps of
a. polymerizing at least one monomer selected from the group consisting of butadiene, isoprene and styrene in a non-polar hydrocarbon solvent using an organolithium compound as initiator, wherein less than 60% of the diene units in said polymer block B have a 1,2-vinyl structure, and
b. adding methyl methacrylate to the living chain ends of the polymer block B in amounts of from 0.5 to 10% by weight of methyl methacrylate based on the weight of block B, whereby short polymethyl methacrylate claims are formed having ester end groups bearing a living CH_2 group; and
3. forming the final block copolymer by adding polymer block A to polymer block B with the reaction of at least one living alkali metal alcoholate end group of block A with at least one ester group of block B with the elimination of alkali metal methoxide.

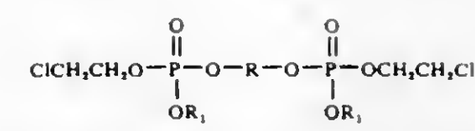
4,029,721

HALOGEN-CONTAINING PHOSPHORIC ACID POLYESTERS

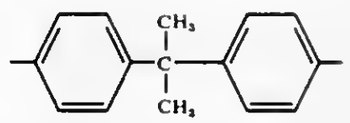
Hartfrid Vollmer; Franz-Josef Dany, both of Erfstadt; Joachim Wortmann, Turnich, and Peter Munch, Erfstadt, all of Germany, assignors to Hoechst Aktiengeselischaft, Frankfurt am Main, Germany

Filed Oct. 21, 1975, Ser. No. 624,546
Claims priority, application Germany, Oct. 26, 1974, 2451077
Int. Cl.² C07F *9/08*, *9/12*
U.S. Cl. 260—928 14 Claims

1. Halogen-containing phosphoric acid polyesters of the general formula



in which R stands for an alkylene radical or a halogen-substituted alkylene radical having from 2 to 6 carbon atoms, a —CH_2CH_2O—CH_2CH_2— radical, a phenylene radical or a radical of the formula



and R_1 stands for a branched or unbranched alkyl radical having from 6 to 18 carbon atoms.

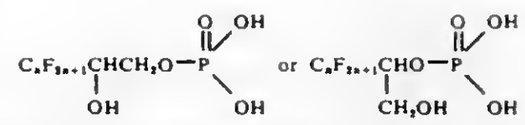
4,029,722

POLYFLUOROALKYL GLYCOL MONOESTERS OF ORTHOPHOSPHORIC ACID, AND THEIR SALTS AND METHOD OF PREPARATION

Michel Démarcq, and Joseph Slezions, both of Lyon, France, assignors to Produits Chimiques Ugine Kuhlmann, Paris, France

Filed Apr. 19, 1974, Ser. No. 462,549
Claims priority, application France, Apr. 19, 1973, 73.14313
Int. Cl.² C07F *9/09*
U.S. Cl. 260—953 10 Claims

1. Compounds of the formula



wherein *n* is 2 to 18 and salts thereof.

4,029,723

EVAPORATIVE AIRCONDITIONER

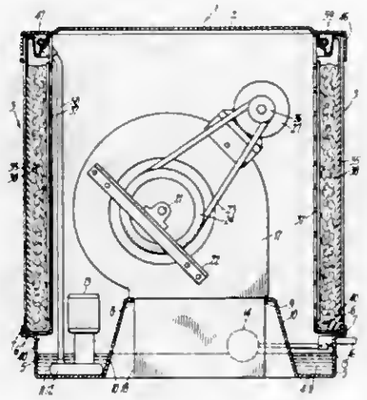
Terrence Keith Morrison, and Brian Eric McLaren, both of P.O. Box 156, Buronga, New South Wales 2648, Australia

Continuation of Ser. No. 618,242, Sept. 30, 1975, abandoned. This application Oct. 18, 1976, Ser. No. 733,404

Claims priority, application Australia, Sept. 30, 1974, 9073/74

Int. Cl.² F24F 3/14

U.S. Cl. 261—29 7 Claims



1. An evaporative airconditioner comprising:

a base panel,

a top panel,

side panels which include stiles having mitred side edges and wherein stiles of adjacent side panels abut and close sides of the airconditioner;

wherein the base panel includes a bottom, a first platform above the bottom, a second, perimetric, platform supporting the lower ends of the side panels and inner and outer walls respectively supporting the first and second platforms and with the bottom defining an annular water sump;

wherein the second platform has a perimetric flange restricting the lower ends of the side panels against outward movement;

air blower means supported on the first platform;

an outlet from the air blower means;

an aperture in one of the base, top and side panels in register with said outlet;

a water trough;

wherein the upper ends of the side panels and the water trough are complimentarily formed whereby the trough stabilizes the upper ends of the side panels and whereby the side panels support and locate the trough;

a water absorbent material carried by at least one of the side panels; and

pump means operative in use to pump water from the sump to the trough for distribution to said material for evaporation therefrom.

4,029,724

METHOD OF AND APPARATUS FOR MIXING GAS INTO LIQUIDS FOR CULTIVATING MICROORGANISMS

Hans Muller, Erlenbach, Zurich, and Bruno Guazzone, Rapperswil, both of Switzerland, assignors to Hans Muller, Mannedorf, Switzerland

Continuation of Ser. No. 529,132, Dec. 3, 1974, abandoned. This application June 25, 1976, Ser. No. 699,709

Claims priority, application Switzerland, Dec. 4, 1973, 16819/73

Int. Cl.² B01F 3/04

U.S. Cl. 261—87 10 Claims

1. In an apparatus for mixing gas into liquids, particularly for aerating microorganisms in liquids, a combination comprising a vessel for a liquid; a hollow rotary impeller mounted for rotation in said vessel and having a venturi-shaped passage of hourglass configuration, comprised of an inlet in communication with the interior of said vessel and being located in the region of the axis of rotation of said impeller, an outlet located at the outer periphery of said impeller, and a throat located intermediate said inlet and said outlet and operative for drawing a stream of liquid through said passage in a first flow path; first gas outlet means including a plurality of first gas outlets located in said throat and communicating said throat with a source of gas so as to entrain the latter by the force of venturi suction prior to discharge of the resulting mixture through said outlet; means defining a separate second flow path for communicating a source of gas with said mixture at said outer periphery of said impeller; and second gas outlet means including a plurality of second gas outlets communicating with said separate means defining a second flow path, being located radially outwardly adjacent said outer periphery, and facing oppositely to the direction of rotation of said impeller for generating a suction force outwardly adjacent said outer periphery so as to draw the mixture in said first flow path outwardly from said hollow impeller into contact with the gas flowing in said second flow path, whereby a final mixture of finely-dispersed gas and liquid is obtained.

NONOXIDATIVE PROCESS FOR PURIFYING AQUEOUS INORGANIC SALT SOLUTIONS EMPLOYED IN THE WET SPINNING OF FILAMENTARY VINYL POLYMERS

Rupert B. Hurley, Wiliamsburg; Frederick B. Eastwood, Gloucester, and Joe A. Mann, Williamsburg, all of Va., assignors to Dow Badische Company, Williamburg, Va.

Filed Apr. 2, 1976, Ser. No. 672,892

Int. Cl.² D01F 13/00

U.S. Cl. 264—38 5 Claims

1. In the continuous process for producing a filamentary vinyl polymer including the procedural steps of

a. polymerizing a vinyl monomer in a concentrated aqueous inorganic salt solution to produce a vinyl polymer solution;

b. spinning the resulting vinyl polymer solution through a spinnerette into a coagulating bath containing an aqueous solution of the same inorganic salt as that employed in the polymerization step, the concentration of inorganic salt in the coagulating bath being maintained at a level which affords precipitation of the vinyl polymer to form a coherent filamentary gel;

c. washing the vinyl polymer filamentary gel so produced;

d. recovering the concentrated aqueous inorganic salt solution from the washing and coagulation steps by concentrating the combined effluents thereof; and

e. recycling the recovered concentrated aqueous inorganic salt solution into the polymerizing step;

in which process metallic ion and organic molecular impurities accumulate in the recovered concentrated aqueous inorganic salt solution; the improvement in such process which comprises purifying the recovered aqueous inorganic salt solution prior to the recycling and re-use thereof by complexing the metallic ion impurities and adsorbing the resulting metal complexes along with organic molecular impurities on activated carbon.

4,029,726

CELLULOSIC-LIQUID COMPOSITE MATERIALS AND PROCESS OF PREPARING SUCH MATERIALS

Larry D. Nichols, Arlington, Mass., assignor to Moleculon Research Corporation, Cambridge, Mass.

Continuation-in-part of Ser. No. 363,267, May 23, 1973, Pat. No. 3,846,404. This application Oct. 29, 1974, Ser. No. 518,797

The portion of the term of this patent subsequent to Nov. 5, 1997, has been disclaimed.

Int. Cl.² B29D 27/04; B29H 7/20; C08L 1/12

U.S. Cl. 264—41 15 Claims

1. A process of preparing a polymer-liquid composite material, which process comprises:

a. providing a solvent solution of a cellulosic polymer having electronegative substituents, wherein the cellulosic polymer is selected from the group consisting of cellulose nitrate with a degree of substitution greater than about 2.25, cellulose acetate with a degree of substitution greater than about 2.90, a mixed cellulose nitrate and acetate cellulosic ester with a degree of substitution between about 2.25 and 2.90, and cellulose propionate with a degree of substitution greater than about 2.90, the solvent comprising a hydrogen-bonding solvent;

b. casting a wet film of the solvent solution;

c. forming an insoluble film by precipitating the cellulosic polymer in the wet film by contacting the film with a nonsolvent for the polymer, which nonsolvent is miscible with the solvent for the polymer so as to replace the solvent with the nonsolvent at a temperature below about 45° C to provide an essentially transparent, self-supporting, irreversibly shrinkable, ultramicroporous cellulosic polymer film having distinct interpenetrating cellulosic polymer and liquid nonsolvent phases.

4,029,727

CHITIN FILMS AND FIBERS

Paul Roland Austin, Wilmington, and Charles James Brine, Newark, both of Del., assignors to The University of Delaware, Newark, Del.

Filed Apr. 16, 1975, Ser. No. 568,434

Int. Cl.² C08B 37/08

U.S. Cl. 264—186 19 Claims

1. A cold drawn fiber, film or shaped object of renatured chitin containing crystalline chitin.

4. The fiber, film or shaped object of renatured chitin characterized by there being present in the renatured chitin characterized by there being present in the renatured chitin renatured fibrils, crystallites or spherulites, showing (1) a Maltese Cross or birefringence with a polarizing microscope, (2) an *x*-ray pattern with sharp concentric Debye rings, and (3) a specific gravity above 1.40, and in an amount sufficient for said fiber, film or shaped object to be cold drawn at least 25 percent of one of its original dimensions.

4,029,728

METHOD OF INJECTION MOULDING PALLETS

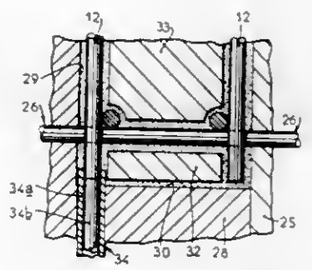
Herbert John Sharp, Greenford; Rudolf Drucker, London; Edward Droar, and Syed Mujahid Ali Zaidi, both of Harrow, all of England, assignors to GKN Sankey Limited, Bilston

Continuation-in-part of Ser. No. 472,017, May 12, 1974, abandoned. This application Jan. 6, 1976, Ser. No. 646,822

Int. Cl.² B29D 3/02

U.S. Cl. 264—278 5 Claims

1. A method of injection moulding a pallet having a reinforcing frame which includes at least two assemblies having vertical and horizontal rods connected at their crossing points and said assemblies being connected together in spaced generally parallel relationship by a plurality of cross members, the method of injection moulding comprising the steps of; placing said frame within the walls of an open mould cavity, extending a plurality of first projections into said open cavity to engage at least two of said rods to hold said frame within said cavity and in spaced relationship with said cavity walls, closing said mould cavity, extending a pluralirty of opposed second projections horizontally into said closed cavity into engagement with said frame to hold said frame in said location, injecting ther-



moplastic polymeric material under pressure into said closed cavity to fill the cavity and thus substantially to encapsulate said frame with said material, withdrawing said first and second projections so that said plastics material flows into the voids created by the withdrawal of said projections thus completing the encapsulation of said frame by said material, causing said material to solidify, opening said mould cavity and removing said pallet.

4,029,729

ROTATIONAL MOLDING AND COMPOSITIONS THEREFOR

Robert L. Rees, and Fay W. Bailey, both of Bartlesville, Okla., assignors to Phillips Petroleum Company, Bartlesville, Okla.

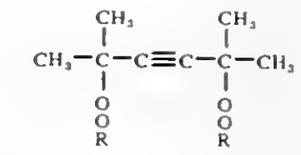
Division of Ser. No. 69,190, Sept. 2, 1970, abandoned, which is a continuation-in-part of Ser. No. 808,000, March 17, 1969, abandoned. This application May 8, 1972, Ser. No. 251,474

Int. Cl.² B29C 5/04

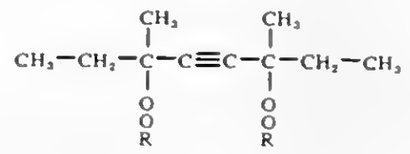
U.S. Cl. 264—310 14 Claims

1. A method for producing hollow articles which comprises:

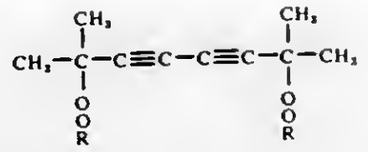
supplying to a mold a measured amount of a powdered thermoplastic moldable material comprising a solid polymer selected from the group consisting of ethylene homopolymers, copolymers of ethylene and at least one acrylic mono-1 olefin hydrocarbon having 3 to 8 carbon atoms per molecule formed from at least 75 weight percent ethylene, and mixtures thereof, having a melt index of at least about 10 having incorporated within the molding resin a crosslinking amount of an acetylenic diperoxy compound selected from the group consisting of hexynes having the formula



octynes having the formula



and octynes having the formula



wherein R is selected from the group consisting of tertiary alkyl, alkyl carbonate, and benzoate;

rotating the mold while heating it to fuse the thermoplastic powder; and

cooling the mold to cause the hollow article to solidify whereby said article has high impact strength and environmental stress cracking resistance (ESCR) and smooth inner surface.

4,029,730

CORDLESS VEHICLE TIRE

Herman E. Schroeder, Hockessin, Del., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 476,132, May 31, 1974, abandoned, which is a division of Ser. No. 217,033, Jan. 11, 1972, Pat. No. 3,860,052. This application June 25, 1975, Ser. No. 590,375

Int. Cl.² B29H *5/18*

U.S. Cl. 264—315 **5 Claims**

1. A process for rapidly making a cordless vehicle tire which comprises adding to a mold containing an ethylene/-propylene/non-conjugated diene elastomer tread an isocyana-to-terminated prepolymer made from the reaction of an organic diisocyanate and a poly(alkylene oxide) glycol containing dispersed therein a methylene dianiline salt complex wherein said salt is selected from the group consisting of sodium chloride, sodium bromide, sodium iodide, sodium nitrite, lithium chloride, lithium bromide, lithium iodide, lithium nitrite or sodium cyanide, heating the prepolymer to a temperature of at least about 100° C in contact with the tread to simultaneously effect curing and adherence of the resulting polyurethane-carcass-sidewall to the tread.

4,029,731

AMINOPHENYLTETRALIN COMPOUNDS

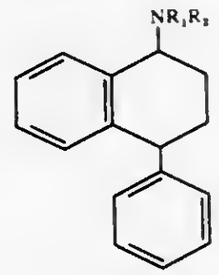
Reinhard Sarges, Mystic, Conn., assignor to Pfizer Inc., New York, N.Y.

Division of Ser. No. 521,451, Nov. 6, 1974, abandoned, which is a continuation of Ser. No. 292,526, Sept. 27, 1972, abandoned. This application June 4, 1976, Ser. No. 692,764

Int. Cl.² A01N *9/20, 9/24*; **C07C** *87/64*

U.S. Cl. 424—316 **5 Claims**

1. A method for combating depression in the treatment of a mentally-depressed subject, which comprises administering to said subject an effective amount of a compound selected from the group consisting of the trans-isomers of 1-amino-4-phenyltetraline bases of the formula;



and the pharmaceutically acceptable acid addition salts thereof, wherein R_1 is a member selected from the group consisting of hydrogen and alkyl having from one to three carbon atoms, and R_2 is a member selected from the group consisting of hydrogen alkyl having from one to three carbon atoms and cycloalkyl having from three to six carbon atoms, said R_2 only being cycloalkyl when R_1 is hydrogen.

4,029,732

PREPARATION OF BROMINE

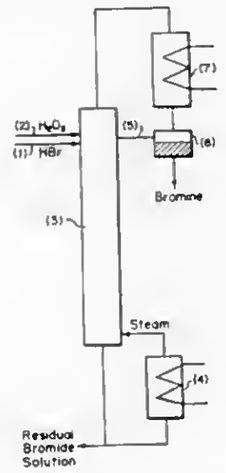
Georges Calloue, Port De Bouc, and Arsène Isard, Grenoble, both of France, assignors to Produits Chimiques Ugine Kuhlmann, Paris, France

Filed July 29, 1975, Ser. No. 599,960

Claims priority, application France, Aug. 2, 1974, 74.26851

Int. Cl.² C01B *7/10*

U.S. Cl. 423—500 **8 Claims**



1. A method of preparing bromine in an aqueous medium which comprises

a. contacting an aqueous solution of hydrogen peroxide with an aqueous solution containing bromide ions in an amount of about 0.1 to 1.0 mols of hydrogen peroxide per mol of bromide ion, to produce bromine;

b. vaporizing and removing the bromine produced from the aqueous medium substantially as rapidly as it is produced by an upward stream of inert gas or steam to substantially prevent the bromine from reacting with the hydrogen peroxide; and

c. condensing and collecting the bromine.

4,029,733

EXTRACTION OF METALS FROM SEA NODULES

Pierre Faugeras, Versailles; Pierre Miquel, Chatillon, and Michèle Robaglia, Orsay, all of France, assignors to Commissariat a l'Energie Atomique, Paris, France

Filed Feb. 11, 1975, Ser. No. 549,046

Claims priority, application France, Feb. 28, 1974, 74.06888

Int. Cl.² C01G *3/10, 53/10*

U.S. Cl. 423—21 **8 Claims**

1. A method for extraction of metals from manganiferous sea nodules, wherein said method comprises the steps of:

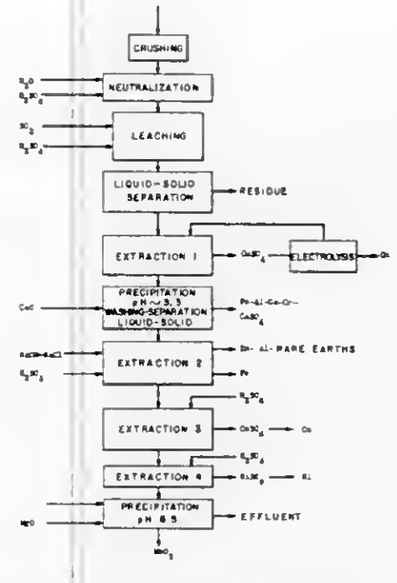
a. crushing of the ore;

b. mixing the crushed ore with a first sulphuric acid solution to form a pulp;

c. neutralizing the pulp by contact with a second sulphuric acid solution to adjust the pH of the pulp to 2 to 4, leaving substantially all the metals dissolved in the ore;

d. introducing a controlled quantity of sulphur dioxide gas corresponding to the stoichiometry of the reaction of sulphation of manganese dioxide by sulphur dioxide at a pH value within the range of 1.5 to 4 with agitation in order to break down the structure of the neutralized ore and promote subsequent dissolution of the metals including the desired quantity of manganese;

e. leaching the ore with sulphuric acid at a pH value within the range of 1 to 3;



f. separating the solid and liquid phases; and

g. separating the metals contained in the liquid phase.

4,029,734

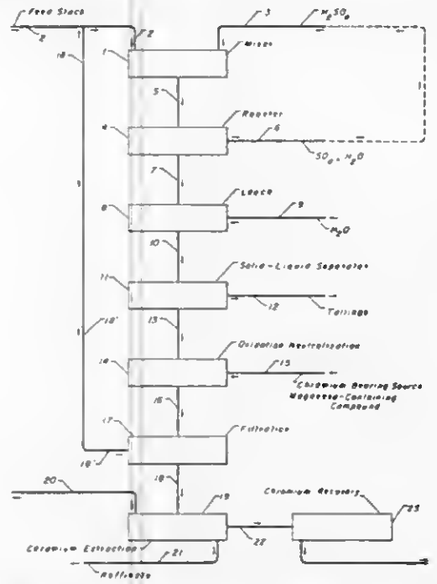
RECOVERY OF CHROMIUM VALUES

John C. Stauter, Itasca, and Richard T. Um, Mount Prospect, both of Ill., assignors to UOP Inc., Des Plaines, Ill.

Filed Feb. 19, 1976, Ser. No. 659,390

Int. Cl.² C01G *37/00*

U.S. Cl. 423—54 **8 Claims**



1. In the recovery of chromium values from a chromium bearing source, the improved method which comprises the steps of:

a. forming a mixture of said chromium bearing source, sulfuric acid and a compound containing manganese in at least a +4 valence state in a weight ratio of from about 1:1:1 to about 1:2:10 chromium bearing source, manganese compound and sulfuric acid, respectively;

b. roasting said mixture at a temperature of from about 200° to about 500° C for a sufficient time to remove the major portion of its water content and excess sulfuric acid;

c. leaching the resultant damp pulp with water at a temperature of from about 25° to about 95° C;

d. filtering the leach solution to separate undissolved solids from pregnant leach liquor containing dissolved manganese compound and chromium ions in a +3 valence state;

e. subjecting the pregnant leach liquor to a neutralization-oxidation treatment with an additional amount of said chromium bearing source and manganese compound to oxidize said chromium ions to a +6 valence state; and

f. thereafter selectively extracting chromium from the thus treated pregnant leach liquor.

4,029,735

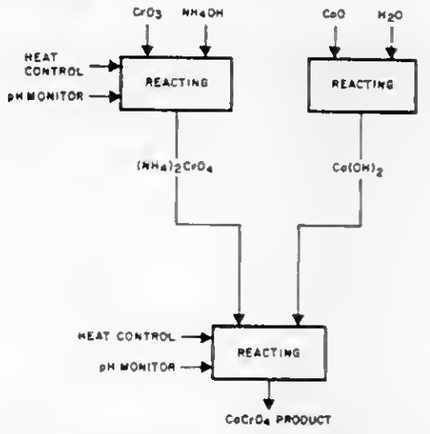
PROCESS FOR MAKING CALCIUM CHROMATE

Beverly M. Dillard, Clearwater, and William W. Welbon, Bellealr, both of Fla., assignors to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed Oct. 9, 1975, Ser. No. 621,000

Int. Cl.² C01G *37/14*

U.S. Cl. 423—596 **1 Claim**



1. A process for forming calcium chromate comprising: reacting aqueous chromium trioxide with ammonium hydroxide to form aqueous ammonium chromate by adding the ammonium hydroxide to the aqueous chromium trioxide at a rate establishing and thereafter maintaining a temperature of about 65° to 75° C until a pH of about 7 is attained; and reacting calcium oxide with water to form an aqueous suspension of calcium hydroxide and reacting the aqueous ammonium chromate and the calcium hydroxide to form the calcium chromate by adding the aqueous calcium hydroxide suspension to the aqueous ammonium chromate at a rate establishing and thereafter maintaining a temperature of about 65° to 70° C until a pH of about 10 to 11 is attained.

4,029,736

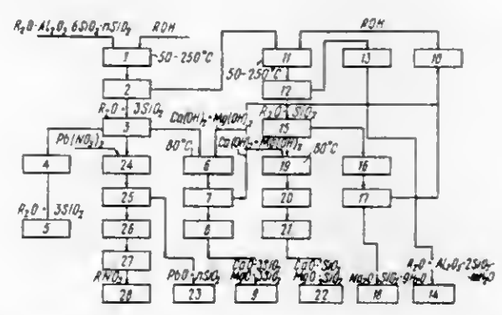
PROCESSING PEARLITE TO OBTAIN METAL SILICATES

Garegin Sarkisovich Melkonian, ulitsa Barekamutiana, 26, kv. 11, Erevan, U.S.S.R.

Filed June 7, 1973, Ser. No. 367,876

Int. Cl.² C01B *33/26*

U.S. Cl. 423—118 **8 Claims**



1. A method of processing pearlite comprising treating pearlite with an alkali metal hydroxide solution having a concentration of 40–140 g/l taken in an amount which brings the ratio of the liquid and solid phases to (0.7–1.5) : 1, to form a

pulp, hydrothermally treating the obtained pulp in an autoclave to form water glass and separating the water glass from the residue by filtration, treating the residue with an alkali metal hydroxide solution having a concentration of 150–200 g/l taken in an amount which brings the ratio of the liquid and solid phases to 0.5:1, at a temperature not below 50° C, followed by filtering to separate a residue of sodium metasilicate.

2. The method of claim 1, wherein the residue, separated upon filtering sodium metasilicate, containing alkali metal aluminosilicates is subjected to drying.

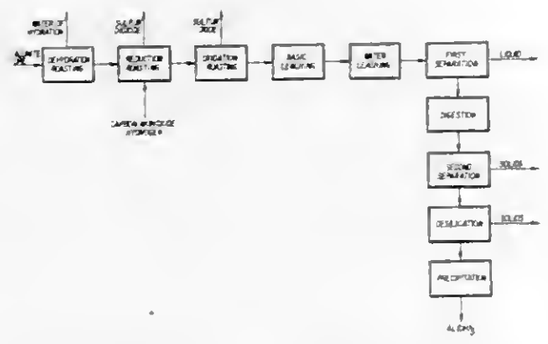
3. The method of claim 1, wherein the filtrate, obtained on separating the sodium metasilicate by filtration is reacted with hydroxides of alkaline earth metals taken in equivalent ratios to form a pulp, and the pulp is heated to the boiling temperature, whereupon the precipitated silicates of alkaline earth metals are separated by filtration.

4,029,737

REDOX TREATMENT OF ALUNITE ORE

Douglas Stevens, Golden, Colo.; Helge O. Forberg, Owensboro, Ky.; Larry D. Jennings, Arvada, Colo.; David L. Thompson, Arvada, Colo., and Julian V. Copenhaver, Arvada, Colo., assignors to Southwire Company, Carrollton, Ga.; National Steel Corporation, Pittsburgh, Pa. and Earth Sciences, Inc., Golden, Colo.

Filed Apr. 9, 1976, Ser. No. 675,383
Int. Cl.² C01F 7/06, 7/14
U.S. Cl. 423—127 24 Claims



1. A method for recovering aluminum hydroxide and other valuable constituents from ore containing alunite, comprising the steps of:

a. roasting the ore to remove water of hydration,

b. roasting the dehydrated ore resulting from step (a) in a reducing atmosphere to remove sulfate,

c. roasting the reduced ore resulting from step (b) in an oxidizing atmosphere to convert sulfides to sulfur oxides,

d. leaching the oxidized ore from step (c) with an aqueous containing inorganic base at a pH of from about 8 to about 10.5 to avoid the subsequent formation of trihydrates,

e. leaching the oxidized ore resulting from step (d) with an aqueous containing inorganic solvent to remove potassium and sulfate,

f. separating the liquid and solid portions of the slurry resulting from step (e),

g. digesting the solid portion resulting from step (f) with an aqueous mixture of alkali metal hydroxides at a concentration and at a temperature sufficient to extract the aluminum content from said solid portion,

h. separating the liquid and solid portions of the digestion mixture resulting from step (g),

i. precipitating silica from the liquid portion resulting from step (h),

j. separating the supernatant from the precipitant resulting from step (i),

k. precipitating aluminum hydroxide from the supernatant resulting from step (j), and

l. separating the supernatant from the precipitated aluminum hydroxide resulting from step (k).

4,029,738

DECOMPOSING NITROGEN OXIDES WITH NICKEL-IRON-CHROMIUM CATALYSTS

Philippe Courty, Nanterre; André Sugier, Rueil-Malmaison; Bernard Raynal, Le Pecq, and Georges Berrebi, Massy, all of France, assignors to Societe Francaise des Produits pour Catalyse, Rueil-Malmaison, France

Continuation of Ser. No. 245,771, April 20, 1972, abandoned.
This application Nov. 18, 1974, Ser. No. 524,880
Claims priority, application France, Dec. 2, 1971, 71.43394
Int. Cl.² B01D 53/00
U.S. Cl. 423—213.2 13 Claims

1. In a process for the reduction of nitrogen oxides present in a gaseous mixture containing said nitrogen oxides and a sufficient amount of reducing gas to reduce said nitrogen oxides, said process comprising contacting said gaseous mixture with a catalyst at about 200°–800° C, the improvement wherein said catalyst consists essentially of a carrier on which is deposited, in a proportion of from 3 to 20% of the catalyst weight, a dispersed, homogeneous active phase of mixed oxide of the formula $Ni_x(Fe_yCr_z)O_t$, x has a value from 0.85 to 1.30, the sum $(y + z)$ a value from 1.8 to 2.3, the ratio

$$\frac{y}{y+z}$$

a value in the range of from 0.02:1 to 0.6:1 and t is a positive value from 2 to 6, said active phase being deposited by impregnation of said mixed oxide in dissolved form, whereby said nitrogen oxides are substantially converted into molecular nitrogen.

8. A process as defined by claim 1 wherein said gaseous mixture is an exhaust gas of an internal combustion engine and the reducing gas is selected from the group consisting of carbon monoxide, hydrogen and mixtures thereof.

4,029,739

PROCESS FOR REMOVING NITROGEN OXIDES FROM WASTE GAS

Teizo Senjo, Machida, and Makio Kobayashi, Toyonaka, both of Japan, assignors to Fuji Kasui Engineering Co., Ltd., Tokyo, and Sumitomo Metal Industries, Ltd., Osaka, both of Japan

Filed Dec. 30, 1975, Ser. No. 645,350
Claims priority, application Japan, Jan. 6, 1975, 50-000009
Int. Cl.² C01B 21/00
U.S. Cl. 423—235 11 Claims

1. A process for removing nitrogen oxides including nitrogen monoxide and nitrogen dioxide from a waste gas substantially free of sulfur oxides comprising the steps of:

a. oxidizing the nitrogen monoxide to the nitrogen dioxide by adding a gaseous oxidizing agent to the waste gas, and

b. scrubbing the waste gas with an aqueous scrubbing solution to reduce a nitrogen oxides to nitrogen consisting essentially of:

i. at least 0.5% by weight of at least one sulfur-containing reducing compound selected from the group consisting of sulfites, thiosulfates, sulfides, polysulfides, hydrosulfites and hydrosulfides of alkali metals or ammonium, and

ii. at least 500 ppm by weight of at least one catalytic compound selected from the group consisting of (a) amino compounds having the general formula $R(NH_2)_n$, wherein R represents substituted or unsubstituted hydrocarbon radicals, said substituent being one or more oxygen-, sulfur-, or nitrogen-containing hetero radicls, and n represents a positive integer, (b) nitro compounds having the general formula $R(NO_2)_n$, wherein R represents substituted or unsubstituted hydrocarbon radicals, said substituent being one or more

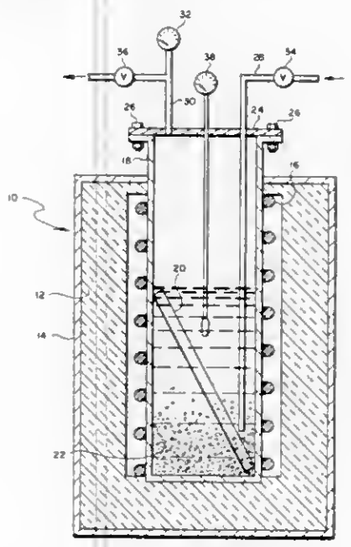
oxygen-, sulfur- or nitrogen-containing hetero radicals and n represents a positive integer and (c) nitroso compounds and hydroxylamino compounds produced by the reduction reaction of said nitro compounds or the oxidation reaction of said amino compounds.

4,029,740

METHOD OF PRODUCING METAL NITRIDES

Guy Ervin, Jr., Northridge, Calif., assignor to Rockwell International Corporation, El Segundo, Calif.

Filed Nov. 24, 1975, Ser. No. 634,687
Int. Cl.² C01F 15/00; C01G 43/00, 56/00
U.S. Cl. 423—251 9 Claims



1. A method of producing a selected nitride comprising the steps of:

a. providing a salt bath in a reaction zone;

b. introducing the selected metal into the salt bath in the presence of gaseous nitrogen;

c. providing a halide of the selected metal in an amount of at least 10 gm per liter of salt;

d. maintaining the salt bath at a temperature above its melting point and below its boiling point for a time sufficient for a desired amount of the selected metal to be reacted and form a precipitate of a nitride of the selected metal;

e. removing the salt from the reaction zone; and

f. recovering the selected metal nitride.

7. A method of producing a selected metal nitride comprising the steps of:

a. providing a molten salt bath in an inert atmosphere in a closed reaction zone;

b. introducing the selected metal into the molten salt bath in the presence of gaseous nitrogen, said selected metal being selected from the group consisting of plutonium uranium, thorium, and mixtures thereof;

c. providing a halide of the selected metal in an amount of at least 10 gms per liter of molten salt;

d. maintaining the molten salt bath at a temperature above its melting point and below its boiling point, said temperature being within the range of from 250° to 900° C, for a time sufficient for a desired amount of the selected metal to be reacted to form a precipitate of a nitride of the selected metal;

e. reducing the pressure in the reaction zone to less than about 10 mm/Hg and increasing the temperature above the boiling point of the salt, said temperature being within the range of from about 500° to 1500° C, for a time sufficient to volatilize the molten salt;

f. removing the volatilized salt from the reaction zone; and

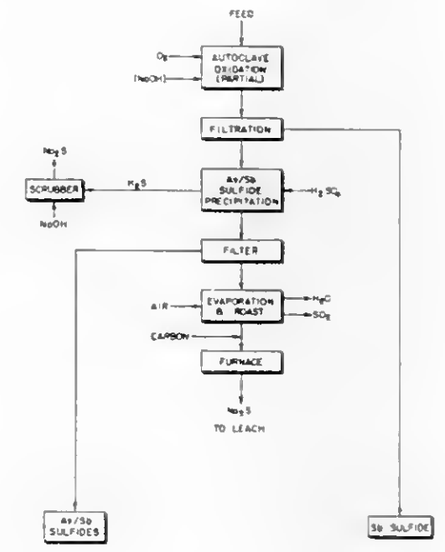
g. recovering the selected metal mononitride as a fine precipitate having a particle size of less than 5 microns.

4,029,741

RECOVERY OF ANTIMONY SULFIDES

Enzo L. Coltrinari, Arvada, Colo., assignor to Tajima Rooling Co., Ltd., Tokyo, Japan

Filed Mar. 1, 1976, Ser. No. 662,597
Int. Cl.² C01B 29/00
U.S. Cl. 423—179 9 Claims



1. A process for recovering antimony sulfides from an aqueous solution comprising thioantimony compounds and thioarsenic compounds, comprising:

subjecting the solution to partial oxidation by injecting sufficient oxygen so as to maintain a final solution e.m.f. of from about 300 millivolts to about 500 millivolts, measured with platinum/saturated Calomel electrodes, while maintaining the product solution at a pH of from about 7 to about 11 in order to oxidize and precipitate a substantial portion of the thioantimony compounds as antimony sulfides while leaving substantially all of the thioarsenic compounds in solution.

4,029,742

PROCESS OF PRODUCING MADDRELL SALT

Klaus Sommer, Heidelberg, and Hermann Weber, Hemsbach, both of Germany, assignors to Benckiser-Knapsack GmbH, Ladenburg (Neckar), Germany

Filed Apr. 6, 1976, Ser. No. 674,123
Claims priority, application Germany, Apr. 9, 1975, 2515370
Int. Cl.² C01B 15/16, 25/26
U.S. Cl. 423—314 12 Claims

1. In a process of producing Maddrell salt, including the steps of heating a starting material selected from the group consisting of mono-sodium orthophosphate, di-sodium pyrophosphate, and mixtures thereof, to a temperature between about 250° C. and about 450° C., whereby said starting material is converted to Maddrell salt, and recovering the Maddrell salt formed, the improvement which comprises carrying out said heating step with an admixture of said starting material

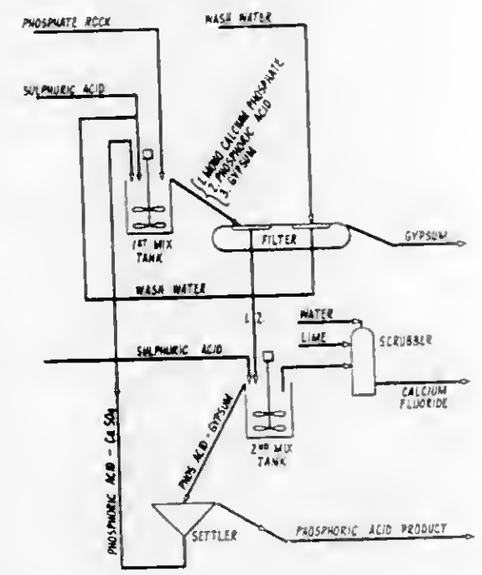
and a phosphoric acid salt of a nitogen-containing base in a catalytically effective amount of between about 0.25% and about 5.0%, by weight, of the starting material, whereby the Maddrell salt containing less than about 2% water-soluble impurities is formed.

4,029,743

PHOSPHORIC ACID MANUFACTURE

Douglas O. Hauge, 930 Acalanes Road, Lafayette, Calif. 94549

Filed Dec. 24, 1975, Ser. No. 644,106
Int. Cl.² C01B *25/22*
U.S. Cl. 423—320 **3 Claims**



1. A process for producing phosphoric acid from rock phosphate which comprises

a. continuously feeding finely divided rock phosphate, sulfuric acid, phosphoric acid and water to a first mixing zone and mixing them to form a slurry,

b. the quantity of sulfuric acid charged being about equal to the quantity stoichiometrically required to convert the calcium phosphate contained in the phosphate rock to monocalcium phosphate and other contained calcium compounds to $CaSO_4$, the quantity of phosphoric acid charged being on a molar basis from about 1.2 to 1.4 times the P_2O_5 content of the rock and the quantity of water charged being equal to 80 to 90 percent by weight of the rock phosphate charged whereby the slurry is characterized by a pH in the range 0.8 to 1.2 and by a calcium ion content in the liquid portion of the slurry about 3–4 percent by weight,

c. continuously withdrawing slurry from said first mixing zone and passing it into a filter zone to separate a filter cake comprising calcium sulfate and a filtrate comprising monocalcium phosphate,

d. passing the filtrate into a second mixing zone and there mixing it with a quantity of sulfuric acid stoichiometrically sufficient to convert the contained monocalcium phosphate to phosphoric acid and calcium sulfate,

e. continuously withdrawing phosphoric acid and calcium sulfate from the second mixing zone and passing them into a settling zone,

f. withdrawing product phosphoric acid from the upper portion of the settling zone,

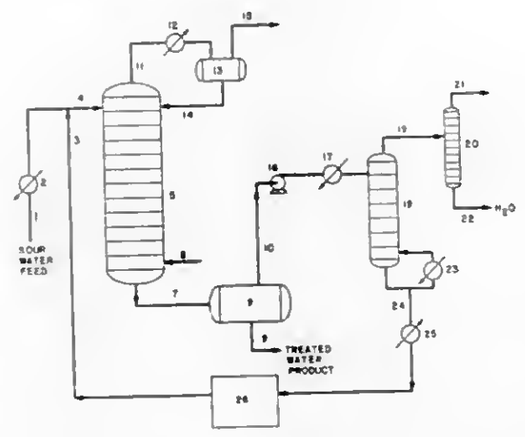
g. withdrawing a slurry of calcium sulfate in phosphoric acid from the lower portion of the settling zone and returning it to the first mixing zone.

4,029,744

PROCESS FOR REMOVING THE SALT OF A WEAK ACID AND A WEAK BASE FROM SOLUTION

Norman N. Li, Edison, and Robert P. Cahn, Millburn, both of N.J., assignors to Exxon Research and Engineering Company, Linden, N.J.

Continuation of Ser. No. 382,466, July 25, 1973, abandoned. This application Apr. 14, 1975, Ser. No. 567,623
Int. Cl.² C01C *1/02*
U.S. Cl. 423—356 **22 Claims**



1. A process for removing the salt of a volatile weak acid and a weak base from aqueous solution which comprises contacting said solution with an emulsion under conditions of agitation, sufficient to maintain the emulsion dispersed in said aqueous solution, said emulsion comprising an exterior phase, said exterior phase being characterized as immiscible with solution and permeable to said weak base, and an interior phase, said interior phase comprising a reactant which is capable of converting said weak base to an impermeable form whereby said weak base permeates through said exterior phase into said interior phase wherein it is converted to a nonpermeable form, and simultaneously removing said volatile weak acid by passing an inert gas through said solution.

3. The process of claim 1 wherein said weak acid is selected from the group consisting of H_2S, SO_2, CO_2, HCN, and phenol.

12. A process for removing the salt of a weak acid and a volatile weak base from aqueous solution which comprises contacting said solution with an emulsion under conditions of agitation, sufficient to maintain the emulsion, said emulsion comprising an exterior phase, said exterior phase being characterized as immiscible with said solution and permeable to said weak acid, and an interior phase, said interior phase comprising a reactant which is capable of converting said weak acid to an impermeable form whereby said weak acid permeates through said exterior phase into said interior phase wherein it is converted to a nonpermeable form, and simultaneously removing said volatile weak base by passing an inert gas through said solution.

15. The process of claim 12 wherein said weak base is selected from the group consisting of ammonia and amines.

PROCESS FOR REDUCING MOLTEN AMMONIUM SULFATES CONTAINING METALLIC IMPURITIES TO AMMONIA AND SULFUR DIOXIDE

Claude Dezael, Maisons Laffitte; Philippe Renault, Noisy le Roi, and André Deschamps, Chatou, all of France, assignors to Institut Francais du Petrole des Carburants et Lubricants et Enterprise de Recherches et d'Activities Petroilers Elf, Rueil-Malmaison, France

Filed July 21, 1975, Ser. No. 597,532
Claims priority, application France, Aug. 1, 1974, 74.27060
Int. Cl.² C01B *17/50;* **C01C** *1/02*
U.S. Cl. 423—356 **7 Claims**

1. In a process for reducing ammonium sulfate containing at least iron sulfate as an impurity, wherein said impure ammonium sulfate is progressively introduced into a reaction zone at 150°–450° C, is reacted in the molten state with molecular sulfur, hydrogen sulfide and/or ammonium thiosulfate to form a sulfur-dioxide containing gas, and the so-formed gas is discharged, the improvement comprising maintaining the iron sulfate content of the impure ammonium sulfate in the reaction zone in the range of 1 to 15% by weight by (a) withdrawing a fraction of said impure ammonium sulfate from said bath at a sufficient rate to maintain the 1–15% by weight concentration of iron sulfate in the reaction zone, (b) treating the withdrawn fraction with water and ammonia so as to precipitate iron compounds, (c) separating the iron compound precipitate from the remaining ammonium sulfate fraction, of low iron content, and (d) feeding back the ammonium sulfate fraction obtained from step (c) to the reaction zone.

4,029,746

MOVABLE PELLETIZING ROLLS

Steven I. Taub, Wilmington, Del., and Frederic J. Osterman, Ardmore, Pa., assignors to IU Conversion Systems, Inc., Philadelphia, Pa.

Filed Nov. 17, 1975, Ser. No. 632,673
Int. Cl.² B29C *15/00*
U.S. Cl. 425—363 **11 Claims**

1. Apparatus for forming and curing compression formed particles comprising continuous particle forming means, said forming means mounted on a mobile mount adapted to move said forming means over a particle curing area with limited vertical clearance between the outlet of said forming means and the surface of said particle curing area, said mounted forming means being adapted to deposit particles formed in said forming means, with minimum drop and handling, substantially throughout said curing area.

4,029,747

METHOD OF PREPARING INORGANIC MONOMERIC AND POLYMERIC COMPLEXES AND PRODUCTS SO PRODUCED

George G. Merkl, Haworth, N.J., assignor to Molecular Energy Research Co., Inc., Houston, Tex.

Continuation-in-part of Ser. No. 527,355, Nov. 26, 1974. This application Nov. 17, 1975, Ser. No. 631,949
Int. Cl.² C01B *21/00*
U.S. Cl. 423—413 **27 Claims**

1. A method of producing an inorganic polymeric complex which comprises:

reacting in an aqueous medium

a. at least one non-alkaline metal selected from Groups I–VIII of the Periodic Table;

b. an alkali metal hydroxide; and

c. a source of reactive NH_2 groups according to the following sequence:

i. introducing a predetermined quantity of said non-alkaline metal into a reaction vessel containing said aqueous medium;

ii. providing in said aqueous medium, a supply of said source of NH_2 groups;

iii. adding said alkali metal hydroxide to said reaction vessel, in the presence of said source of NH_2 groups, in such manner as to provide intimate contact between the alkali metal ions and the non-alkaline metal and a localized area in the immediate vicinity of said non-alkaline metal of pH approaching a value of 14, whereby the non-alkaline metal erodes, producing non-alkaline metal ions in said reaction medium, said non-alkaline metal ions entering into reaction with the alkali metal ions and reactive NH_2 groups to produce an inorganic monomeric complex;

said alkali metal hydroxide being added at a rate sufficient to bind substantial quantities of NH_2 in an overall endothermic reaction with said alkali metal hydroxide and said non-alkaline metal;

iv. thereafter establishing an exothermic reaction in said reaction vessel characterized by increased erosion of said non-alkaline metal and the formation of an inorganic polymeric complex; and

terminating the reaction by removing any unreacted non-alkaline metal from the reaction medium.

IRIDIUM CARBONYL COMPLEXES

Denis Forster, University City; Arnold Hershman, Creve Couer, and Donald E. Morris, Kirkwood, all of Mo., assignors to Monsanto Company, St. Louis, Mo.

Filed July 29, 1974, Ser. No. 492,958
Int. Cl.² C01G *1/04*
U.S. Cl. 423—418 **3 Claims**

1. A solution of dicarbonyldiiodohydridoaquoiridium (III), $[HIr(CO)_2I_2(H_2O)]$, in inert solvent.

2. A process for preparing $[HIr(CO)_2I_2(H_2O)]$ consisting of mixing a solution of [Ir(cyclooctadiene)I_3] with a mixture of hydrogen and carbon monoxide under pressure at elevated temperature, followed by treating the resulting solution with from 1 to 5 moles of water per mole of iridium compound.

3. A process for preparing $[HIr(CO)_2I_2(H_2O)]$ consisting of mixing a solution of [Ir(cyclooctadiene)I] with carbon monoxide and then excess iodine, followed by adding thereto carbon monoxide and hydrogen under pressure at elevated temperature and subsequently treating the resulting solution with from 1 to 5 moles of water per mole of iridium compound.

4,029,749

PROCESS FOR MANUFACTURING NEEDLE COKE

Hisashi Murakami, Tokyo, Japan, assignor to Mitsui Coke Co. Ltd., Tokyo, Japan

Filed Oct. 16, 1975, Ser. No. 622,897
Claims priority, application Japan, Nov. 29, 1974, 49-136165
Int. Cl.² C01B *31/02, 57/04*
U.S. Cl. 423—449 **7 Claims**

1. A process for manufacturing needle coke which comprises crushing coal into comminuted particles; dispersing said comminuted particles into a suitable solvent; subjecting the dispersed particles to hydrogenolysis liquefaction at 360° –480° C and 1–150 Kg/Cm² of hydrogen pressure to obtain a liquefied coal solution; distilling the substantially ashless liquefied coal solution thus obtained at 250°–600° C to remove

solid impurities and unreacted coal therefrom; and coking at least one selected distillate fraction of said distillation in a coking apparatus.

4,029,750

SOLID PARTICULATE LOBULAR $ALCL_3$

Ronald C. Schoener, Lower Burrell, Pa.; Larry K. King; Lester L. Knapp, both of Maryville, Tenn., and Nicholas Kloap, Benton, Ark., assignors to Aluminum Company of America, Pittsburgh, Pa.

Continuation of Ser. No. 180,277, Sept. 14, 1971, abandoned. This application Aug. 26, 1974, Ser. No. 500,757

Int. Cl.² C01F *7/56, 7/58;* **B01D** *7/00*

U.S. Cl. 423—495 **7 Claims**

1. Solid lobular $AlCl_3$ of essentially curvilinear contour compositely constituted of autogeneously bonded pluralities of smaller sized particles of essentially spheroidate character and characterized by the absence of planar exterior surfaces and sharp proturberant angles.

4,029,751

PROCESS FOR PRODUCING SULFURIC ACID

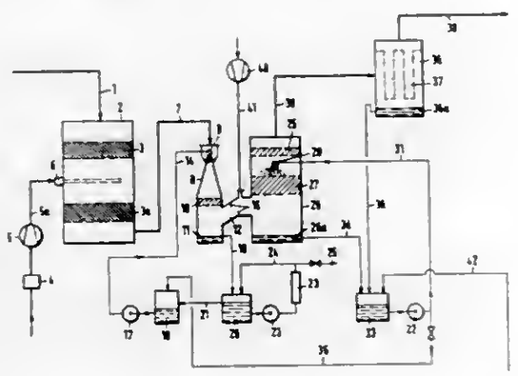
Karl-Heinz Dörr, Mainz; Hugo Grimm, Frankfurt am Main; Waldemar Weber; Michael Tacke, both of Offenbach, and Georg Schmidt, Frankfurt-Nied, all of Germany, assignors to Metallgesellschaft Aktiengesellschaft, Frankfurt am Main, Germany

Filed Dec. 29, 1975, Ser. No. 645,125

Claims priority, application Germany, May 5, 1975, 2519928

Int. Cl.² C01B *17/76;* **B01D** *53/00*

U.S. Cl. 423—522 **8 Claims**



1. In the contact process for producing sulfuric acid from undried feed gases where a SO_3-containing humid gas is produced, said gas is directly cooled with aqueous sulfuric acid, sulfuric acid is condensed in the gases cooled below the dew point of the sulfuric acid, and the water not required to form sulfuric acid is discharged as water vapor with the end gases, the improvement which comprises

i. adding sulfuric acid of 70–95% by weight to cocurrently flowing, SO_3-containing humid gases so that the latter are directly cooled to 120°–230° C;

ii. collecting a major part of the sulfuric acid in a sump;

iii. indirectly cooling a partial stream of the collected sulfuric acid and then recycling to the SO_3-containing gases;

iv. discharging the other part of the sulfuric acid as product acid;

v. admixing cold air to the cooled gases, subsequently treating the gas-air mixture with dilute sulfuric acid of 5–70% by weight and collecting and diluting further the dilute sulfuric acid by an addition of water;

vi. recycling a partial stream of the further diluted sulfuric acid to the gas-air mixture while adding the other part of further diluted sulfuric acid to the recycled acid of 70–95% by weight;

vii. controlling the rates at which air and water are added so that the exhaust gas which has been treated with the dilute sulfuric acid has a temperature which is harmless for the succeeding mist collecting units, the treatment with the dilute sulfuric acid resulting in an evaporation of water substantially at the rate at which it is added; and

viii. collecting the acid mists from the exhaust gas in a mist collector.

4,029,752

METHOD OF PRODUCING SULFUR FROM SULFUR DIOXIDE

Robert P. Cahn, Millburn, N.J., assignor to Exxon Research and Engineering Company, Linden, N.J.

Continuation-in-part of Ser. No. 364,888, May 29, 1973, abandoned. This application Apr. 22, 1974, Ser. No. 462,747

Int. Cl.² C01B *17/16*

U.S. Cl. 423—563 **22 Claims**

1. A method for thermally reducing sulfur dioxide comprising the step of reacting sulfur dioxide with gaseous ammonia at a molar ammonia/sulfur dioxide ratio of at least 4:3 at a temperature above about 1200° F. such that one or more compounds selected from the group consisting of elemental sulfur and hydrogen sulfide are produced.

4,029,753

SULFUR PLANT TEMPERATURE CONTROL

David K. Beavon, Pasadena, Calif., assignor to Ralph M. Parsons Company, Pasadena, Calif.

Filed Jan. 12, 1976, Ser. No. 648,198

Int. Cl.² C01B *17/04*

U.S. Cl. 423—574 R **8 Claims**

1. In a Claus process for the production of sulfur wherein a gaseous stream comprising hydrogen sulfide is combined with a source of oxygen in a flame zone in proportions to convert, by combustion, sufficient hydrogen sulfide to sulfur dioxide to form, with hydrogen sulfide added in a thermal conversion zone, a reaction gas stream wherein the mole ratio of hydrogen sulfide to sulfur dioxide is about 2:1, passing the reactive gas stream through the thermal converison zone where at a temperature above the dew point of sulfur, sulfur is thermally formed by reaction of a portion of the hydrogen sulfide with sulfur dioxide, from which the formed sulfur is condensed to form a residual gas stream, and wherein additional sulfur is formed by passing the residual gas stream through a plurality of catalytic conversion stages in series, and wherein the residual as stream is heated to a temperature sufficient to initiate catalytic reaction of hydrogen sulfide and sulfur dioxide prior to each stage, and formed sulfur is condensed following each catalytic conversion stage in a sulfur condensation stage, the improvement which comprises heating the residual gas stream to the catalytic initiation temperature by indirect heat exchange with high pressure steam generated by indirect flash heating of water in the flame zone to form steam at a pressure of at least about 600 psig, the quantity of steam formed being sufficient to at least heat the residual gas stream between each sulfur condensation and catalytic sulfur formation stage to a temperature required to initiate the catalytic reaction of sulfur dioxide with hydrogen sulfide to form elemental sulfur.

4,029,754

PROCESS FOR PRODUCING HYDROGEN AND OXYGEN

Shoichi Sata, Mito, and Yasumasa Ikezoe, Tokai, both of Japan, assignors to Japan Atomic Energy Research Institute, Tokyo, Japan

Filed July 11, 1975, Ser. No. 595,324

Claims priority, application Japan, July 18, 1974, 49-82547

Int. Cl.² C01B *13/02, 1/02*

U.S. Cl. 423—579 **4 Claims**

1. A process for producing hydrogen and oxygen from water, at temperatures not higher than 1000° C, comprising the steps of:

1. reacting manganese (II) chloride with carbon dioxide at a temperature higher than 550° C to obtain manganese (II) oxide, carbon monoxide and chlorine;

2. reacting the carbon monoxide obtained as a result of step (1) with water vapor to produce carbon dioxide and hydrogen;

3. reacting the manganese (II) oxide obtained as a result of step (1) with hydrogen chloride to produce manganese (II) chloride; and

4. reacting the chlorine obtained as a result of step (1) with water vapor to produce hydrogen chloride and oxygen.

TRANSPARENT ULTRAFINE GRAINED CERAMICS

George E. Gazza, Sudbury, and Sunil K. Dutta, Waltham, both of Mass., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Division of Ser. No. 224,244, Feb. 7, 1972, Pat. No. 3,767,745, which is a continuation-in-part of Ser. No. 81,612, Oct. 16, 1970, abandoned. This application Apr. 11, 1973, Ser. No. 350,287

Int. Cl.² C01F *7/04*

U.S. Cl. 423—600 **1 Claim**

1. Light-transparent ultrafine grained lithium aluminate made by a method of cold-pressing a lithium aluminate powder having a cubic crystal structure and having the formula $LiAl_5O_8$, to form a compact, followed by pressing the compact; said method comprising the steps of:

cold-compressing said lithium aluminate powder to about 40–50% of theoretical density to form a compact,

heating the compact under a vacuum to about 600° C to remove undesired gases,

raising the temperature of said compact to about 1,150° C, applying a pressure of about 6000–7000 p.s.i., maintaining said compact at said temperature and pressure for about 50–60 minutes, further raising the temperature of said compact to about 1,600° C in isothermal increments of about 50° C under said pressure while maintaining the temperature at each incremental increase for a period of about 50–60 minutes, and recovering a full-density light-transparent product having a grain of about 1 micron.

4,029,756

SEROLOGICAL PROCEDURE FOR DETERMINING PRESENCE OF NEISSERIA GONORRHOEAE ANTIBODIES

Hassan A. Gaafar, Slingerlands, N.Y., assignor to Research Corporation, New York, N.Y.

Filed Nov. 26, 1975, Ser. No. 635,325

Int. Cl.² A61K *43/00, 39/02;* **G01N** *31/00, 33/16*

U.S. Cl. 424—1 **13 Claims**

1. A serological method for determining the presence of *Neisseria gonorrhoeae* antibodies in human serum which comprises heating the serum at about 56° C. to 65° C. for from about 15 to 40 minutes, the serum being undiluted or diluted with physiological saline at a dilution up to about 1:1000; adding the serum to about an equal volume of *Neisseria meningitides* sorbent composition containing from 0.1 to 100 sorbent units of *Neisseria meningitides* antigen to remove cross reacting antibodies and thereafter mixing and incubating resulting mixture with a composition containing a heat labile *Neisseria gonorrhoeae* antigen produced from a culture of *Neisseria gonorrhoeae* antigen to form *Neisseria gonorrhoeae* antigen-antibody conjugate when said antibodies are present and detecting the presence of such conjugate.

4,029,757

MANUFACTURE OF PHARMACEUTICAL UNIT DOSAGE FORMS

Arthur Roman Mlodozeniec, Montclair, and Lawrence Samuel White, Ramsey, both of N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J.

Filed Dec. 15, 1975, Ser. No. 640,652

Int. Cl.² A61K *9/70;* **B32B** *33/00*

U.S. Cl. 424—27 **4 Claims**

1. A method of preparing solid pharmaceutical unit dosage forms comprising loading one or more medicaments to a therapeutically inert, edible web, fabricating said web into a solid geometric form of predetermined dimensions having said medicament substantially internalized, said form being divisible into a plurality of unit dosage forms, unitizing said geometric form into said plurality of unit dosage forms and sealing said unit dosage forms to completely internalize said medicament wherein said procedures include at least one non-destructive testing operation to assure uniform quality of said unit dosage forms, wherein said fabrication procedure comprises fan folding a continuous web structure comprising at least one pair of layers of web having medicament loaded to the facing surfaces thereof and subjecting said stack to pressure to densify and shape same into a continuous rod-like geometric form.

4,029,758

PREPARATION OF PHARMACEUTICAL UNIT DOSAGE FORMS

Arthur Roman Mlodozeniec, and Arthur H. Goldberg, both of Montclair, N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J.

COMPOSITION FOR APPLICATION TO THE ANIMAL BRAIN FOR SYNTHESIS OF BRAIN COMPONENTS INVOLVED IN THE LEARNING PROCESS, AND METHOD

Nathar W. Penn, 453 Glendale Road, Wyckoff, N.J. 07481

Filed Mar. 16, 1971, Ser. No. 124,959

Int. Cl.² A61K *35/12*

U.S. Cl. 424—95 **2 Claims**

1. A method of obtaining a composition adapted for use by injection into the animal organism for topical action upon the animal brain to produce synthesis of brain components involved in the learning process, comprising deoxyribonucleic acid which contains 5 Hydroxymethylcytosine, with substantial inhibiting of enzymes and chemical degradents, said method comprising the steps of homogenizing an animal brain in a solution of sodium bromide, potassium citrate, sodium arsenite, sodium deoxycholate and glutathione, precipitating DNA with alcohol, transferring the resultant precipitate to the aforesaid solution form but omitting the sodium bromide and subjecting said precipitate to further homogenizing, followed by the consecutive additional steps, namely:

a. Transferring the said precipitated solids thus treated to a solution which is the same as that first stated but omitting the sodium bromide and the sodium deoxycholate and reducing concentration of glutathione; and stirring the solution in the presence of an active precipitant and thereby forming a white precipitant

b. The white precipitant is dissolved in a solution of the same form as that stated in (a) together with lysozyme the latter having been purified by a water bath.

c. The white precipitate of deoxyribonucleic acid and lysozyme in its solvent is stirred, centrifuged, and the supernatent solution is discarded and the precipitated solids are washed with a solution composition as in (a) above and then dissolved in a solution the same as that stated above for hydrogenation but with lower sodium bromide concentration and precipitated with alcohol and by such action is formed a white precipitate of deoxyribonucleic acid, while the lysozyme is discarded; the precipitate then is transferred to a solution which is identical to that used after the last named homogenation step, dissolved and further purified by treatment with chloroform-isomethyl alcohol mixture; then the solution of deoxyribonucleic acid is precipitated with alcohol, dissolved in dilute citrate, physiological sodium chloride-chloride - 0.14M, and dilute glutathione. Finally the composition is precipitated with alcohol from said solution.

ANTIBIOTIC A-35512B AGLYCONE

Manuel Debono, Indianapolis, Ind., assignor to Eli Lilly and Company, Indianapolis, Ind.

Filed May 24, 1976, Ser. No. 689,273

Int. Cl.² A61K *35/74*

U.S. Cl. 424—118 **2 Claims**

1. A-35512B aglycone, which in its hydrochloride form is a white amorphous compound having these characteristics:

a. an approximate elemental composition of 54.29 percent carbon, 4.34 percent hydrogen, 7.40 percent nitrogen, 28.95 percent oxygen, and 5.02 percent chlorine;

b. an infrared absorption spectrum in Nujol mull with significant absorption maxima at the following frequencies (cm^{-1}): 3440 (shoulder), 3340 (shoulder), 3215 (strong), 2950 (shoulder), 2910 (strong), 2840 (strong), 2640 (shoulder), 1735 (weak), 1655 (strong), 1590 (medium), 1500 (strong), 1460 (strong), 1378 (medium), 1365 (shoulder), 1298 (medium), 1215 (medium), 1155 (medium), 1120 (shoulder), 1105 (weak), 1060 (weak), 1040 (weak), 1008 (medium), 925 (weak), 875 (weak), 765 (shoulder), and 718 (weak);

c. ultraviolet absorption spectra, in acidic and neutral methanol, with an absorption maximum at 282 nm ($E_{1cm}^{1\%}$ 102.62) and, in basic methanol, an absorption maximum at 302 nm ($E_{1cm}^{1\%}$ 182.09);

d. a molecular weight of about 1282, as determined by titration;

e. three titratable groups in 66% aqueous dimethylformamide with pK_a values of approximately 7.5, 9.25, and 11.0;

f. the following specific rotations:
$[\alpha]_D^{25}$ −178° (c 5, CH_3OH)
$[\alpha]_{365}^{25}$ −716.8° (c 5, CH_3OH).

g. is soluble in water and methanol, but is insoluble in benzene, chloroform, acetone, diethyl ether, ethyl acetate, toluene, hexane, acetonitrile and dioxane;

h. an amino-acid analysis indicating the presence of at least four amino-acid residues:

i. an R_f value of approximately 0.80 on cellulose thin-layer chromatography (aluminum support) in a 1-butanol:pyridine-acetic acid:water (15:10:3:12) solvent system, using *Sarcina lutea* as the detection organism;

j. an R_f value of approximately 0.26 on silica gel thin-layer chromatography, in a methanol: chloroform-conc.NH_4OH (3:2:1) solvent system;

k. a ^{13}C nuclear-magnetic-resonance spectrum in (methyl sulfoxide)-d_6 with the following characteristics:

No.	PPM	Height (%)
1	187.8	37.2
2	172.0	40.9

46	0.0	43.7

l. contains a 3-amino-2,3,6-trideoxy-3-C-methyl-L-xylo-hexopyranose moiety;

m. has at least one hydroxyl group capable of esterification;

and which in its free-base form is a white amorphous compound having these characteristics:

a'. an approximate elemental composition of 52.65% carbon, 4.57% hydrogen, 6.91% nitrogen, 27.04% oxygen, and 2.94% chlorine;

b'. an infrared absorption spectrum in KBr pellet with significant absorption maxima at the following frequencies (cm^{-1}): 3360 (strong), 3260 (shoulder), 2940 (shoulder), 1735 (shoulder), 1660 (strong), 1598 (medium), 1510 (strong), 1440 (medium), 1295 (weak), 1215 (medium), 1165 (medium), 1122 (weak), 1070 (weak), 1018 (strong), 940 (weak), and 920 (weak);

c'. ultraviolet absorption spectra with an absorption maximum, in acidic and neutral methanol, at 282 nm ($E_{1cm}^{1\%}$ 43.65) and, in basic methanol, at 301 nm ($E_{1cm}^{1\%}$ 67.46);

d'. five titratable groups in 66% aqueous dimethylformamide with pK_a values of approximately 6.2, 8.2, 10.1, 11.4, and 12.4;

e'. the following specific rotation: $[\alpha]_D^{25}$ −64.5° (c 3, methyl sulfoxide);

or a pharmaceutically-acceptable acid-addition salt of A-35512B aglycone.

METHOD OF THERAPEUTICALLY TREATING DAMAGED AND/OR INFECTED TISSUE AND RELIEVING STRESS AND SHOCK IN WARM BLOODED ANIMALS

John W. Willard, Sr., Rapid City, S. Dak., assignor to CAW Industries, Inc., Rapid City, S. Dak.

Division of Ser. No. 455,022, March 26, 1974, Pat. No. 3,984,540, which is a continuation-in-part of Ser. No. 317,097, Dec. 20, 1972, Pat. No. 3,893,943, which is a continuation of Ser. No. 108,198, Jan. 20, 1971, abandoned. This application Aug. 6, 1976, Ser. No. 712,158

Int. Cl.² A61K *33/00, 33/06, 33/08*

U.S. Cl. 424—127 **18 Claims**

1. A method of treating infected and damaged tissue and relieving stress and shock in warm blooded animals comprising administering thereto a therapeutically effective amount of a catalyst,

the catalyst being prepared by a process comprising

admixing a water soluble alkali metal silicate with an aqueous medium containing a dissolved substance which is a source of calcium ion and dissolved substance which is a source of magnesium ion,

The aqueous medium containing said dissolved substances in amounts to provide between about 1×10^{-4} and 1×10^{-1} mole per liter each of calcium ion and magnesium ion,

the aqueous medium containing said dissolved substances in amounts to provide a molar ratio of calcium ion to magnesium ion between about 2.0:1.0 and 1.0:2.0,

the alkali metal silicate having an alkali metal oxide to silicon dioxide ratio between about 0.9:1.0 and less than 2.0:1.0 and being admixed with the aqueous medium in an amount of about 0.05–2 moles per liter,

reacting the alkali metal silicate with said dissolved substances providing calcium ion and magensium ion to produce an aqueous suspension of finely divided particles of the reaction product,

admixing a micelle-forming surfactant with the aqueous medium in an amount to form catalyst micelles comprising said finely divided particles of the reaction product upon agitating the aqueous medium, and

agitating the aqueous medium containing the finely divided particles of the reaction product and surfactant to form said catalyst micelles.

PEPTIDE CARBAZATES

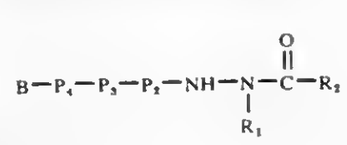
Conrad P. Dorn, Plainfield, and Shu S. Yang, Piscataway, both of N.J., assignors to Merck & Co., Inc., Rahway, N.J.

Filed Dec. 23, 1975, Ser. No. 643,722

Int. Cl.² A61K *37/00*

U.S. Cl. 424—177 **8 Claims**

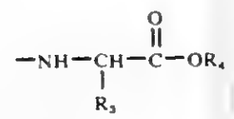
1. A compound of the formula:



I

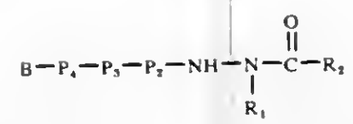
wherein

B is $C_{1\text{-}5}$alkanoyl, t-butoxycarbonyl or carbobenzyloxy,
P_4 is alanyl or prolyl,
P_3 is alanyl,
P_2 is prolyl or leucyl
R_1 is $C_{1\text{-}5}$alkyl,
R_2 is $C_{1\text{-}5}$alkoxy, benzyloxy or amino $C_{1\text{-}5}$alkoxy



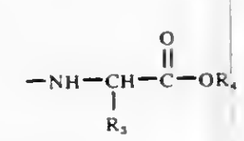
wherein
R_3 is $C_{1\text{-}5}$alkyl or benzyl, and
R_4 is $C_{1\text{-}5}$alkyl, or benzyl.

8. A method of treating pancreatitis, which comprises administering to a patient a therapeutically effective amount of a compound of the formula:



I

wherein
B is $C_{1\text{-}5}$alkanoyl, t-butoxycarbonyl or carbobenzyloxy,
P_4 is alanyl or prolyl,
P_3 is alanyl,
P_2 is prolyl or leucyl,
R_1 is $C_{1\text{-}5}$alkyl,
R_2 is $C_{1\text{-}5}$alkoxy, benzyloxy or amino $C_{1\text{-}5}$alkoxy



wherein
R_3 is $C_{1\text{-}5}$alkyl or benzyl, and
R_4 is $C_{1\text{-}5}$alkyl, or benzyl.

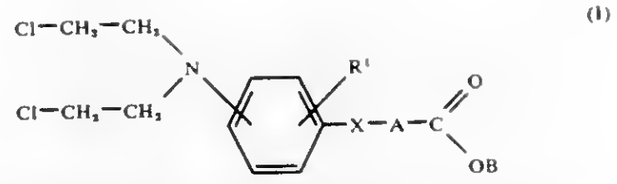
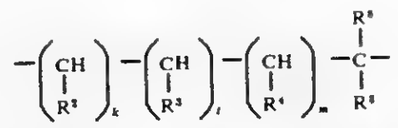
1. A pharmaceutical composition, comprising from about 0.01 to about 75 weight percent of a corticoid steroid 21-ester of the general formula

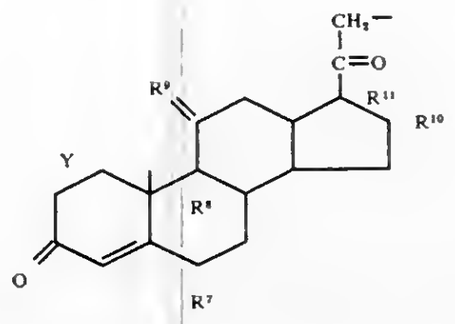


(I)

wherein R^1 is hydrogen, lower-alkyl, halogen or lower-alkoxy;
X is oxygen, sulphur or a monovalent carbon-carbon bond;
A represents the group



wherein R^2, R^3, R^4, R^5 and R^6 represent similar or dissimilar atoms or atom groups selected from the group consisting of hydrogen and lower-alkyl, and wherein R^6 can also be selected from the group consisting of amino and lower-alkanoylamino, in which case R^5 is hydrogen,
wherein *k*, *l* and *m* are integers having a value of zero or one, or A together with X (—X—A) represents a monovalent carbon-carbon bond; and B represents the radical of a corticoid steroid of the formula



wherein Y is a carbon-carbon single bond or a carbon-carbon double bond;
R^7 is hydrogen, methyl or F;
R^8 is hydrogen or F;
R^9 is oxygen or the group

R^{10} is hydrogen, methyl or hydroxy;
R^{11} is hydrogen or hydroxy; and wherein R^{10} and R^{11} together can form an alkylidenedioxy group and a pharmaceutical carrier.

Karl Gätzi, and Karl Hoegerle, both of Basel, Switzerland, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

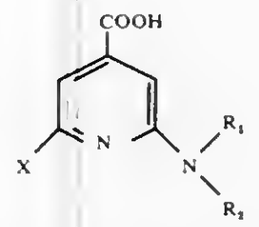
Filed Dec. 12, 1974, Ser. No. 532,145

Claims priority, application Switzerland, Dec. 17, 1973, 17663/73

Int. Cl.² C07D *213/79*; A01N *9/22*

U.S. Cl. 424—248.53 32 Claims

1. A compound of the formula



wherein

X represents chlorine, bromine or iodine,

R_1 represents C_1–C_{12} alkyl, C_1–C_{12} hydroxyalkyl, C_1–C_{12} alkyl substituted by C_1–C_4 alkoxy, C_1–C_{12} aminoalkyl, C_1–C_{12} alkyl substituted by mono- or di-(C_1 or C_2 alkyl-)amino, C_3 or C_4 alkenyl, C_3–C_8 cycloalkyl, benzyl, p-acetylbenzyl or phenethyl, and

R_2 represents hydrogen, C_1–C_4 alkyl, or C_3 or C_4 alkenyl, or

R_1 and R_2 taken together with the nitrogen atom to which they are attached represent morpholino, piperidino or pyrrolidino, or a salt thereof with a suitable organic or inorganic base.

18. A method for inhibiting the growth of phytopathogenic fungi and bacteria which comprises applying thereto an effective amount of a compound according to claim 1.

4,029,786

MORPHOLINE DERIVATIVES FOR TREATING DEPRESSION

Edwin Harry Paterson Young, Macclesfield, England, assignor to Imperial Chemical Industries Limited, London, England

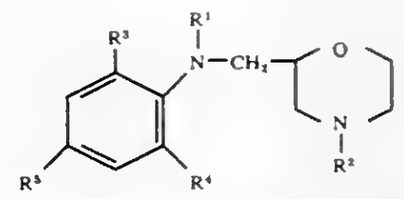
Division of Ser. No. 387,378, Aug. 10, 1973, Pat. No. 3,974,158. This application June 1, 1976, Ser. No. 691,298

Claims priority, application United Kingdom, Aug. 11, 1972, 37550/72

Int. Cl.² A61K *31/535*

U.S. Cl. 424—248.56 4 Claims

1. A pharmaceutical composition for treating or preventing depression which comprises as active ingredient an effective amount of morpholine selected from a compound of the formula:



wherein R^1 is hydrogen or hydrocarbon aryloxycarbonyl of up to 11 carbon atoms; R^2 is hydrogen or alkyl of 1 to 6 carbon atoms; and R^3, R^4 and R^5, which may be the same or different, are hydrogen, halogen, alkyl or alkylthio of 1 to 6 carbon atoms, halogenoalkyl of 1 to 3 carbon atoms, alkoxy of 1 to 10 carbon atoms, alkenyloxy or alkoxycarbonyl of up to 6 carbon atoms, hydrocarbon aroyl of up to 11 carbon atoms, hydrocarbon aryl, hydrocarbon aryloxy or hydrocarbon arylthio of up to 10 carbon atoms; and a non-toxic pharmaceutically-acceptable acid-addition salt thereof, in association with a major amount of a non-toxic, pharmaceutically-acceptable diluent or carrier.

4,029,787

BASICALLY SUBSTITUTED 3-SULFAMOYLBENZOIC ACID DERIVATIVES AND PROCESS FOR THEIR PREPARATION

Karl Sturm, Heidesheim, and Franz Starey, Frankfurt am Main, both of Germany, assignors to Hoechst Aktiengesellschaft, Frankfurt am Main, Germany

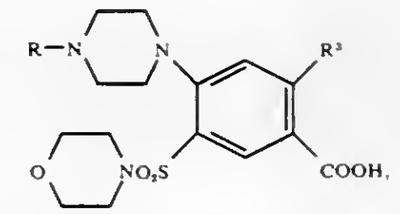
Filed Sept. 4, 1975, Ser. No. 610,388

Claims priority, application Germany, Sept. 6, 1974, 2442851

Int. Cl.² C07D *413/02*; A61K *31/535*

U.S. Cl. 424—248.53 4 Claims

1. A basically-substituted 3-morpholinosulfonyl benzoic acid of the formula



salts thereof with physiologically tolerable acids, and salts thereof with physiologically tolerable bases, wherein R is hydrogen, alkyl having 1 to 6 carbon atoms, or benzyl, and R^3 is hydrogen, halogen, or alkyl having 1 to 4 carbon atoms.

4. A method for treating high blood pressure in a patient suffering therefrom which comprises administering an effective amount of a compound as in claim 1.

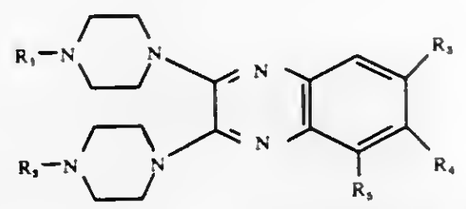
4,029,788

2,3-BIS(4-ALKYL-1-PIPERAZINYL)QUINOXALINES

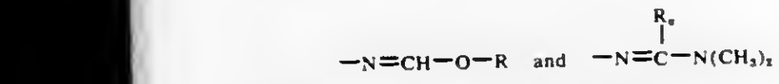
Paul Frank Fabio, Pearl River; Yang-I Lin, Nanuet; Stanley Albert Lang, Jr., Stony Point, all of N.Y., and Andrew Stephen Tomcufcik, Old Tappan, N.J., assignors to American Cyanamid Company, Stamford, Conn.

Filed July 16, 1976, Ser. No. 706,027
Int. Cl.² A61K *31/495*; C07D *295/00*
U.S. Cl. 424—250 17 Claims

1. A compound selected from the group consisting of those of the formula:

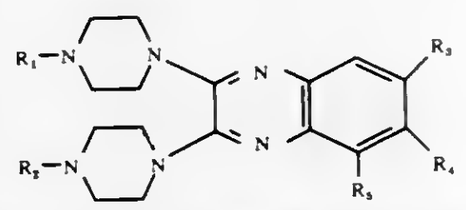


wherein R_1 and R_2 are the same and are lower alkyl; R_3 is hydrogen or halogen; and R_4 and R_5 are each individually selected from the group consisting of hydrogen, amino-p-toluenesulfonamido, 4-(3-dimethylaminopropyl)-piperidinomethyleneamino, and moieties of the formulae:

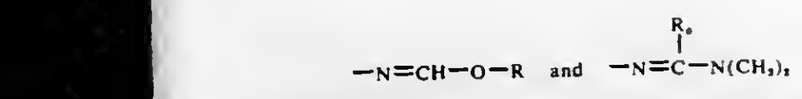


wherein R is lower alkyl and R_6 is hydrogen or lower alkyl, with the proviso that at least one but not both of R_4 and R_5 must be hydrogen; and the pharmacologically acceptable acid-addition and quanternary ammonium salts thereof.

10. A method of treating a mammal to eliminate cecal and hepatic amebae therefrom which comprises administering to said mammal an effective amount of a compound selected from the group consisting of those of the formula:



wherein R_1 and R_2 are the same and are lower alkyl; R_3 is hydrogen or halogen; and R_4 and R_5 are each individually selected from the group consisting of hydrogen, amino, p-toluenesulfonamido, 4-(3-dimethylaminopropyl)-piperidinomethyleneamino, and moieties of the formulae:



wherein R is lower alkyl and R_6 is hydrogen or lower alkyl, with the proviso that at least one but not both of R_4 and R_5 must be hydrogen; and the pharmacologically acceptable acid-addition and quaternary ammonium salts thereof.

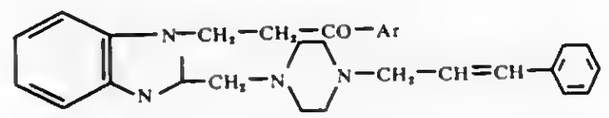
4,029,789

1-[2'-(α-FUROYL OR α-THIENOYL)ETH-1'-YL]-2-(4''-CINNAMYL PIPERAZIN-1''-YL METHYL)BENZIMIDAZOLES AND METHOD OF USING SAME

Claude P. Fauran; Nicole Dorme; Guy M. Raynaud, all of Paris, and Jeannine Eberle, Chatou, all of France, assignors to Delalande S.A., Courbevoie, France

Filed Nov. 20, 1975, Ser. No. 633,960
Claims priority, application France, Nov. 21, 1974, 74.38292
Int. Cl.² A61K *31/34*, *31/38*
U.S. Cl. 424—250 7 Claims

1. A compound having the formula



in which Ar is α-furyl or α-thienyl, and the pharmacologically acceptable acid addition salts thereof.

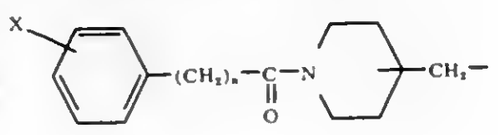
4,029,790

1-BENZOYL-2 OR 4 [2-(4-PHENYL-PIPERAZINO)-ETHYL]-PIPERIDINES

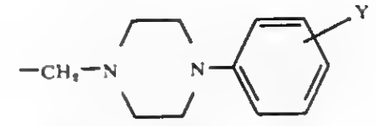
Roland Yves Mauvernay, Riom; Norbert Busch, Loubeyrat; Jacques Moleyre, Mozac; Jacques Simond, Chamalieres, and Andre Monteil, Gerzat, all of France, assignors to Centre European de Recherches Mauvernay, Riom, France

Filed Sept. 26, 1975, Ser. No. 617,141
Claims priority, application France, Sept. 30, 1974, 74.32805
Int. Cl.² A61K *31/495*; C07D *401/06*
U.S. Cl. 424—250 9 Claims

1. A compound of the formula:

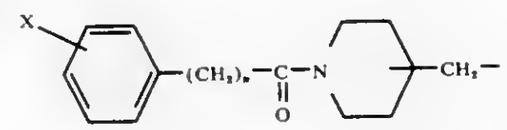


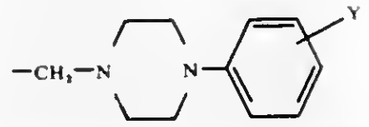
(I)



and salts thereof with pharmaceutically acceptable acids in which X represents a hydrogen or halogen atom or methoxy group, *n* is 0; Y represents a halogen atom; and the ethyl piperazine moiety is attached to the 2- or 4- position of the piperidine ring.

8. A pharmaceutical composition consisting essentially of a compound of





and salts thereof with pharmaceutically acceptable acids in which X represents a hydrogen or halogen atom or a lower alkoxy group, *n* is 0; Y represents a halogen atom; and the

ethyl piperazine moiety is attached to the 2- or 4- position of the piperidine ring in association with a pharmaceutically acceptable carrier or diluent.

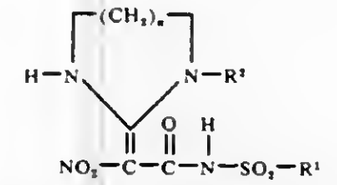
4,029,791

N-(ARYLSULFONYL)-2-NITRO-2-(1-METHYL-2-(1,3-DIAZACYCLOALKYLIDENE)ACETAMIDES

Willy D. Kollmeyer, Modesto; Steven A. Roman, Oakdale, and Samuel B. Soloway, Modesto, all of Calif., assignors to Shell Oil Company, Houston, Tex.

Filed June 17, 1976, Ser. No. 696,992
Int. Cl.² C07D *233/26*
U.S. Cl. 424—251 5 Claims

1. A compound of the formula:



wherein R^1 is phenyl or phenyl substituted by from one to two of one or more of halogen, nitro, cyano, alkyl or alkoxy of from 1 to 6 carbon atoms or phenoxy, R^2 is alkyl or cyanoalkyl of from 1 to 3 carbon atoms, allyl, 3-chloroallyl, 2-(methylthio)ethyl or propargyl, and *n* is zero or 1.

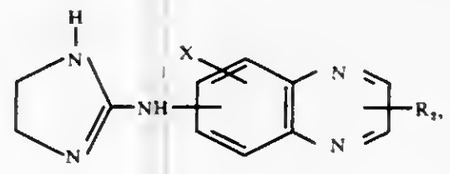
4,029,792

(2-IMIDAZOLIN-2-YLAMINO) SUBSTITUTED -QUINOXALINES AND -QUINAZOLINES AS ANTIHYPERTENSIVE AGENTS

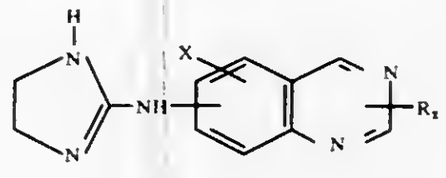
John C. Danielewicz, Ash; Michael Snarey, Sandwich, and Geoffrey N. Thomas, Deal, all of England, assignors to Pfizer Inc., New York, N.Y.

Continuation-in-part of Ser. No. 551,318, Feb. 20, 1975, abandoned, which is a division of Ser. No. 332,485, Feb. 14, 1973, Pat. No. 3,890,319. This application Sept. 16, 1975, Ser. No. 613,808
Claims priority, application United Kingdom, Nov. 8, 1972, 51629/72; Feb. 29, 1972, 9196/72
Int. Cl.² A61K *31/505*, *31/495*
U.S. Cl. 424—251 9 Claims

1. A method for the treatment of hypertension which comprises orally or parenterally administering to a hypertensive host an antihypertensive amount of a compound selected from the group consisting of:



I



II

and the pharmaceutically acceptable acid addition salts thereof wherein X is selected from the group consisting of hydrogen, halogen, lower alkyl, lower alkoxy and trifluoromethyl and R_2 is selected from the group consisting of hydrogen, lower alkyl and lower alkoxy.

4,029,793

SYNERGISTIC LOCAL ANESTHETIC COMPOSITIONS

Herbert J. F. Adams, Westboro, and Bertil H. Takman, Worcester, both of Mass., assignors to Astra Pharmaceutical Products, Inc., Worcester, Mass.

Division of Ser. No. 369,302, June 12, 1973, Pat. No. 3,966,934, which is a continuation-in-part of Ser. No. 206,181, Dec. 8, 1971, abandoned, which is a continuation-in-part of Ser. No. 109,942, Jan. 26, 1971, abandoned. This application Dec. 9, 1975, Ser. No. 639,244
Int. Cl.² A61K *31/505*
U.S. Cl. 424—251 12 Claims

1. An injectable local anesthetic composition having long-lasting local anesthetic effect which is a solution consisting essentially of a pharmaceutically acceptable carrier having dissolved therein

a. a heterocyclic aminoacyl anilide local anesthetic compound in a concentration of from 0.05 to 5% by weight of the carrier and

b. a toxin selected from the group consisting of from 0.5 to 10 micrograms of tetrodotoxin per milliliter of the carrier and from 10 to 20 micrograms of desoxytetrodotoxin per milliliter of the carrier.

4,029,794

PHARMACEUTICAL LOCAL ANESTHETIC COMPOSITION

Herbert J. F. Adams, Westboro, and Bertil H. Takman, Worcester, both of Mass., assignors to Astra Pharmaceutical Products, Inc., Worcester, Mass.

Division of Ser. No. 369,147, June 12, 1973, Pat. No. 3,957,996, which is a continuation-in-part of Ser. No. 206,182, Dec. 8, 1971, abandoned, which is a continuation-in-part of Ser. No. 109,942, Jan. 26, 1971, abandoned. This applicatioo Dec. 8, 1975, Ser. No. 638,937
Int. Cl.² A61K *31/52*
U.S. Cl. 424—253 22 Claims

1. An injectable local anesthetic composition having long-lasting local anesthetic effect which is a solution consisting essentially of a pharmaceutically acceptable carrier having dissolved therein

a. an aminoalkyl benzoate local anesthetic compound in a concentration of from 0.05% to 5% by weight of the carrier and

b. from 0.5 to 10 micrograms of saxitoxin per milliliter of the carrier.

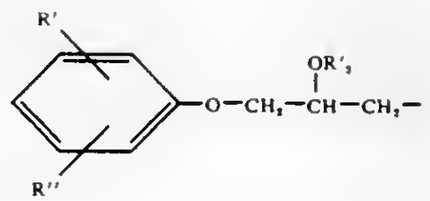
4,029,795

4(2' ISOQUINOLIN-1-ONE)PIPERIDINES

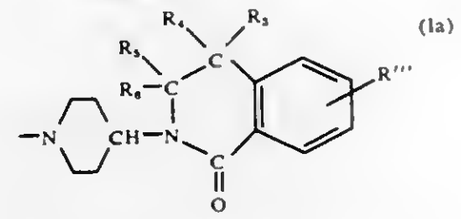
Kurt Eichenberger, Therwil; Christian Egli, Magden; Hans Kuhnis, Basel, and Oswald Schier, Oberwil, all of Switzerland, assignors to Ciba-Geigy Corporation, Ardsley, N.Y.

Filed July 14, 1975, Ser. No. 595,456
Claims priority, application Switzerland, July 31, 1974, 10583/74
Int. Cl.² A61K *31/47*; C07D *217/00*
U.S. Cl. 424—258 9 Claims

1. A 1-(3-aryloxy-2-hydroxy- or 2-alkanoyloxy-propyl)-4-(1-oxoisoquinolino)-piperidine compound corresponding to formula



-continued



(Ia)

wherein R′ and R″ are hydrogen, lower o-alkyl, lower o-alkenyl, lower o-alkoxy, lower o-alkenyloxy or an o-halogen atom and R′ and R″ together with the phenyl radical form a β-naphthyl radical, R_2′ denotes hydrogen or lower alkanoyl, R_3 denotes hydrogen, R_4, R_5 and R_6 denote hydrogen, R‴ denotes hydrogen, lower alkyl, lower alkoxy, halogen, or trifluoromethyl, or a therapeutically useful acid addition salt thereof, wherein said open chain groups have up to 4 carbon atoms.

9. An antihypertensive pharmaceutical composition comprising a therapeutically effective amount of a compound claimed in claim 1, together with a pharmaceutical excipient.

4,029,796

NOVEL N-CYCLOALKYLMETHYL DECAHYDROISOQUINOLINES FOR PRODUCING OPIATE-LIKE ANALGESIA

Dennis M. Zimmerman, Indianapolis, and Winston S. Marshall, Bargersville, both of Ind., assignors to Eli Lilly and Company, Indianapolis, Ind.

Division of Ser. No. 477,222, June 7, 1974, Pat. No. 4,001,248. This application Sept. 13, 1976, Ser. No. 722,940

Int. Cl.² A61K *31/47*

U.S. Cl. 424—258 **1 Claim**

1. The process of producing opiate-like analgesia in mammals which comprises administering to a mammal an analgesically-effective amount of a compound selected from the group consisting of trans-dl-1-cyclopropylmethyl-3a-(m-hydroxyphenyl)-1,2,3,3a,4,5,6,7,7a,8-decahydroisoquinoline, trans-l(−)-1-cyclopropylmethyl-3a-(m-hydroxyphenyl)-1,2,3,3a,4,5,6,7,7a,8-decahydroisoquinoline and a pharmaceutically-acceptable acid addition salt thereof.

4,029,797

PROCESS OF MAKING COUGH SYRUP WITH MASKED NOSCAPINE

Virgil D. Blanculli, Fort Lauderdale, Fla., assignor to Fisons Corporation, Bedford, Mass.

Filed June 20, 1973, Ser. No. 371,757

Int. Cl.² A61K *31/485*

U.S. Cl. 424—260 **6 Claims**

1. A method of preparing a palatable-tasting cough syrup formulation containing noscapine, which method comprises:

a. preparing an aqueous liquid syrup-type carrier solution for the noscapine, which carrier includes a buffer to maintain the pH of the liquid carrier above a pH of 7 at all times; and

b. mixing alkaloid noscapine in the absence of noscapine in salt form with the liquid carrier to form a fine suspension of the alkaloid noscapine therein, thereby providing a palatable-tasting liquid formulation of suspended noscapine essentially free of any bitter-tasting noscapine salts.

4,029,798

ANALGETIC COMPOSITION

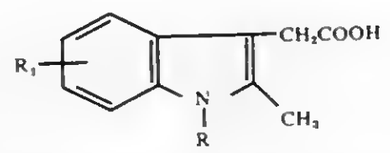
Hisao Yamamoto, Kobe; Toshiya Inukai, Sanda, and Yoshihiko Koga, Minoo, all of Japan, assignors to Sumitomo Chemical Company, Limited, Osaka, Japan

Filed June 2, 1975, Ser. No. 582,757

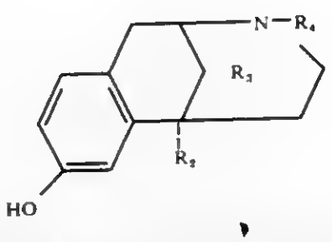
Int. Cl.² A61K *31/485, 31/40*

U.S. Cl. 424—260 **28 Claims**

1. An analgetic composition which comprises, as an active ingredient, a therapeutically effective amount of a synergistic mixture of an indole-3-acetic acid derivative of the formula,



wherein R is a halobenzoyl, piperonyloyl, or cinnamoyl group and R_1 is a 5-methoxy or 5,6-methylenedioxy group; and an analgetic compound of the formula,



wherein R_2 and R_3 are each a C_1-C_3 alkyl group and R_4 is a 4-(4-fluorophenyl)-4-oxobutyl, cyclopropylmethyl or 3-methyl-2-butenyl group and a pharmaceutically acceptable carrier or diluent, wherein the weight ratio of said indole-3-acetic acid derivative and said analgetic compound is from 3:97 to 90:10.

4,029,799

CERTAIN ANALGESICALLY ACTIVE SUBSTITUTED BENZYL PYRIDINE COMPOUNDS

Juan Bosch Cärtes; Jorge Canals Cabirö; Ricardo Granados Jarque, all of Barcelona; Cristobal Martinez Roldän, and Fernando Rabadan Peinado, both of Madrid, all of Spain, assignors to Laboratorios Made, S.A., Spain

Filed Apr. 29, 1975, Ser. No. 572,864

Claims priority, application Spain, Feb. 20, 1975, 434904

Int. Cl.² C07D *213/30;* **A61K** *31/44*

U.S. Cl. 424—263 **3 Claims**

1. A compound selected from the group consisting of 2-(3,4,5-trimethoxybenzyl)-3,4-dimethylpyridine, 3,4,5-trimethoxyphenyl-(3,4-dimethyl-2-pyridyl)-ethoxymethane and pharmaceutically acceptable acid addition salts thereof.

4,029,800

NEUROMUSCULAR BLOCKING AGENTS AND ANTAGONISTS

Theodore S. T. Wang, Lexington, Mass., and Julius A. Vida, DeWitt, N.Y., assignors to Bristol-Myers Company, New York, N.Y.

Filed May 28, 1976, Ser. No. 691,154

Int. Cl.² A61K *31/44, 31/445*

U.S. Cl. 424—263 **6 Claims**

1. A process for causing neuromuscular blockage or for antagonizing the effects of a neuromuscular blocking agent which comprises parenterally administering to a host animal a compound selected from the group consisting of 2-(4′-pyridyl)-1,3-dioxolane methiodide and 2-(1′-methyl-4-piperidyl)-1,3-dioxolane hydroiodide.

4,029,801

PHARMACEUTICAL COMPOSITIONS AND METHODS OF TREATING HYPERTENSION

John Frederick Cavalla, Isleworth, and John Leheup Archibald, Windsor, both of England, assignors to John Wyeth & Brother Limited, Maidenhead, England

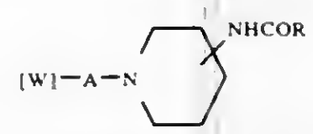
Continuation-in-part of Ser. No. 323,684, Jan. 15, 1973, abandoned, which is a continuation-in-part of Ser. No. 175,345, Aug. 26, 1971, abandoned. This application Apr. 2, 1975, Ser. No. 564,508

Claims priority, application United Kingdom, Sept. 3, 1970, 42090/70; July 22, 1971, 34376/71

Int. Cl.² A61K *31/445*

U.S. Cl. 424—267 **16 Claims**

1. A pharmaceutical composition for use in the treatment of hypertension comprising dosage form of a non-toxic pharmaceutically acceptable solid carrier and an effective amount of a heterocyclic compound of general formula (Ia),



wherein W is phenyl, mono-halophenyl, dihalophenyl, (lower-)alkoxyphenyl, di(lower)alkoxyphenyl, tri(lower)alkoxyphenyl, (lower)alkylphenyl, di-(lower)alkylphenyl, hydroxyphenyl, dihydroxyphenyl, methylenedioxyphenyl, ethylenedioxyphenyl, lower alkanoylaminophenyl, nitrophenyl, aminophenyl, di-(loweralkyl)-aminophenyl or acetylaminohydroxyphenyl; A is alkylene of 1–6 carbon atoms; and R is phenyl, or a pharmaceutically acceptable acid addition salt thereof, said unit dosage being in the form of a powder, capsule or tablet.

4,029,802

THE TREATMENT OF ASTHMA, HAY FEVER OR URTICARIA

Joachim Augstein, Linford; Hugh Cairns, Loughborough; Dennis Hunter, Loughborough, and John King, Loughborough, all of England, assignors to Fisons Limited, England

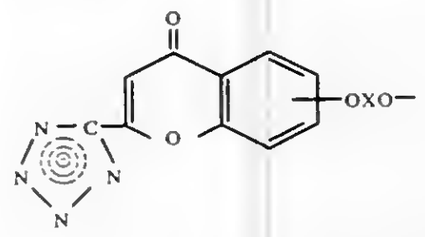
Divisinn of Ser. No. 175,391, Aug. 26, 1971, abandoned. This application Apr. 22, 1974, Ser. No. 463,180

Claims priority, application United Kingdom, Aug. 27, 1970, 41225/70; July 1, 1971, 30828/71

Int. Cl.² A61K *31/41*

U.S. Cl. 424—269 **7 Claims**

1. A method of treatment of asthma, hay fever or urticaria, which comprises administering a theraputically effective amount for the treatment of asthma, hay fever or urticaria, of a compound selected from a compound of formula I,



I

wherein X represent a hydrocarbon chain containing from 3 to 7 carbon atoms which chain may be substituted by one or more hydroxy groups or chlorine atoms,

and a pharmaceutically acceptable salt thereof.

to a patient afflicted with asthma, hay fever or urticaria.

4,029,803

METHOD OF TREATMENT WITH 2-IMINOTHIAZOLIDINES AND THIAZOLINES

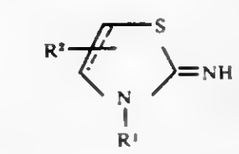
Norman R. Hunter, St. Norbert; Clarence S. Rooney, Beaconsfield; Joshua Rokach, Laval, all of Canada, and Edward J. Cragoe, Jr., Lansdale, Pa., assignors to Merck & Co., Inc., Rahway, N.J.

Filed May 3, 1976, Ser. No. 682,802

Int. Cl.² A61K *31/425*

U.S. Cl. 424—270 **4 Claims**

1. A method of inhibiting indoleamine-N-methyl transferase comprising the administration to a host of a therapeutically effective amount of a compound of formula:



or pharmaceutically acceptable salt thereof, wherein

R^1 is C_{1-2} alkyl, C_3-alkenyl, or C_3-alkynyl; and

R^2 is hydrogen, C_{1-3} alkyl or trifluoromethyl.

4,029,804

INJECTABLE AMOXYCILLIN COMPOSITIONS

Dennis Edward Clark, Basking Ridge, and Robert Charles Blyth, North Plainfield, both of N.J., assignors to Beecham Group Limited, England

Filed Sept. 22, 1975, Ser. No. 615,239

Claims priority, application United Kingdom, Oct. 10, 1974, 43924/74

Int. Cl.² A61K *31/43*

U.S. Cl. 424—271 **1 Claim**

1. A solution adapted for injection which comprises 5–50% by weight of the sodium salt of amoxycillin dissolved in a sterile mixture of water and one or two water-miscible pharmaceutically acceptable alcoholic compounds selected from the group consisting of ethanol, n-propanol, iso-propanol, diethylene glycol, propylene glycol and glyceraldehyde, the mixed solvent system containing 35–85% v/v of water.

4,029,805

SEMISYNTHETIC PENICILLINS

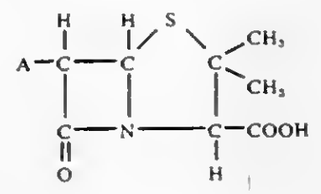
Alexander S. Emodi, West Orange; Harold Leon Newmark, Maplewood, and Leonard Joseph Scialpi, Andover, all of N.J., assignors to Hoffmann-La Roche Inc., Nutley, N.J.

Filed Feb. 13, 1976, Ser. No. 657,810

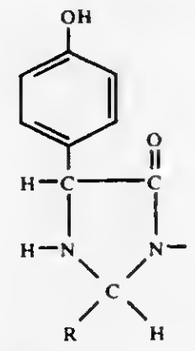
Int. Cl.² A61K *31/43;* **C07D** *499/80*

U.S. Cl. 424—271 **5 Claims**

1. A compound represented by the formula



wherein A is



R is hydrogen, substituted or unsubstituted lower alkenyl or alkyl or 1 to 8 carbon atoms in the alkyl chain, phenyl, and pharmaceutically acceptable salts with bases of said compounds.

4,029,806

NITRO-β-LACTAM ANTIBIOTICS AND PROCESSES FOR THEIR PREPARATION AND USE

Wolfgang Krohn, Leverkusen; Karl Georg Metzger; Michael Preiss, both of Wuppertal, and Michael Walkowiak, Cologne, all of Germany, assignors to Bayer Aktiengesellschaft, Germany

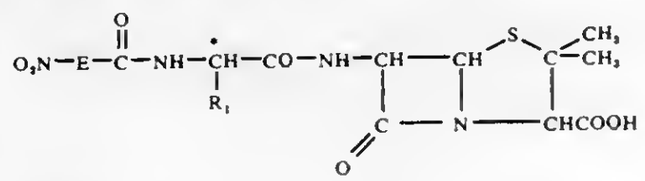
Division of Ser. No. 602,969, Aug. 8, 1975. This application July 22, 1976, Ser. No. 707,854

Claims priority, application Germany, Aug. 22, 1974, 2440268

Int. Cl.² C07D *499/66, 499/68;* **A61K** *31/43*

U.S. Cl. 424—271 **13 Claims**

1. A compound selected from the group consisting of a penicillin of the formula:



wherein

O_2N-E— is nitroalkyl of 1 to 6 carbon atoms;

the carbon atom designated by * constitutes a center of chirality and

R^1 is phenyl, hydroxyphenyl or cyclohexa-1,4-dien-1-yl;

and the pharmaceutically acceptable salts of said penicillin.

4,029,807

COMPOUNDS 5-HYDROXYTRYPTOPHAN GLUTAMATE AND ITS DERIVATIVES

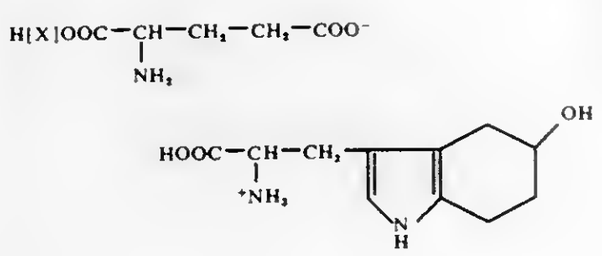
Cristóbal Martinez Roldán; Miguel Fernandez Braña, and José María Castellano Berlanga, all of Madrid, Spain, assignors to Laboratorios Made, S.A., Spain

Filed Apr. 8, 1975, Ser. No. 566,085

Int. Cl.² A01N *9/22*

U.S. Cl. 424—274 **3 Claims**

1. A compound consisting of 5-hydroxytryptophan glutamate having the general formula



---

2. A pharmaceutical composition exhibiting anti-depressive properties which comprises an anti-depressive amount of a compound as claimed in claim 1 and a pharmaceutically acceptable carrier therefor.

4,029,808

THIENYL PHENYL O-(AMINOALKYL)-KETONE OXIME AND FURYL PHENYL O-(AMINOALKYL)-KETONE OXIME CORONARY VASODILATORS

Germaine Thulllier, Paris; Jacqueline Laforest, Vincennes, and Pierre Bessin, Chilly-Mazarin, all of France, assignors to C.E.R.P.H.A. a French Society organised under the laws of France, Arcueil, France

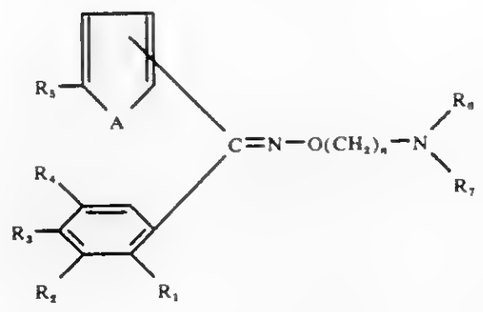
Filed Oct. 15, 1974, Ser. No. 515,063

Claims priority, application France, Oct. 19, 1973, 73.37444

Int. Cl.² A61K *31/34, 31/38*

U.S. Cl. 424—275 **11 Claims**

1. An aromatic compoumd having the formula:



in which,

A in the heterocyclic group is selected from the group consisting of O and S;

R_1, R_2, R_3, and R_4, which may be identical or different, are selected from the group consisting of hydrogen, halogen, lower alkyl, lower alkoxy and lower alkoxylidene;

R_5 is selected from the group consisting of hydrogen, lower alkyl, and nitro;

n is an integer from 1 to 3; and

R_6 and R_7 which are identical or different lower alkyl groups;

and pharmaceutically acceptable acid addition salts of the amino group; said compound being in the form of the cis isomer, the trans isomer or mixtures thereof.

4,029,809

METHOD OF PROTECTING PLANTS FROM PATHOGENS WITH CYANOMETHYL ARYL SULFONATES

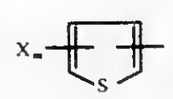
Herbert Q. Smith, deceased, late of Malvern, Pa.; by Jacqueline Smith, legal representative, Yardley, and Sameeh Said Toukan, Phoenixville, both of Pa., assignors to Pennwalt Corporation, Philadelphia, Pa.

Division of Ser. No. 385,495, Aug. 3, 1973, Pat. No. 3,903,298. This application July 25, 1975, Ser. No. 599,280

Int. Cl.² A01N *9/12*

U.S. Cl. 424—275 **2 Claims**

1. A method of inhibiting fungi or bacteria pathogenic to plants which comprises applying to said fungi, bacteria or the locus thereof a biocidally effective amount within the range of about 0.1 pound to about 20 pounds per acre of a cyanomethyl arylsulfonate represented by the formula RSO_3CH_2CN where R is



wherein X is selected from the group consisting of halogen, alkyl having from 1 to 18 carbon atoms, alkoxy having from 1 to 18 carbon atoms, NO_2, CN, CF_3, $CONH_2$, SO_2NH_2, H_2NCOO, COOH, YSO_2 and OOCY, wherein Y is lower alkyl, and *m* is 0 or an integer of 1 to 3.

4,029,810

LACTONE ESTERS OF PHENOXYISOBUTYRIC ACIDS

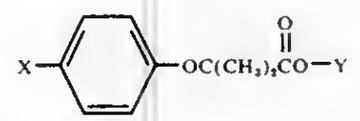
Sumanas Rakhit, Dollard des Ormeaux, Canada, assignor to American Home Products Corporation, New York, N.Y.

Filed Jan. 2, 1976, Ser. No. 646,211

Int. Cl.² C07D *307/32, 307/83*

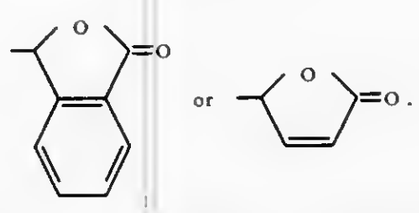
U.S. Cl. 424—279 **6 Claims**

1. A compound of formula I



I.

in which X is chloro, bromo or lower alkyl and Y is



3. A method for lowering concentrations of blood cholesterol and triglycerides in mammals in need thereof which comprises administering to said mammal a blood cholesterol and triglyceride lowering amount of a compound of formula I as claimed in claim 1.

4,029,811

CERTAIN ANTIINFLAMMATORY DIHYDROBENZOFURAN AND DIHYDRONAPHTHOFURAN ACETIC ACID COMPOUNDS

Gian Franco Tamagnone, and Franco De Marchi, both of Turin, Italy, assignors to SCHIAPPARELLI - Stabilimenti Chimici Farmaceutici Riuniti S.p.A., Turin, Italy

Filed June 9, 1975, Ser. No. 585,408

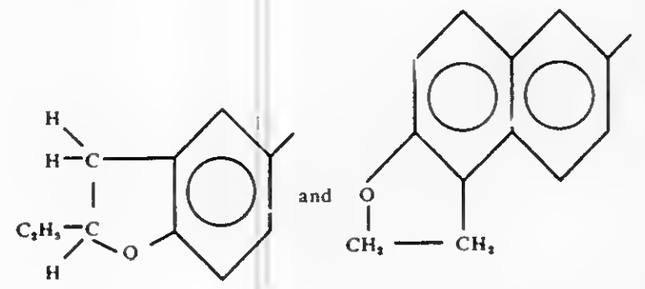
Claims priority, application United Kingdom, June 12, 1974, 26078/74

Int. Cl.² A61K *31/34*

U.S. Cl. 424—285 **7 Claims**

1. A compound of the following structural formula

wherein R represents a group selected from:



where:

X = OH, OCH_3, OC_2H_5; and their water soluble pharmaceutically acceptable salts.

4,029,812

NOVEL HYPOLIPIDEMIC 2-(3,5-DI-TERT-BUTYL-4-HYDROXYPHENYL)THIO CARBOXAMIDES

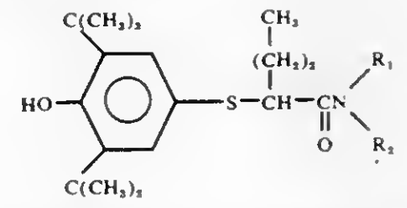
Eugene R. Wagner, Midland, and Larry G. Mueller, Ypsilanti, both of Mich., assignors to The Dow Chemical Company, Midland, Mich.

Filed Feb. 18, 1976, Ser. No. 658,971

Int. Cl.² A61K *31/21, 31/165;* **C07C** *119/20*

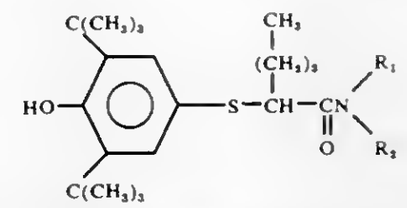
U.S. Cl. 424—298 **7 Claims**

1. A compound of the formula



wherein R_1 represents lower alkoxy and R_2 represents hydrogen, lower alkyl, lower alkoxy, hydroxy or lower hydroxyalkyl.

3. A method for lowering elevated serum lipids in a mammal which comprises administering internally to the mammal a hypolipidemically effective amount of a compound of the formula:



wherein R_1 represents lower alkoxy and R_2 represents hydrogen, lower alkyl, lower alkoxy, hydroxy or lower hydroxyalkyl.

4,029,813

FUNGICIDAL COMPOSITIONS CONTAINING BISTHIOUREIDO-BENZENES AND METHODS FOR USE THEREOF

Teruhisa Noguchi, Tokyo; Keisuke Kohmoto, Tottori, and Kimpei Kato, Ohiso, all of Japan, assignors to Nippon Soda Company Limited, Tokyo, Japan

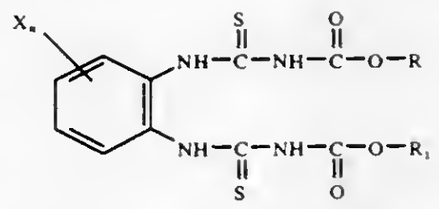
Continuation-in-part of Ser. No. 128,148, March 25, 1971, abandoned, which is a continuation-in-part of Ser. No. 771,269, Oct. 28, 1968, abandoned. This application Nov. 3, 1975, Ser. No. 628,574

Claims priority, application Japan, Oct. 30, 1967, 42-69358; Dec. 27, 1967, 42-83245; Apr. 13, 1968, 43-24528; Apr. 19, 1968, 43-25829; June 18, 1968, 43-41587; June 18, 1968, 43-41589

Int. Cl.² A01N *9/12*

U.S. Cl. 424—300 **16 Claims**

1. A fungicidal composition comprising an inert carrier and a fungicidally effective amount of at least one compound of the formula:



wherein each of R and R_1 represents a member of the group consisting of alkyl containing from 1 to 12 carbon atoms, alkyl containing from 1 to 2 carbon atoms substituted with halogen or methoxy, alkenyl containing 2 to 3 carbon atoms, alkynyl

containing 2 to 3 carbon atoms, benzyl, naphthyl, phenyl and phenyl substituted with halogen or methyl; each X represents halogen, nitro or methyl; *n* represents an integer from 0 to 3.

4,029,814

PHENYL-SUBSTITUTED PROSTAGLANDIN-E TYPE ANALOGS

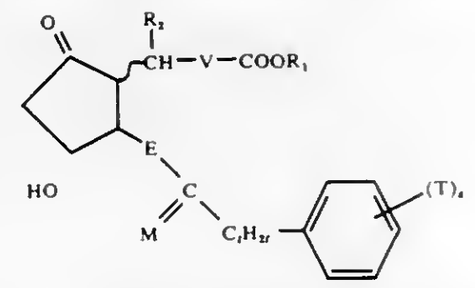
Gordon L. Bundy, Portage, Mich., assignor to The Upjohn Company, Kalamazoo, Mich.

Continuation-in-part of Ser. No. 645,279, Dec. 29, 1975, abandoned, which is a division of Ser. No. 431,011, Jan. 7, 1974, Pat. No. 3,987,087, which is a continuation-in-part of Ser. No. 167,446, July 29, 1971, abandoned, which is a continuation-in-part of Ser. No. 86,303, Nov. 2, 1970, abandoned. This application Sept. 22, 1976, Ser. No. 725,549

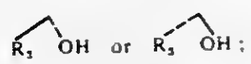
Int. Cl.² C07C *49/28*

U.S. Cl. 424—308 **148 Claims**

1. An optically active compound of the formula:



or a racemic compound of that formula and the mirror image thereof, wherein E is $-CH_2CHR_4-$ or trans $-CH{=}CR_4-$; wherein R_1 is hydrogen, alkyl of one to 8 carbon atoms, inclusive, cycloalkyl of 3 to 10 carbon atoms, inclusive, aralkyl of 7 to 12 carbon atoms, inclusive, phenyl, phenyl substituted with one, 2 or 3 chloro or alkyl of one to 4 carbon atoms, inclusive, or ethyl substituted in the β-position with 3 chloro, wherein M is



wherein R_2, R_3, and R_4 are hydrogen or alkyl of one to 4 carbon atoms, inclusive; wherein C_tH_{2t} represents a valence bond or alkylene of one to 10 carbon atoms, inclusive, substituted with zero, one, or 2 fluoro, with one to 7 carbon atoms, inclusive, between

and the phenyl ring; wherein T is alkyl of one to 4 carbon atoms, inclusive, fluoro, chloro, trifluoromethyl, or $-OR_9$, wherein R_9 is hydrogen or alkyl of one to 4 carbon atoms, inclusive, and s is zero, one, 2, or 3, with the proviso that not more than two T's are other than alkyl; wherein V is (a) alkylene of 3 to 12 carbon atoms, inclusive, substituted with zero, one, 2, 3, or 4 fluoro, with 3 to 7 carbon atoms, inclusive, between $-CHR_2-$ and $COOR_1$, with the proviso that when 3 or 4 fluoro are present, they are all substituents of the carbon atoms alpha and beta to $-COOR_1$, (b) $-CH{=}CH-A-$, cis or trans, or (c) $-C\equiv C-A-$, wherein A is alkylene of one to 10 carbon atoms, inclusive, substituted with zero, one, 2, 3, or 4 fluoro, with one to 5 carbon atoms, inclusive, between $=CH-$ (or $\equiv C-$) and $-COOR_1$, with the proviso that when 3 or 4 fluoro are present, they are all substituents of the carbon atoms alpha and beta to $-COOR_1$, with the further proviso that when E is $-CH_2-CHR_4-$V is (a) above; and wherein ~ indicates attachment of the group to the cyclopentane ring in alpha or beta configuration; including the lower alkanoates thereof, and the pharmacologically acceptable salts thereof when R_1 is hydrogen.

4,029,815

ANTI-DIARRHEAL ANTHRANILIC ACIDS

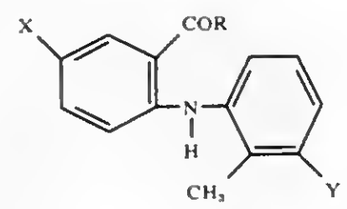
Margaret H. Sherlock, Bloomfield, and James F. Long, Whippany, both of N.J., assignors to Schering Corporation, Kenilworth, N.J.

Filed Apr. 30, 1975, Ser. No. 572,981

Int. Cl.² A61K *31/24*; **C07C** *101/54, 103/28, 103/75*

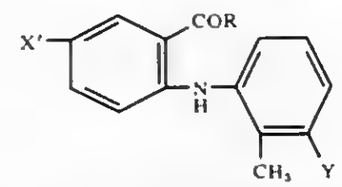
U.S. Cl. 424—309 **14 Claims**

1. The method for the treatment and control of diarrhea which comprises administering to a mammal suffering from diarrhea a therapeutically effective quantity of an N-arylanthranilic acid of the formula:



and the pharmaceutically acceptable salts thereof, wherein Y represents trifluoromethyl, difluoromethyl, or nitro, X represents hydrogen, bromo, chloro or nitro, and R represents OH, -O-lower alkyl, O-$CH_2CHOHCH_2OH$, O-alkyl-NR_1R_2, NHOH or NR_1NR_2, wherein R_1 and R_2 are each hydrogen or lower alkyl.

11. The compounds of the formula:



and the pharmaceutically acceptable salts thereof, wherein X' is H, chloro, bromo or nitro, Y is trifluoromethyl, difluoromethyl, or nitro, and R represents OH,-O-lower alkyl O-$CH_2CHOHCH_2OH$, NHOH, -O-alkyl NR_1R_2, or NR_1NR_2, wherein R_1 and R_2 are each hydrogen or lower alkyl, with the proviso that when X' is hydrogen, Y is difluoromethyl.

4,029,816

SUBSTITUTED 2-AMINOMETHYL-6-IODOPHENOLS

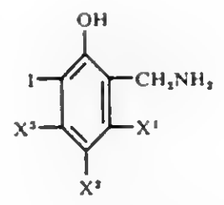
Edward J. Cragoe, Jr., Lansdale, and Everett M. Schultz, Ambler, both of Pa., assignors to Merck & Co., Inc., Rahway, N.J.

Continuation-in-part of Ser. No. 635,198, Nov. 25, 1975, abandoned, which is a continuation of Ser. No. 466,316, May 2, 1974, abandoned, which is a continuation-in-part of Ser. No. 435,558, Jan. 22, 1974, abandoned, which is a continuation of Ser. No. 101,178, Dec. 23, 1970, abandoned. This application Sept. 20, 1976, Ser. No. 724,896

Int. Cl.² A01N *9/20, 9/24*; **C07C** *87/28*

U.S. Cl. 424—316 **14 Claims**

1. A compound of the formula:



wherein

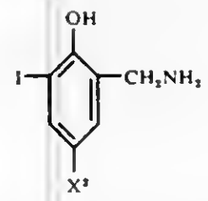
X^1 is hydrogen, methyl or methoxy;

X^2 is lower alkyl containing from 3 to 5 carbon atoms;

X^3 is hydrogen, methyl, ethyl, methoxy or ethoxy

or a non-toxic pharmaceutically acceptable salt thereof.

11. A pharmaceutical composition useful in the treatment of hypertension and edema which comprises from about 10 mg. to 500 mg. of a compound of the formula:



wherein

X^2 is a 4 or 5 carbon atom branched alkyl group wherein the branching occurs on the carbon atom attached to the ring or a non-toxic pharmaceutically acceptable acid addition salt thereof in an inert carrier.

4,029,817

SOFT CONTACT LENS PRESERVING SOLUTIONS

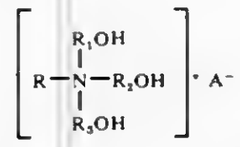
Milagros V. Blanco, Villa Park, and David L. Maurer, Orange, both of Calif., assignors to Allergan Pharmaceuticals, Irvine, Calif.

Continuation-in-part of Ser. No. 399,692, Sept. 24, 1973, abandoned. This application May 22, 1975, Ser. No. 580,034

Int. Cl.² A61K *31/14*

U.S. Cl. 424—329 **6 Claims**

1. A method of sterilizing soft contact lenses comprising contacting a soft contact lens with an effective amount of a sterile, aqueous, non-toxic composition comprising about 0.01 to about 0.1 percent (w/v) of a quaternary ammonium compound having the formula:



wherein A is a non-toxic anion, R is selected from the group consisting of saturated and unsaturated alkyl residues of fatty acids and mixtures thereof having from about 12–18 carbon atoms, R_1, R_2 and R_3 may be the same or different and are alkyl groups having 1–3 carbon atoms, and from about 0.01 to about 2 percent

PROCESS FOR INHIBITING THE DETERIORATION OF WOOD DUE TO MARINE BORING ORGANISMS VIA THE USE OF DIBUTYLBENZYLPHENOL

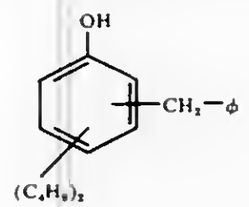
Leonard Jurd, Berkeley, Calif., and John Dale Bultman, Washington, D.C., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Filed Apr. 9, 1976, Ser. No. 675,104

Int. Cl.² A61L *13/00*; **B27K** *3/38*

U.S. Cl. 424—346 **4 Claims**

1. A process for inhibiting deterioration of wood due to marine boring organisms, which comprises applying to the wood a compound of the structure



in an amount sufficient to inhibit deterioration due to marine boring organisms.

4,029,819

SUPEROXIDE DISMUTASE AND ITS APPLICATION AS AN OXIDATION INHIBITOR

Adolf Michael Michelson, Chatenay-Malabry, France, assignor to Etablissement Public det: Agence Nationale de Valorisation de la Recherche Anver, Paris, France

Division of Ser. No. 575,025, May 6, 1975, Pat. No. 3,997,402, which is a continuation-in-part of Ser. No. 461,379, April 16, 1974, abandoned. This application Aug. 22, 1976, Ser. No. 713,670

Claims priority, application France, Apr. 16, 1973, 73.13670

Int. Cl.² A23L *3/34*

U.S. Cl. 426—61 **6 Claims**

1. A composition protected from autooxidation comprising at least one member of the group consisting of lipids and antioxidants for foodstuffs and an effective amount of a superoxide dismutase of extracted from photobacterium marine bacterial cultures characterized by having a molecular weight of about 40,000 ± 2500, a pHi point of about 4 to 7, containing 1 to 2 atoms of non-hematinic iron per mole of superoxide dismutase and having a maximum enzymatic activity at a pH between 8.5 to 10.

3. A composition protected from autooxidation comprising at least one member of the group consisting of lipids and antioxidants for foodstuffs and an effective amount of a superoxide dismutase extracted from photobacterium marine bacterial cultures characterized by a molecular weight of 33,000 ± 2500, a pHi point of about 8.25, having a maximum enzymatic activity at a pH of 8.5 to 10 and containing about 1 atom of copper and about 2.0 atoms of zinc per mole of superoxide dismutase.

4,029,820

TRACERS

Sylvan Eisenberg, San Francisco, Calif., assignor to Micro Tracers, Inc., San Francisco, Calif.

Filed Jan. 20, 1975, Ser. No. 542,357

Int. Cl.² A23K *1/175*

U.S. Cl. 426—74 **6 Claims**

2. A dry pulverulent complete feed composition having as a uniformly distributed ingredient selenium, up to about 0.2 ppm, in the form of sodium selenite or sodium selenate adsorbed to the extent of from about 0.4% to about 4.0% by weight onto finely powdered magnetically attractable iron of from about 40 to about 150 microns in particle size.

4,029,821

ANIMAL FOOD

Douglas Newton Munro, Stathern, England, assignor to Pedigree Petfoods Limited, Melton Mowbray, England

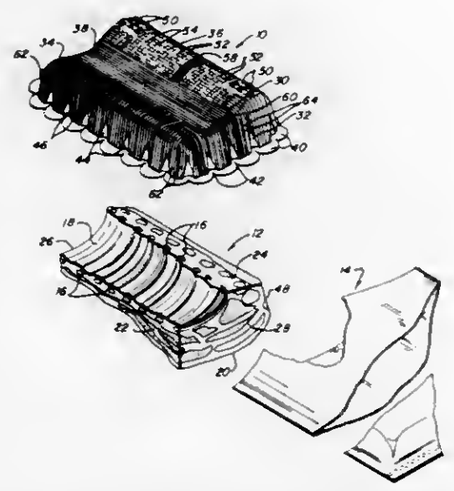
Continuation-in-part of Ser. No. 327,221, Jan. 26, 1973, abandoned. This application Jan. 7, 1976, Ser. No. 647,141

Int. Cl.² A23K *1/00, 1/16*

U.S. Cl. 426—92 **5 Claims**

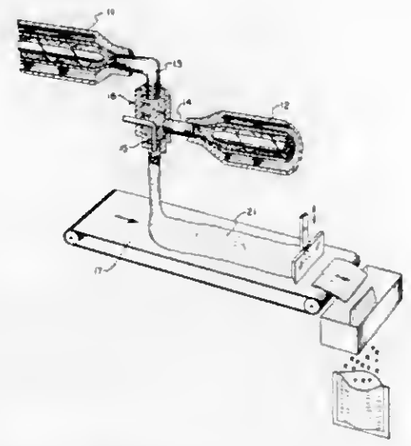
1. As a food composition for animals, discrete bitesized particles comprising a dry coherent food material selected from the group consisting of cereal, fish meal and mixtures thereof, and a coating of condensed fish solubles on said particles providing a concentration of the condensed fish solubles on or near the surface of said particles and constituting from 0.5 –15% of said total food composition.

4,029,822
BONE END SHIELD FOR MEAT CUTS
Robert E. Comer, 2425 25th Ave., Greeley, Colo. 80631
Filed Dec. 29, 1975, Ser. No. 644,628
Int. Cl.² B65B 25/06
U.S. Cl. 426—124 10 Claims



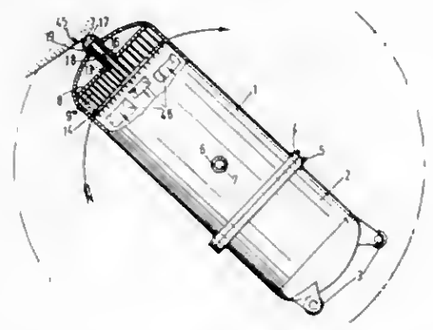
1. In combination: a cut of meat of the type having one or more rows of exposed bone ends and a concave surface adjacent thereto; an air-tight collapsible bag adapted to receive said meat cut and form a vacuum pack therefor upon being evacuated and sealed; and a sheet of pliable heat-formable puncture-resistant and fluid-impervious plastic preformed to provide at least one hump positioned and adapted to overlie a row of said exposed bone ends defining a protective cover therefor, a troughed section alongside said hump for covering said concave surface, and a skirt bordering said hump and troughed section cooperating therewith and with said meat cut to maintain said cut and cover in assembled relation while being placed in the bag and the latter evacuated and sealed.

4,029,823
METHOD OF MAKING A DRY PET FOOD HAVING A MARBLED MEAT-LIKE TEXTURE
David P. Bone, Palatine, and Edward L. Shannon, Barrington, both of Ill., assignors to The Quaker Oats Company, Chicago, Ill.
Filed June 12, 1974, Ser. No. 478,754
Int. Cl.² A23L 1/27
U.S. Cl. 426—249 12 Claims



1. A method for the production of a dry pet food having a moisture content of less than 15 percent by weight and a soft, elastic, marbled, meat-like texture and appearance comprising the steps of forming a first dough containing a first coloring agent and a second dough containing a second coloring agent, each dough comprising a fat, a proteinaceous adhesive, and a plasticizing agent; and sufficient amount of water to produce a product having less than 15 percent by weight moisture and an additional amount of process water; wherein said proteinaceous adhesive is present in an amount of from about 4 to about 60 percent by weight of the dough and said plasticizing agent is present in an amount of from about 2 to about 40 percent by weight of the dough; separately cooking said first and second doughs at a temperature between 160° and 300° F.; combining the first dough with said second dough such that the final product contains from about 70–90 percent by weight of said first dough and from about 10–30 percent by weight of said second dough; and drying the final product sufficiently to reduce the moisture content of the final product to less than 15 percent by weight of the final product.

4,029,824
METHOD OF AND APPARATUS FOR TREATING MEAT, MORE PARTICULARLY HAM MEAT
Christianus Petrus Langen, Cuyk, Netherlands, assignor to H. J. Langen & Sons Ltd., Rexdale, Canada
Filed Apr. 25, 1975, Ser. No. 571,592
Claims priority, application Netherlands, Apr. 26, 1974, 7405711
Int. Cl.² A23B 4/02
U.S. Cl. 426—281 2 Claims

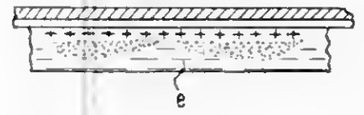


1. In a process of curing meat in a rotary tumbling device having a closed tumbling chamber partly filled with a bath of curing fluid comprising pickling fluid, the steps of repeatedly:
a. massaging the meat by tumbling the meat in and out of said bath within said chamber in response to rotation of said chamber, and thereafter;
b. simultaneously tenderizing and curing the meat by rotating the tumbling device to cause the meat to fall downwardly under the influence of gravity randomly oriented into the bath and onto a plurality of penetrating means located within said chamber and extending upwardly to be penetrated by the said means and thus tenderized, the meat absorbing the curing fluid from the bath and being thus cured, and thereafter;
c. removing said meat from said penetrating means as said tumbling device is rotated, and alternately repeating the cycle of massaging and simultaneous tenderizing and curing while catching and mixing the juices escaping from the meat with said bath.

4,029,825
PRODUCTION OF EGG WHITE SUBSTITUTE FROM WHEY
Pei K. Chang, Montrose, N.Y., assignor to Stauffer Chemical Company, Westport, Conn.
Filed May 30, 1975, Ser. No. 582,550
Int. Cl.² A23C 21/00
U.S. Cl. 426—271 10 Claims

1. A process for forming an egg white substitute which comprises:
a. combining liquid whey with an effective amount of sodium lauryl sulfate to form a whey protein-sodium lauryl sulfate complex which precipitates from solution; and
b. reducing the sodium lauryl sulfate content of the complex to no higher than about 1.0% by weight.

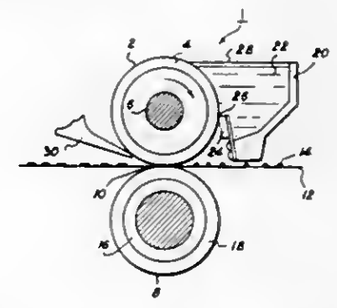
4,029,826
ELECTROSTATIC PRINTING METHOD
Keita Nakano; Kiyoshi Horie, and Noriaki Yamazaki, all of Ebina, Japan, assignors to Fuji Xerox Co., Ltd., Tokyo, Japan
Filed Oct. 2, 1974, Ser. No. 511,278
Claims priority, application Japan, Oct. 9, 1973, 48-112875
Int. Cl.² G03G 13/10
U.S. Cl. 427—16 3 Claims



1. An electrostatic printing method comprising the steps of forming an electrostatic latent image on a recording member;
first developing said electrostatic latent image with a liquid ink comprising an insulating liquid vehicle and at least one solid coloring material, said liquid ink being applied from a developing surface having substantially uniform projections thereon, the spaces between said projections being so filled with said ink that the ink is normally maintained out of contact with the surface of said recording member whereby said liquid ink is electrostatically attracted and applied only to said electrostatic latent image and not to the non-charged background area of said image so that said ink adheres to at least part of said latent image; and
subsequent to said first developing step and prior to the evaporation of said ink, further developing said image by applying to both the developed electrostatic latent image and said non-charged background area an insulating liquid miscible with said insulating liquid vehicle and containing substantially no coloring matter to charge some of the solid coloring material in said ink which adhered to said part of said latent image to a given polarity in said insulating liquid to thereby cause electrophoresis of the charged solid coloring material in the insulating liquid, as a result of which said charged solid coloring material adheres to portions of said latent image left undeveloped by the first developing step to thereby complete the development of said last-mentioned portions.

4,029,827
MERCAPTO FUNCTIONAL POLYORGANOSILOXANE RELEASE AGENTS FOR FUSERS IN ELECTROSTATIC COPIERS
George R. Imperial, Webster, and Donald A. Seanor, Pittsford, both of N.Y., assignors to Xerox Corporation, Stamford, Conn.
Filed July 24, 1974, Ser. No. 491,412
Int. Cl.² B05D 3/12; C23F 7/00; G03G 13/20
U.S. Cl. 427—22 14 Claims

6. The method of fusing modified electroscopic thermoplastic resin toner images to a substrate, said toner having functional groups which react with the metal of a fuser member, including the steps of:
(a) forming a film on a heated, metal fuser member in an electrostatic reproducing apparatus, said film being a barrier to said modified electroscopic thermoplastic resin toner having functional groups and comprising the product resulting from the interaction of the metal fuser member and a polyalkyl siloxane having reactive mercapto-functional groups thereon which interact with the metal fuser member, said mercapto-functional polyalkyl siloxane being fluid at the temperature between about 220° F and 400° F of the metal fuser member and acting as an improved release fluid film for the electroscopic thermoplastic resin toner having functional groups, said film having improved thermal stability;



b. contacting the toner images on said substrate with the coated, heated, metal fuser member for a period of time sufficient to soften the electroscopic thermoplastic resin toner having functional groups; and
(c) allowing the toner to cool.

4,029,828
X-RAY TARGET
Hubert Bildstein; Rudolf Machenschalk, and Helmut Petter, all of Tyrol, Austria, assignors to Schwarzkopf Development Corporation, New York, N.Y.
Filed June 16, 1976, Ser. No. 696,489
Claims priority, application Austria, June 23, 1975, 4809/75
Int. Cl.² B05D 3/06
U.S. Cl. 427—34 10 Claims

1. An X-ray target made of a refractory metal having a high thermal emission coating outside the focal area, the improvement comprising having the target surface outside the focal area equipped with a coating of a mixture consisting of more than 6 and less than 20 weight-% TiO_2 and more than 80 and less than 94 weight-% Al_2O_3.

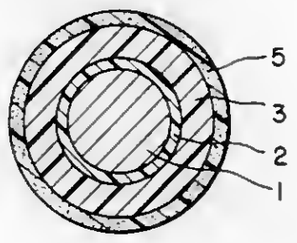
4,029,829
FRICTION MEMBER
John Victor Weaver, Water Orton, and Ronald Fisher, Hillmorton Rugby, both of England, assignors to Dunlop Limited, London, England
Filed Jan. 27, 1975, Ser. No. 544,575
Claims priority, application United Kingdom, Feb. 8, 1974, 05791/74
Int. Cl.² C01B 31/04; C23C 11/10; B32B 5/02
U.S. Cl. 427—44 6 Claims

1. A method of manufacturing an all-carbon friction member which comprises applying to at least one side of a graphite body a layer of carbon fibers with the interposition of a carbonizable resin, curing the resin to bond the layer to the body and subjecting the layer to a chemical vapor deposition process in which the layer is heated in the presence of a hydrocarbon gas whereby carbon is densified on the layer by cracking of the gas and the body is maintained at a higher temperature than the material of the layer during the chemical vapor deposition process whereby carbon is deposited in greatest concentration initially adjacent the hotter body surface and builds therefrom progressively through the fibrous layer to the exposed surface of the layer to form a friction surface on said side of said body.

4,029,830
METHOD OF MANUFACTURING INSULATED ELECTRIC POWER CABLES

Shuji Yamamoto; Setsuya Isshiki, and Mitsuru Igarashi, all of Tokyo, Japan, assignors to The Fujikura Cable Works, Ltd., Tokyo, Japan

Filed May 1, 1975, Ser. No. 573,425
Claims priority, application Japan, July 25, 1974, 49-85418; Aug. 22, 1974, 49-96549; Aug. 22, 1974, 49-96550; Oct. 14, 1974, 49-117942
Int. Cl.² B05D 5/12
U.S. Cl. 427—57 8 Claims



1. A method of manufacturing an insulated electric power cable comprising the steps of applying a curable polyethylene material on an electric conductor to form a polyethylene insulation layer, providing over said insulation layer, a layer of a plastic compound comprising 100 parts by weight of a thermoplastic resin and from 5 to 70 parts by weight of calcium oxide having an average diameter ≤ 50 μm and curing both the insulation layer and said layer of plastic compound at the same time with steam under a pressure of 1.5- 20 kg/cm², said thermoplastic resin being selected from the group consisting of saturated or unsaturated olefin polymers and ethylene-vinyl acetate copolymers with or without vinyl chloride grafting.

4,029,831
METHOD OF MAKING A MULTI-GLOSS PANEL

Lyn A. Daunheimer, Batavia, Ill., assignor to Masonite Corporation, Chicago, Ill.

Continuation-in-part of Ser. No. 588,322, June 19, 1975, abandoned, which is a continuation-in-part of Ser. No. 421,289, Dec. 3, 1973, abandoned. This application June 1, 1976, Ser. No. 691,703
Int. Cl.² B05D 5/02, 3/10
U.S. Cl. 427—264 10 Claims

1. A method of making a panel having a substantially flat planar surface with areas of differing light reflection characteristics, comprising the steps of:

applying to substantially the entire surface of a panel substrate a uniform thickness of a curable resinous top coat material comprising an alkyd resin and a second resin selected from the group consisting of urea-formaldehyde, melamine-formaldehyde and a mixture of urea-formaldehyde and melamine-formaldehyde wherein the ratio of alkyd resin to the second resin is in the weight ratio range of 1:19 to 19:1.

Curing said top coat material over substantially the entire surface thereof; and

inhibiting the curing of said top coat material in portions overlying selected areas of said surface to cause said portions to cure at a lower rate than the remainder of the coating thereby obtaining a cured substantially flat and planar top coat surface which reflects light more diffusely in a desired microscopically roughened pattern corresponding to the inhibited portions of said top coat material.

4,029,832
METHOD FOR PRODUCING AN ADHESIVE-COATED HIGH-STRENGTH STEEL REINFORCING MEMBER

Thomas E. Graham, Raleigh, N.C.; George H. Thaxton, Charleston, S.C.; Francis M. Mitchell, Chapel Hill, and Robert P. Bell, Cary, both of N.C., assignors to Monsanto Company, St. Louis, Mo.

Filed July 3, 1975, Ser. No. 598,591
Int. Cl.² C21D 1/00, 9/52
U.S. Cl. 427—318 17 Claims

1. A method for producing an adhesive-coated, high-strength steel reinforcing member, comprising the steps of:

a. providing a steel member;

b. austenitizing said member;

c. passing said member while in the austenitic state through an organic adhesive coating bath wherein a continuous adhesive coating for rubber is applied at a rate sufficient to form a quenched structure of martensite, bainite or mixtures thereof; and

d. reheating said member to dry and cure said adhesive coating and to temper said steel member.

16. In a method for heat treating a steel wire cord or ribbon and applying a continuous organic adhesive for rubber thereon, the improvement which comprises heating the said cord or ribbon to the austenitic range and passing the said cord or ribbon while in the austenitic range into a dip or bath of the said organic adhesive at a rate sufficient to transform the austenite to martensite, bainite or mixtures thereof.

4,029,833
WEB COATING APPARATUS

Geza Kosta, Plainfield, N.J., assignor to Midland-Ross Corporation, Cleveland, Ohio

Filed Apr. 11, 1975, Ser. No. 567,295
Int. Cl.² B05D 1/28
U.S. Cl. 427—428 6 Claims

1. A method of coating a web comprising the steps of: providing a pond of coating liquid having a viscosity up to 10,000 centipoises in upstream submerging relation with a first nip defining a gap of not less than about 0.0002 of an inch and not greater than about 0.015 of an inch formed between a first metallic roll and a second metallic roll, both rotatable to a surface accuracy within the first nip of less than 0.0001 of an inch;

passing said liquid downstream through said nip by rotating the first roll through said nip in an upstream direction and rotating said second roll through said nip in the downstream direction at a peripheral rate greater than that of said first roll;

passing the liquid carried on said second roll through a second nip formed by said second roll and a third roll having a resilient peripheral surface of a Shore A durometer hardness of approximately 90;

supporting said third roll in pressure nip relation with the second roll and rotating the third roll concurrently with the second roll through said second nip at a peripheral speed greater than that of said second roll by a factor substantially equal to the quotient of the thickness of material entering said second nip divided by the thickness of material leaving said nip;

passing the material carried away from said second nip through a third nip formed between said third roll and a fourth roll having resilient peripheral surface of a Shore A durometer hardness of approximately 90;

guiding a web through said third nip; and

supporting the fourth roll in pressure nip relation with the third roll and rotating the fourth roll concurrently with the third roll through said third nip at the same peripheral speed as said third roll to receive and forward the web at said peripheral speed.

3. Apparatus for coating webs comprising:

a first roll and a second roll oriented in nip relationship to receive and maintain a pond of coating material at the upstream side of the nip therebetween and at a height submerging said nip, both of said rolls being transaxially inflexible and finished to a hard surface of radial uniformity less than 0.0001 of an inch rendering said rolls capable of holding a constant nip gas while passing liquid having an absolute viscosity of up to 10,000 centipoises;

means for supporting said two rolls at a fixed nip gap;

means for driving the first roll through said nip in an upstream direction;

means for driving said second roll through said nip in the downstream direction at a peripheral rate greater than that of said first roll;

a third roll comprising a peripheral resilient material of a Shore A scale durometer hardness of approximately 90 supported in pressure nip relation with the second roll to form a second nip;

means for driving of a third roll concurrently with said second roll through said second nip at a peripheral speed substantially greater than that of the second roll;

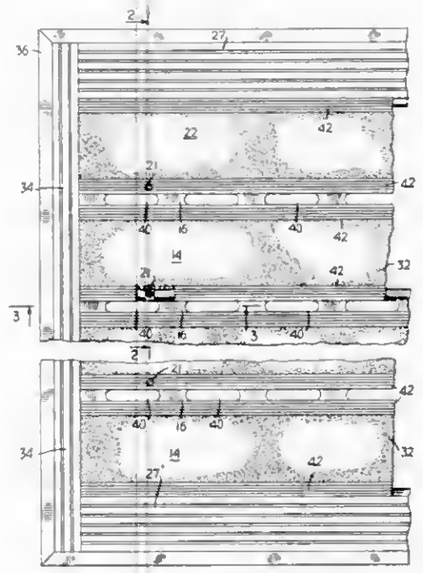
a fourth roll comprising a peripheral resilient material of a Shore A scale durometer hardness of approximately 90 supported in pressure nip relation with said third roll to form a third nip; and

means for driving said fourth roll concurrently with the third roll through said third nip at the same peripheral speed as said third roll, said third and fourth rolls being speedrated and adapted to receive the web and forward it at said peripheral speed through said third nip.

4,029,834
FLOOR MAT WITH HINGED RIGID ELONGATED RAILS

Gary F. Bartlett, Muncy, Pa., assignor to Construction Specialties, Inc., Cranford, N.J.

Filed Dec. 22, 1975, Ser. No. 643,303
Int. Cl.² B32B 3/06, 3/10; F04C 1/30; E04F 15/16
U.S. Cl. 428—62 9 Claims



1. A floor mat comprising a multiplicity of substantially rigid, elongated rails disposed generally parallel to each other in closely spaced relation, each rail having a base portion for support, a top portion, a ball structure extending continuously along one edge and having an enlarged ball end portion of uniform arcuate cross-section, and a socket structure extending continuously along the other edge and having an enlarged socket end portion defining an outwardly open concavity of arcuate cross-section matching the ball portion, the rails being interlocked with each other for fixedly spacing them from each other by reception of a ball portion of one rail within a socket portion of an adjacent rail, and the opening to the concavity being smaller than the ball end portion but larger than the part of the ball structure adjacent the ball end portion and at the opening to permit rotational movement of the rails transversely relative to each other, whereby the floor mat may be rolled up, and a tread surface on the top portion.

4,029,835
HEAT RESISTANT SHEET

Hiroshi Iwata, and Mikio Yoshida, both of Ohtake, Japan, assignors to Mitsubishi Rayon Co., Ltd., Tokyo, Japan

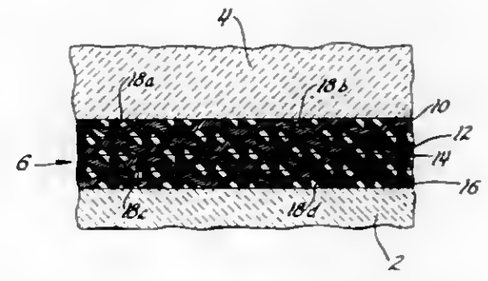
Filed Jan. 14, 1976, Ser. No. 649,147
Claims priority, application Japan, Jan. 16, 1975, 50-7327
Int. Cl.² B32B 7/00
U.S. Cl. 428—212 7 Claims

1. A heat resistant sheet produced by pressing and heating a mixed web of wholly aromatic polyamide fibers [A] having a maximum loss tangent tan δ(max) 0.25 and a sonic modulus Es < 130 g/d and wholly-aromatic polyamide fibers [B] having a maximum loss tangent tan δ(max) 0.2 and a sonic modulus Es < 130 g/d at a temperature of from 200° to 350° C and a pressure of not more than 200 kg/cm² wherein said fibers [A] are heat fused.

4,029,836
RESILIENT HEAT RESISTANT LAMINATED COMPOSITE

Leonard Wieczorek, Golden, Colo., assignor to Coors Porcelain Company, Golden, Colo.

Continuation of Ser. No. 547,302, Feb. 5, 1975, abandoned. This application Sept. 15, 1976, Ser. No. 723,428
Int. Cl.² B32B 7/00
U.S. Cl. 428—246 6 Claims

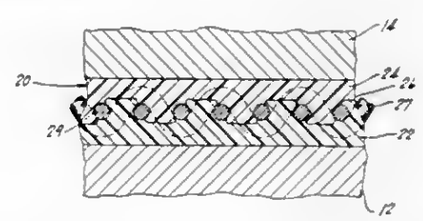


1. An assembly comprising two members, at least one of which is ceramic, bonded together by a layer of resilient heat-resistant laminated composite consisting essentially of a plurality of layers of woven graphite cloth bonded together by silicone rubber, said composite containing from about 60% to 90% by volume of said woven graphite cloth and the remainder of said silicone rubber and having resiliency above the temperature at which the silicone rubber loses its resiliency.

4,029,837
COMPOSITE PLASTIC-METALLIC BONDING MEANS AND METHOD

Alfred F. Leatherman, Columbus, Ohio, assignor to William C. Heller, Jr., Milwaukee, Wis.

Filed Aug. 14, 1975, Ser. No. 604,833
Int. Cl.² B32B 7/00, 15/00
U.S. Cl. 428—247 20 Claims



1. A composite bonding agent suitable for joining first and

second thermally bondable plastic bodies having at least some mutual bonding incompatibility comprising, in a generally stratified, integral configuration:

a first thermoplastic material layer having thermal fusion bonding compatibility with the first body;

a second thermoplastic material layer having thermal fusion bonding compatibility with the second body, said first and second layers having bonding incompatibility with each other; and

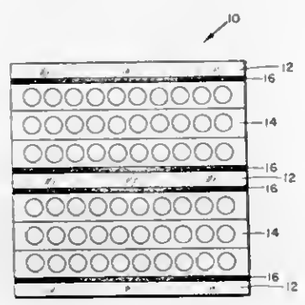
an inductively heatable metallic mesh interposed between said first and second layers, said mesh having a lattice of interwoven wires which mechanically interlock with said layers for providing internal cohesion to the composite bonding agent.

4,029,838

HYBRID COMPOSITE LAMINATE STRUCTURES

Christos C. Chamis, Fairview Park, and Raymond F. Lark, Westlake, both of Ohio, assignors to The United States of America as represented by the Administrator of the National Aeronautics and Space Administration, Washington, D.C.

Filed Sept. 24, 1975, Ser. No. 616,332
Int. Cl.² B32B *5/12, 15/14, 27/38*
U.S. Cl. 428—301 **7 Claims**



1. A hybrid structural laminate comprising alternating plies of a matrix material and planar metallic foil;

said matrix material being embedded with fiber elements having substantially unidirectional strength characteristics, said fiber elements being oriented within said matrix material with the longitudinal axes thereof extending in substantially the same direction; said foil plies alternating within the laminate structure with said matrix material plies, said matrix material being metal for outermost plies and non-metallic for innermost plies; and

said fiber embedded metal matrix material being aluminum with boron fibers therein.

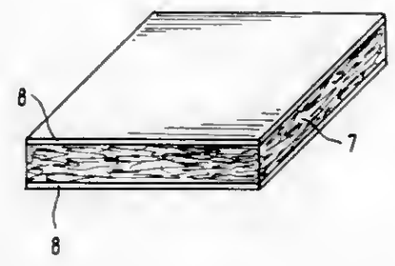
4,029,839

SOUND AND THERMAL INSULATING CONSTRUCTION ELEMENT

Klaus Lesti, Haunstetter Str. 243, Augsburg, Germany

Filed Dec. 3, 1975, Ser. No. 637,467
Claims priority, application Germany, Dec. 6, 1974, 2457848
Int. Cl.² B32B *5/00*
U.S. Cl. 428—306 **10 Claims**

5. A construction element comprising a pressed rigid mass of a hardened binder and comminuted carpet pieces which consists of a rubbery backing and fibers anchored thereto on one side, said pieces being embedded in said binder and held together thereby.



6. The element defined in claim 5 wherein said binder is a synthetic-resin foam.

4,029,840

SYNTHETIC LEATHER

Yasuo Shiklnami, Shiga; Kosuke Iida, Osaka; Kunihiro Hata, Osaka, and Tetsuya Fujii, Osaka, all of Japan, assignors to Takiron Co., Ltd., Osaka, Japan

Filed Oct. 1, 1976, Ser. No. 728,652
Claims priority, application Japan, Jan. 22, 1976, 51-6518
Int. Cl.² B32B *3/26*
U.S. Cl. 428—310 **5 Claims**

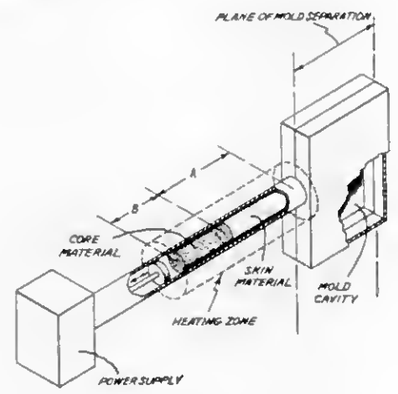
1. Synthetic leather comprising a substrate carrying a resin layer comprising cross-linked, foamed syndiotactic 1,2-polybutadiene.

4,029,841

INJECTION MOLDING PROCESS

Lawrence R. Schmidt, Schenectady, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed Feb. 14, 1975, Ser. No. 550,003
Int. Cl.² B29F *1/12*
U.S. Cl. 428—325 **10 Claims**



1. A process for molding a solid thermoplastic article substantially free of warpage having a skin material essentially free of a nonreinforcing filler and a core material containing a reinforcing filler comprising:

a. positioning at least a first skin material free of a reinforcing amount of a reinforcing filler and at least a first core material containing a reinforcing amount of a reinforcing filler in an elongated heating zone at preselected locations of said materials relative one to the other;

b. heating said materials to a temperature sufficient to melt each of said materials while maintaining said materials at their preselected relative positions;

c. exerting a force free of complex shear fields against an end of the melted materials;

d. linearly moving the melted materials in response to said force through the heating zone and into a mold cavity; and

e. cooling said first skin and said first core materials in the mold cavity.

4,029,842

TRANSPARENT COATED RESIN COMPOSITE

Masaru Yoshida; Hiroshi Okubo, and Isao Kaetsu, all of Takasaki, Japan, assignors to Japan Atomic Energy Research Institute, Tokyo, Japan

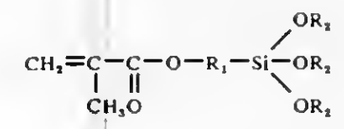
Filed Sept. 2, 1975, Ser. No. 609,857
Claims priority, application Japan, Sept. 5, 1974, 49-101417
Int. Cl.² B29D *11/00;* **G02C** *7/02;* **B32B** *27/08*
U.S. Cl. 428—334 **6 Claims**

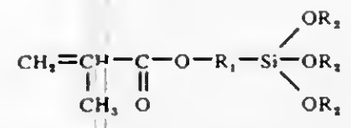
1. A transparent coated resin composite comprising:

a substrate of polymer consisting essentially of methyl methacrylate unit,

b. a precoating formed on said substrate of at least one silicon compound selected from the group consisting of:

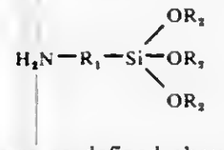
methacryloxyalkyl-trialkoxysilanes represented by the formula





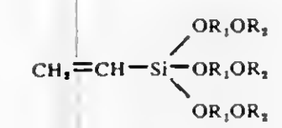
wherein R_1 is an alkylene group having 1 – 6 carbon atoms and R_2 is an alkyl group having 1 – 6 carbon atoms, and hydrolysates thereof;

aminoalkyl-trialkoxysilanes represented by the formula



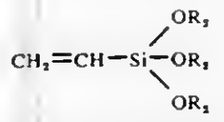
wherein R_1 and R_2 are as defined above, and hydrolysates thereof;

vinyltris(alkoxyalkoxy)silanes represented by the formula



wherein R_1 and R_2 are as defined above, and hydrolysates thereof; and

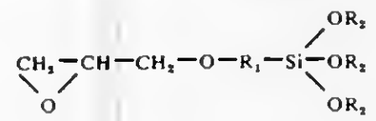
vinyltrialkoxysilanes represented by the formula



wherein R_2 is as defined above, and hydrolysates thereof; and

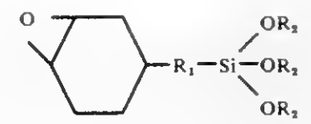
c. an over-coating formed on said precoating of at least one silicon compound selected from the group consisting of:

glycidoxyalkyl-trialkoxysilanes represented by the formula



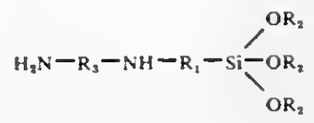
wherein R_1 and R_2 are as defined above, and hydrolysates thereof;

(3,4-epoxycyclohexyl)alkyl-trialkoxysilanes represented by the formula



wherein R_1 and R_2 are as defined above, and hydrolysates thereof;

N-(aminoalkyl)-aminoalkyl-trialkoxysilanes represented by the formula



wherein R_1 and R_2 are as defined above and R_3 is an alkylene group having 1 – 6 carbon atoms, and hydrolysates thereof,

whereby the total thickness of the coating is in the range of 0.0001 – 0.5 mm.

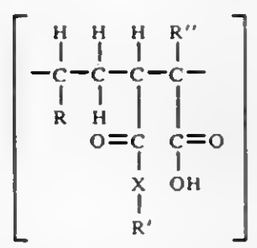
4,029,843

POLYMERIC RELEASE AGENTS

Jaykumar Jivraj Shah, Wheeling; Jules Downes Porsche, Oakbrook, and Charles Bartell, Highland Park, all of Ill., assignors to Borden, Inc., Columbus, Ohio

Filed Jan. 15, 1976, Ser. No. 649,227
Int. Cl.² C09J *7/02*
U.S. Cl. 428—352 **9 Claims**

1. In a tape having a pressure sensitive adhesive on one surface of the base strip of the tape, the improvement consisting of a layer of a polymeric release agent on the opposite surface of said base strip, said polymeric release agent having the following structural formula:



Wherein

R is a straight chain alkyl group with 4 to 22 carbon atoms,

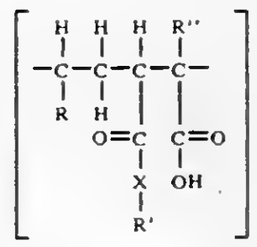
R′ is H or a straight chain alkyl group with 1 to 22 carbon atoms,

R″ is H or CH_3,

X is NH or O,

Either R or R′ must contain at least 12 carbon atoms.

9. A release liner comprising a backing sheet and on at least one surface of said sheet a layer of polymeric release agent, said polymeric release agent having the following structural formula:



Wherein

R is a straight chain alkyl group with 4 to 22 carbon atoms,
R′ is H or a straight chain alkyl group with 1 to 22 carbon atoms;
R″ is H or CH_3,
X is NH or O,
Either R or R′ must contain at least 12 carbon atoms.

4,029,844

ROCKET NOZZLE COMPRISING PYROLYTIC GRAPHITE-SILICON CARBIDE INSERTS

Eugene L. Olcott, Falls Church, Va., assignor to Atlantic Research Corporation, Alexandria, Va.

Division of Ser. Nos. 354,048, April 24, 1973, Pat. No. 3,900,675, and Ser. No. 65,899, Aug. 21, 1970, Pat. No. 3,738,906. This application Feb. 20, 1975, Ser. No. 551,470
The portion of the term of this patent subsequent to Dec. 2, 1992, has been disclaimed.
Int. Cl.² C23C 11/10; C01B 31/36; B05D 7/20; B32B 9/00
U.S. Cl. 428—367 12 Claims

1. A process for making a rocket nozzle insert of pyrolytic graphite microcomposite comprising pyrolytic graphite containing embedded therein codeposited silicon carbide comprising aciculae of silicon carbide, the longitudinal axis of said aciculae being aligned in the c-direction relative to the a–b plane of the associated pyrolytic graphite crystallite at the point of embedment, which comprises pyrolyzing a mixture of methyl trichlorosilane, an inert diluent gas, and a hydrocarbon gas onto a heated cylindrical substrate at a temperature of about 2800° – 3800° F and at a pressure at which said silicon carbide aciculae are formed, the volumetric ratio of inert gas to hydrocarbon gas being at least 86.7 to 13.3 and the weight ratio of methyl trichlorosilane to hydrocarbon being between about 5–95 and 75–25; and shaping the resulting microcomposite cylinder into a rocket nozzle insert.

4,029,845

PRINTED CIRCUIT BASE BOARD AND METHOD FOR MANUFACTURING SAME

Hirotoshi Nomura, Sulta, Japan, assignor to Sumitomo Bakelite Company, Limited, Tokyo and Nomura Electroplating Company, Ltd., Osaka, both of, Japan

Filed Aug. 12, 1975, Ser. No. 603,948
Claims priority, application Japan, Aug. 15, 1974, 49-93940; Aug. 29, 1974, 49-99765; Feb. 5, 1975, 50-15766; Feb. 5, 1975, 50-15767
Int. Cl.² B32B 27/38, 17/04, 27/42, 27/34
U.S. Cl. 428—415 23 Claims

1. A base board, for printed circuits for preparation by the additive process, obtained by heating under pressure (1) a layer of prepreg comprising a thermosetting resin as impregnant, (2) adjacent to said prepreg layer one or two layers of a semi-cured composition comprising 50-300 parts by weight of a thermosetting resin and 100 parts by weight of a nitrile rubber, and (3) adjacent to said composition layer one or two layers of phospholipid, said one or two layers of composition being placed on one or both sides of the layer of prepreg, said one or two layers of phospholiped being applied to the outer side of said layer of composition, to integrate the layers as a finished laminate.

3. A method for manufacturing a base board, for printed circuits for preparation by the additive process, characterized by heating under pressure a layer of prepreg comprising a thermosetting resin as impregnant, and one or two second layers of a transfer sheet material coated with a semi-cured composition of 50–300 parts by weight thermosetting resin and 100 parts by weight nitrile rubber, after undercoating a phospholipid on the transfer sheet material, said one or two layers of composition and phospholipid coated transfer sheet material being placed on one or both sides of the layer of prepreg so as to make contact between the coated side of the sheet material and the prepreg, to integrate the layer of prepreg and the coated sheet material as a finished laminate, and thereafter removing said sheet material, so that a coated composition of sheet material is transferred on the layer of prepreg.

4,029,846

FIBERBOARD SHIMS AND METHOD OF MAKING THEM

John W. Decker, Stockbridge, and Mieczyslaw Talik, Dearborn Hts., both of Mich., assignors to Eagle-Picher Industries, Inc., Cincinnati, Ohio

Filed May 20, 1975, Ser. No. 579,090
Int. Cl.² B32B 27/04, 27/42
U.S. Cl. 428—423 4 Claims

4. In an article of manufacture comprising an automotive assembly shim for use in the assembly of imperfectly fitting automotive components, wherein
said shims are formed of a phenolic resin impregnated cellulosic fiberboard, the improvement wherein
said shims are further impregnated with a solution consisting of up to about 20 percent by volume of methylene-bis-(4-phenyl isocyanate), and cured.

4,029,847

COATING COMPOSITION FOR POLYESTER RESIN CONTAINING CELLULOSIC MATERIAL AND POLYOL-DIISOCYANATE REACTION PRODUCT

Tadao Imagawa, and Noriyuki Endo, both of Fujimiya, Japan, assignors to Fuji Photo Film Co., Ltd., Minami-ashigara, Japan

Division of Ser. No. 501,580, Aug. 29, 1974, Pat. No. 3,984,492. This application Mar. 15, 1976, Ser. No. 667,065
Claims priority, application Japan, Aug. 29, 1973, 48-97051
Int. Cl.² B32B 27/40; C08L 1/12, 1/14, 1/18
U.S. Cl. 428—425 7 Claims

1. A coating composition for a polyester resin which consists essentially of in an organic solvent (1) a cellulosic high molecular weight material and (2) an addition reaction product of at least one polyol having at least two hydroxyl groups and having 2 to 10 carbon atoms, and at least one diisocyanate having the general formula OCN —R —NCO, wherein R represents a divalent aliphatic or aromatic hydrocarbon group in an equivalent ratio of about 1:0.5 to 1:2 of the diisocyanate per hydroxyl group of the polyol, and wherein the ratio of component (2) to component (1) is about 10% to 500% by weight.

5. A polyester coated article comprising a polyester resin film having thereon a layer of the coating composition of claim 1.

4,029,848

UNSATURATED POLYESTER RESINS CONTAINING A DICYCLOPENTADIENE CONCENTRATE

Donald L. Nelson, Lake Jackson, Tex., assignor to The Dow Chemical Company, Midland, Mich.

Filed Jan. 21, 1976, Ser. No. 651,325
Int. Cl.² B32B 27/36, 17/04, 17/10; C08C 13/41
U.S. Cl. 428—430 6 Claims

1. The unsaturated polyester produced by reacting:
A. a glycol,
B. an olefinically unsaturated dicarboxylic acid or its corresponding anhydride,

C. a saturated dicarboxylic acid or its corresponding anhydride, and
D. an effective amount of a dicyclopentadiene concentrate comprising about 60 to about 90 percent by weight of dicyclopentadiene and about 5 to about 30 percent by weight of the mixed Diels Alder dimers of butadiene, piperylene, isoprene, cyclopentadiene and methyl cyclopentadiene.

3. The unsaturated polyester resin of claim 1 blended with a liquid ethylenically unsaturated monomer.

5. A glass fiber laminate with the blend of claim 3.

4,029,849

COVER SHEETS WITH TIMING LAYER COMPRISING CELLULOSE ACETATE AND COPOLYMER OF MALEIC ANHYDRIDE

Edward P. Abel, Webster, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.

Division of Ser. No. 521,221, Nov. 5, 1974, Pat. No. 4,009,030. This application Sept. 7, 1976, Ser. No. 720,726
Int. Cl.² G03C 7/00, 5/54; B44D 1/09, 1/30
U.S. Cl. 428—500 6 Claims

1. In a cover sheet comprising a transparent support having thereon in order a neutralizing layer and a timing layer, the improvement comprising employing as said timing layer a compatible mixture of cellulose acetate and a maleic anhydride copolymer to provide a clear layer, said mixture comprising about 2 to about 20% by weight of said copolymer.

4,029,850

ADHESIVE COMPRISING POST-CHLORINATED POLYETHYLENE AND POLYVINYL CHLORIDE

Ko Ishii, Takatsuki, and Tadamasa Yoshida, Kobe, both of Japan, assignors to Sumitomo Bakelite Company, Limited, Tokyo, Japan

Division of Ser. No. 428,997, Dec. 27, 1973, abandoned. This application Dec. 22, 1975, Ser. No. 642,934
Claims priority, application Japan, Dec. 27, 1972, 47-129989; Dec. 27, 1972, 47-129990; Dec. 27, 1972, 47-129991; Dec. 27, 1972, 47-129992
Int. Cl.² B32B 27/08, 27/30, 27/32
U.S. Cl. 428—518 5 Claims

1. A composite material of a thermoplastic resin and an olefinic polymer, said thermoplastic resin comprising
a. 2 to 50 parts by weight of post-chlorinated polyethylene having a specific gravity of 1.00 to 1.35, a chlorine content of 5 to 50% and a mean molecular weight of from about 20,000 to 200,000, and
b. 100 parts by weight of polyvinyl chloride having a mean degree of polymerization from about 300 to 2,500, and said thermoplastic resin and said olefinic polymer having a contact interface therebetween.

4,029,851

LUMINESCENT MATERIAL AND X-RAY INTENSIFIER FOIL CONTAINING THE SAME

Heinz Degenhardt, Erlangen, Germany, assignor to Siemens Aktiengesellschaft, Berlin & Munich, Germany

Filed Dec. 17, 1975, Ser. No. 641,573
Claims priority, application Germany, Dec. 23, 1974, 2461260
Int. Cl.² C09K 11/46
U.S. Cl. 428—539 3 Claims

1. A luminescent material excitable by X-rays consisting essentially of terbium activated lanthanum-lead oxybromide crystals, wherein the lead content is in the range of 0.01 to 10 mole percent said mole percent based on the mole content of lanthanum and lead, said luminescent material having the general formula:

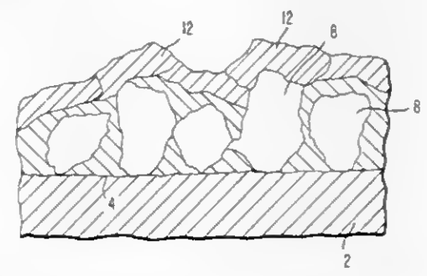
$(La,Pb)OBr:Tb.$

4,029,852

METAL NON-SKID COATING

Maximilian Palena, 1000 Wayne Road, Haddonfield, N.J. 08033

Continuation-in-part of Ser. No. 477,729, June 10, 1974, abandoned, which is a division of Ser. No. 783,901, Dec. 16, 1968, Pat. No. 3,855,444. This application Feb. 6, 1976, Ser. No. 655,939
Int. Cl.² B32B 15/16
U.S. Cl. 428—621 14 Claims



1. A non-skid product having a rough wearing surface comprising a sheet of backing material having a layer of grit particles in direct contact with the surface of the sheet, said particles being bonded to each other and to said sheet by solidified metal and covered by a layer of metal in direct contact with the solidified metal and serving to substantially encapsulate the grit particles, the grit particles having an average particle size exceeding 20 mesh and the thickness of the layers of grit and metal exceeding about 0.06 inch.

4,029,853

PBS-AL SELECTIVE SOLAR ABSORBER

Thomas J. McMahon, and Arold K. Green, both of Ridgecrest, Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed June 20, 1975, Ser. No. 588,914
Int. Cl.² B32B 15/20
U.S. Cl. 428—621 2 Claims

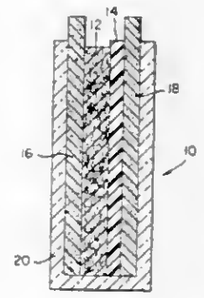
1. As an article of manufacture a solar energy collection panel for solar absorbing purposes comprising:
A. A thermally conductive plate of aluminum; and
B. A vacuum deposited coating of lead sulfide on one exterior surface of said thermally conductive plate, said lead sulfide coating being from 1000 to 1500 A thick.

4,029,854

HALOGEN ELECTRODE

Myles A. Walsh, West Falmouth; Fraser M. Walsh, Arlington, and Dennis N. Crouse, Melrose, all of Mass., assignors to Eco-Control, Inc., Cambridge, Mass.

Continuation-in-part of Ser. No. 644,636, Dec. 29, 1975, abandoned. This application Jan. 27, 1976, Ser. No. 652,780
Int. Cl.² H01M 4/00
U.S. Cl. 429—27 35 Claims



1. An electrode for interacting with electrochemically ac-

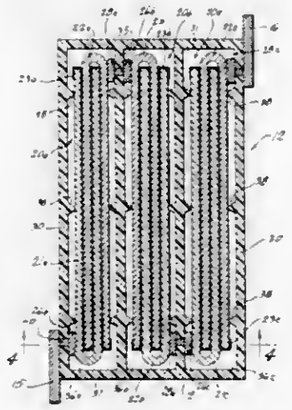
tive halogens in an electrochemical cell, said electrode comprising a conductive matrix and a polymer, said polymer having functional groups selected from the group consisting of quaternary ammonium salts, sulfonium salts, phosphonium salts, and mixtures thereof, said polymer being polymerized in the presence of said conductive matrix to become bonded thereto, said polymer remaining a separate phase from the electrolyte throughout charge and discharge, said polymer having displaceable room for the electrochemically active halogen, said polymer reversibly complexing with the electrochemically active halogen, said polymer not reacting irreversibly with the electro-chemically active halogen, and said polymer being formed from a monomer with a molecular weight in the range of 100–350 amu.

4,029,855

STORAGE BATTERY AND METHOD OF MAKING THE SAME

Thomas John Dougherty, Waukesha, and Victor William Bast, Oconto Falls, both of Wis., assignors to Globe-Union Inc., Milwaukee, Wis.

Filed Dec. 10, 1975, Ser. No. 639,350
Int. Cl.² H01M *2/18, 2/24*
U.S. Cl. 429—82 **7 Claims**



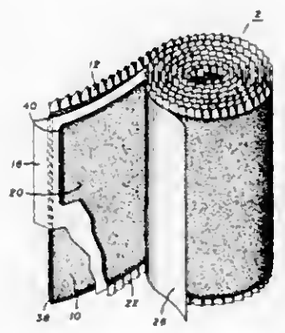
1. A storage battery comprising:
a battery case having a bottom and four side walls, at least one partition dividing the case into two or more cell compartments and a cover;
a battery element disposed within each cell compartment, each element comprising a single fold positive polarity battery plate and a single fold negative polarity battery plate, each of said plates having a vertical median bighted surface at the fold and two integral substantially parallel pasted spaced apart frame members extending from the bight to provide a bifurcated plate configuration with each frame member providing a pair of pasted surfaces, each plate having a conductive lug proximate the bighted surface, said plate frame members being interleaved whereby one of the positive plate frame members extends into the bight of the negative polarity plate toward the negative bighted surface spatially separated from the negative frame members pasted surfaces, and an N-shaped nonconductive separator sheet providing separator surfaces disposed between all adjoining surfaces of said plates;
the conductive lug of each plate being joined to the conductive lug of an opposite polarity plate in the adjoining cell by a connection through the intervening partition, and the unjoined conductive lugs of the end-most cells being coupled to the terminal posts extending outside the battery case; and
means for venting the interior of each cell to the outside of the battery case.

4,029,856

SINTERED POROUS PLAQUE BATTERY PLATES AND METHOD OF MAKING SAME

George Phillip Cromer; Harry Harold Hazen, both of Keystone Heights, and Saverio Pensabene, Gainesville, all of Fla., assignors to General Electric Company, Columbus, Ohio

Filed Apr. 30, 1976, Ser. No. 681,973
Int. Cl.² H01M *6/10*
U.S. Cl. 429—94 **19 Claims**



1. A method for making battery plates comprising the steps of:
a. providing an elongated metal substrate having a width dimensioned to form at least two longitudinal strips of plates from said substrate;
b. forming a first continuous longitudinal strip of a slurry, comprised of a metal powder, said slurry strip being formed with a transversely tapered porous plaque region extending longitudinally of said slurry strip, the longitudinal edges of said slurry strip being defined by said tapered plaque region and a slurry-free region extending longitudinally of said substrate, respectively;
c. sintering said slurry into a rigid porous plaque;
d. severing said substrate longitudinally along said tapered porous plaque region so that said tapered region terminates adjacent the edge of the substrate formed by said severence; and
e. severing said strip transversely into predetermined lengths thereby forming a plurality of plates from said strip.

13. In a battery coil comprising:
a. a pair of partially overlapping spirally wound elongated plates, one of said plates transversely offset from the other of said plates to define a first extended edge of said one plate at one coil end and a second extended edge of said other plate at the other coil end, at least one plate of said pair having a sintered porous plaque on the opposed major surfaces thereof and with active material impregnated therein;
b. a separator sandwiched between said pair of plates; and
c. a current collector fixed to said first extended edge;
d. the improvement comprising a transversely tapered porous plaque region on said major surfaces adjacent and extending longitudinally of the edge opposite said first extended edge of said one plate.

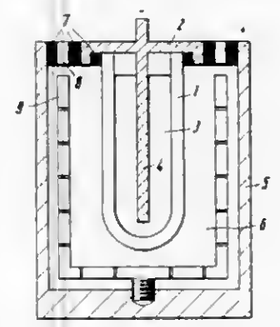
ELECTROCHEMICAL STORAGE CELL OR BATTERY

Wilfried Fischer, Neckargemund; Wilhelm Haar, Sandhausen; Herbert Kleinschmager, Eppelheim, and Gert Weddigen, Kloppenheim, all of Germany, assignors to Brown, Boveri & Cie. A.G., Mannheim, Germany

Filed Dec. 5, 1975, Ser. No. 638,174
Claims priority, application Germany, Dec. 5, 1974, 2457418
Int. Cl.² H01M *4/36*
U.S. Cl. 429—104 **5 Claims**

1. In an electrochemical storage cell or battery based on sodium and sulfur having a chamber containing sulfur material as a reactant and a chamber containing sodium as a reactant separated from each other by a dividing wall capable of conducting sodium ions and with each said electrode chamber having an electrode with an associated current connection, the improvement which comprises disposing an electrode in



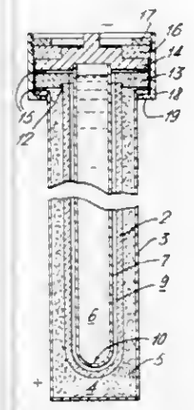
said chamber containing sulfur material, said electrode being spaced from said dividing wall and situated between the dividing wall and the cell wall which defines the outside of said chamber containing sulfur material to electrically screen said cell wall to minimize corrosion of said cell wall.

4,029,858

ELECTRIC CELLS

Leslie Samuel Evans, Reading; Trevor Leslie Markin, Goring-on-Thames; Ronald Michael Dell, Abingdon, and Albert George Montgomery, Reading, all of England, assignors to The Secretary of State for Industry in Her Britannic Majesty's Government of the United Kingdom of Great Britain and Northern Ireland, England

Filed Nov. 17, 1975, Ser. No. 632,783
Claims priority, application United Kingdom, Nov. 19, 1974, 50058/74
Int. Cl.² H01M *4/36*
U.S. Cl. 429—104 **8 Claims**



1. An electric cell having a solid electrolyte which partially bounds on one side thereof a compartment for a liquid cathode and on the opposite side thereof a compartment in the form of a wicking space for a liquid anode, said wicking space being shaped so that said space generally follows the contour of the surface of the solid electrolyte and is capable of containing only a very limited quantity of the liquid anode needed by the cell, and a reservoir for storing the bulk of the liquid anode needed for the cell, wherein the improvement comprises a corrosion resistant barrier between the solid electrolyte and the reservoir and separating one from the other, and a flow limiting means, through which liquid anode in the reservoir must flow to reach the liquid anode compartment and the solid electrolyte, for permitting flow therethrough of liquid anode for the normal charge and discharge operational requirements of the cell but limiting higher rates of flow such that in the event of damage to the solid electrolyte only a very limited quantity of liquid anode is readily available to react with the liquid cathode, and further supply of liquid anode is limited by the flow limiting means.

POLYMERIC MATERIALS WITH ACID END GROUPS

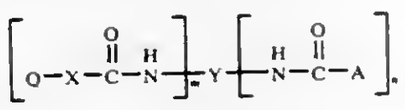
Frank N. Jones, Louisville, Ky., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Continuation-in-part of Ser. No. 329,154, Feb. 2, 1973, abandoned, which is a continuation-in-part of Ser. No. 133,423, April 12, 1971, abandoned, which is a continuation-in-part of Ser. No. 39,523, May 21, 1970, abandoned. This application Oct. 14, 1975, Ser. No. 622,429

Int. Cl.² C08F *20/18*

U.S. Cl. 526—14 **6 Claims**

1. A polymeric material represented by the structure



where

Q is a resinous polymeric or copolymeric segment of

a. an ester of acrylic acid or methacrylic acid with an alkanol of 1–18 carbon atoms;

b. styrene or acrylonitrile;

c. a vinyl ester derived from an acid of 2 through 18 carbon atoms; or

d. a vinyl ether;

X is the residue of a chain transfer agent;

Y is the residue of a di-, tri-, or tetra- isocyanate radical after removal of isocyanate groups;

A is the residue of an acid radical having a pk_a value of −1 to 6; and

m and *n* are 1, 2 or 3, the total not exceeding 4, provided that when *n* is 2 or 3, only one of A need be as defined.

OLEFIN POLYMER CHLORINATION PRODUCTS HAVING IMPROVED HANDLING PROPERTIES AND PROCESS FOR THEIR PREPARATION

Gordon Y. T. Liu, Baton Rouge; Loyd D. Hutchinson, Denham Springs, and S. Douglas Stain, Jr., Baton Rouge, all of La., assignors to The Dow Chemical Company, Midland, Mich.

Continuation-in-part of Ser. No. 590,249, June 25, 1975, abandoned, which is a continuation of Ser. Nu. 373,531, June 25, 1973, abandoned. This application Mar. 15, 1976, Ser. No. 666,844

Int. Cl.² C08F *8/22*

U.S. Cl. 526—43 **2 Claims**

1. In the process of chlorinating solid, linear polyethylene with gaseous chlorine while holding said polyethylene in a fluidized bed state, the improvement consisting of: utilizing a polyethylene characterized by having a flowability measured as angle of repose of from about 24° to about 28°, a bulk density in the range of from about 25 to about 35 pounds/cubic foot and a surface area in the range of from about 2 to about 4 square meters/gram, said polyethylene being composed of individual particles having particle sizes predominantly in the range of from about 300 to about 600 microns and a porosity sufficient to provide an average free volume within individual particles in the range of from about 20 to about 45 volume percent based on total particle volume wherein said polyethylene is fluidized in the presence of an inert fluidizing gas to an extent sufficient to provide a value of no greater than 4 wherein said value is obtained by dividing the height of the powder bed in the reactor by the velocity in feet/second of said fluidizing gas and wherein said polyethylene is chlorinated to an extent of up to about 30 percent by weight chlorine by conducting the chlorination reaction at a temperature not exceeding about 80° C.

4,029,863

METHOD OF OBTAINING SMALL PARTICLE SIZE POLYMERS AND COPOLYMERS OF VINYL CHLORIDE BY BULK POLYMERIZATION

Anthony L. Lemper, Tonawanda, N.Y., assignor to Hooker Chemicals & Plastics Corporation, Niagara Falls, N.Y.

Continuation-in-part of Ser. No. 169,838, Aug. 6, 1971, abandoned. This application July 21, 1975, Ser. No. 597,617

Int. Cl.² C08F *2/02, 14/06*

U.S. Cl. 526—88 **10 Claims**

1. In a process for the preparation of polymers and copolymers of vinyl chloride by bulk homopolymerization or copolymerization of a monomer or monomers wherein said vinyl chloride amounts to at least 80 percent by weight of the monomer employed and wherein polymerization is carried out in a stationary reaction zone in a first stage during which a reaction mixture is subjected to high speed agitation until about 3 percent to about 15 percent of said monomer or monomers have been converted to polymer and in which said polymerization is completed in a second stage during which said reaction mixture is subjected to low speed agitation until the reaction has been completed, the improvement which comprises carrying out said polymerization of said monomer or monomers in said first stage in contact with (1) a combination of a surface active agent which has both hydrophilic and hydrophobic moieties and an additive comprising an organic or inorganic, inert, fine particle size material, solid at least at reaction temperatures, and insoluble in said monomer or monomers (2) said additive alone; wherein said additive has an average particle size of about 0.001 to about 50 microns whereby there is obtained polymer product having an average particle size of 85 microns or under.

4,029,864

CATALYST AND PROCESS FOR THE MANUFACTURE OF POLYETHYLENE

Dieter Kurz, and Erich Männer, both of Burghausen, Germany, assignors to Wacker-Chemie GmbH, Munich, Germany

Filed May 5, 1976, Ser. No. 683,543

Claims priority, application Germany, May 12, 1975, 2521075; Feb. 26, 1976, 2607833; Feb. 26, 1976, 2607832

Int. Cl.² C08F *4/66, 10/02*

U.S. Cl. 526—125 **24 Claims**

1. In the method for the production of an ethylene polymer on a continuous or intermittent basis in either a single stage or multiple stages comprising reacting from 100 to 90 mol percent of ethylene and 0 to 10 mol percent of a alpha-olefin having from 3 to 6 carbon atoms in a hydrocarbon dispersing media having a boiling point between 30° C and 160° C, at a pressure of from 4 to 40 atmospheres gauge and a temperature of from about 60° C to about 100° C, in the presence of a partial pressure of hydrogen of from 0 to 75% of the total pressure, in the presence of a catalytic amount of a solid catalyst substance containing titanium, magnesium and chlorine, and an activating amount of an aluminum activator selected from the group consisting of (a) aluminum alkyls of the formula

$$AlR''_2R'$$

wherein R'' is alkyl having from 1 to 20 carbon atoms and R' is a member selected from the group consisting of hydrogen, R'' and chlorine, and (b) a reaction product of a dialkyl aluminum hydride having from 1 to 20 carbon atoms in each alkyl, with an alkadiene having from 4 to 20 carbon atoms,

and recovering said polyethylene, the improvement consisting essentially of utilizing a solid catalyst substance containing titanium, magnesium and chlorine produced by the steps consisting essentially of (1) reacting metallic magnesium having a large surface area per volume with from 2 to 10 mols of allyl chloride and from 1.75 to 4 mols of a di-lower alkyl ether, per gram-atom of magnesium at a temperature of from about 30° C to about 100° C, (2) maintaining the solid reaction product formed for at least 10 hours at a temperature of between about 30° C to about 140° C in order to age the same, (3) treating said solid reaction product formed, either together with or subsequent to said aging step (2), with from 0.2 to 4 mols of a di-lower alkyl sulfite, per gram-atom of magnesium, (4) reacting the aged and treated solid reaction product with from 0.5 to 10 mols of a titanium compound of the formula

$$Ti\,Cl_x\,(OR)_y$$

wherein *x* is a number from 2 to 4, y is a number from 0 to 2 and the sum of $x + y$ is 4, and R is a member selected from the group consisting of alkyl having 1 to 8 carbon atoms, cycloalkyl having 5 to 8 carbon atoms, chloroalkyl having 2 to 8 carbon atoms, chlorocycloalkyl having 5 to 8 carbon atoms and dichloroalkyl having 3 to 8 carbon atoms, per gram-atom of magnesium, for at least 1 hour at a temperature between about −20° C and about +140° C, and (5) separating said solid catalyst substance containing titanium, magnesium and chlorine.

4,029,865

PROCESS FOR THE POLYMERIZATION OF ETHYLENICALLY UNSATURATED ORGANIC COMPOUNDS

Silvio Vargiu, Casatenovo (Como); Volfango Gualandi, Macherio (Milan), and Beppino Passalenti, Milan, all of Italy, assignors to Societa' Italiana Resine S.I.R. S.p.A., Milan, Italy

Filed Aug. 7, 1975, Ser. No. 602,834

Claims priority, application Italy, Sept. 10, 1974, 27121/74

Int. Cl.² C08F *2/06, 4/40*

U.S. Cl. 526—146 **26 Claims**

1. A method for the solution polymerization by addition of vinylidene chloride monomer or a mixture of the latter with one or more other ethylenically unsaturated monomers, which comprises contacting said monomer or mixture of monomers with a catalytic system consisting of an organic per-compound, an organic compound of zirconium and para-toluene acid sulfonic, in an organic solvent medium in which the monomers, the catalytic system and the polymer or copolymer being formed are soluble.

14. A method for the solution polymerization by addition of vinylidene chloride monomer or a mixture of the latter with one or more other ethylenically unsaturated monomers, which comprises contacting said monomer or mixture of monomers with a catalytic system consisting of an organic per-compound, an organic compound of cobalt and para-toluene sulfonic acid, in an organic solvent medium in which the monomers, the catalytic system and the polymer or copolymer being formed are soluble.

4,029,866

CATIONIC POLYMERIZATION CATALYST

Joseph P. Kennedy, Akron, Ohio, assignor to Exxon Research and Engineering Company, Linden, N.J.

Filed Jan. 28, 1972, Ser. No. 221,774

Int. Cl.² C08F *4/52, 36/06, 36/08*

U.S. Cl. 526—185 **13 Claims**

1. A process for preparing polymers of cationically polymerizable olefins which comprises polymerizing said olefins by (1) introducing into the reaction zone about 10^{-1} to about 10^{-4} mole % based on the moles of olefins to be polymerized of an organoaluminum compound having the general formula AlR_2X wherein X is a halogen or hydrogen and R is the same or different monovalent radical selected from the group consisting of C_1–C_{12} alkyl, phenyl, C_7–C_{14} aralkyl and C_7–C_{14} alkaryl; and (2) subsequently introducing into the reaction zone a cocatalyst selected from the group consisting of halogens, mixed halogens and hypohalides, the molar ratio of said organoaluminum halide to said activator being greater than 1:1.

4,029,867

TERPOLYMERS OF FLUOROALKYL ETHERS AND MALEIC ANHYDRIDE

William L. Wasley, Berkeley, and Allen G. Pittman, El Cerrito, both of Calif., assignors to The United States of America as represented by the Secretary of Agriculture, Washington, D.C.

Division of Ser. No. 322,588, Jan. 10, 1973, Pat. No. 3,844,827, which is a division of Ser. No. 271,894, July 14, 1972, Pat. No. 3,773,728, which is a division of Ser. No. 117,777, Feb. 22, 1971, Pat. No. 3,706,594. This application Mar. 22, 1974, Ser. No. 453,912

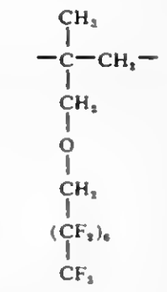
The portion of the term of this patent subsequent to Dec. 19, 1989, has been disclaimed.

Int. Cl.² C08F *214/18*

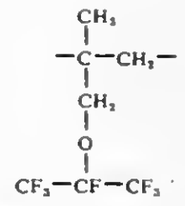
U.S. Cl. 526—247 **1 Claim**

1. A film-forming addition terpolymer which contains -

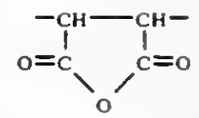
a. recurring units of the structure



b. recurring units of the structure



c. and recurring units of the structure



the aforesaid units being in a molar ratio of 1:1:2.

4,029,868

TETRAFLUOROETHYLENE TERPOLYMERS

Dana Peter Carlson, Parkersburg, W. Va., assignor to E. I. Du Pont de Nemours and Company, Wilmington, Del.

Filed Mar. 10, 1976, Ser. No. 665,548

Int. Cl.² C08F *214/26*

U.S. Cl. 526—247 **3 Claims**

1. A solid, substantially nonelastomeric terpolymer consisting of, in copolymerized form,

a. tetrafluoroethylene,

b. between about 4 and about 12 weight percent hexafluoropropylene, and

c. between about 0.5 and about 3 weight percent of either perfluoro(ethyl vinyl ether) or perfluoro(n-propyl vinyl ether),

said weight percent being based on weight of terpolymer, wherein the terpolymer has a melt viscosity of between about 10^3 and 10^7 poise at 372° C.

4,029,869

METHOD OF MAKING BROADER MOLECULAR WEIGHT DISTRIBUTION POLYSTYRENE

Alvin R. Ingram, and Harold A. Wright, both of Murrysville, Pa., assignors to ARCO Polymers, Inc., Philadelphia, Pa.

Filed Dec. 30, 1975, Ser. No. 645,160

Int. Cl.² C08F *212/08*

U.S. Cl. 526—233 **1 Claim**

1. In a process for polymerizing styrene in aqueous suspension at temperatures of from 80° to 140° C. in the presence of an oil-soluble, free-radical generating initiator, where the suspension is stabilized by the presence of from 0.10 to 5.0 per cent by weight based on styrene of a finely divided, difficultly water-soluble phosphate and an extender for said phosphate, the improvement comprising adding to the polymerizing styrene 0.05 to 0.35 part per 100 parts of styrene of a modifying comonomer selected from the group consisting of allyl acrylate, allyl methacrylate, and allylstyrenes, whereby a broadening of the molcular weight distribution is obtained without forming a polymer insoluble in organic solvents for polystyrene.

4,029,870

TETRAFLUOROETHYLENE POLYMERS

Michael Trevenen Brown, Welwyn Garden City, and William George Rodway, Welwyn, both of England, assignors to Imperial Chemical Industries Limited, London, England

Division of Ser. No. 267,035, June 28, 1972, abandoned, which is a continuation-in-part of Ser. No. 111,700, Feb. 1, 1971, abandoned. This application Mar. 24, 1975, Ser. No. 561,661

Claims priority, application United Kingdom, Feb. 3, 1970, 5037/70; Sept. 17, 1971, 43436/71

Int. Cl.² C08F *2/46, 114/26*

U.S. Cl. 526—255 **3 Claims**

1. An unsintered coagulated dispersion grade of a tetrafluoroethylene polymer selected from (1) tetrafluoroethylene homopolymers and (2) copolymers of tetrafluoroethylene and an ethylenically unsaturated comonomer wherein the comonomer constitutes up to 10% by weight of the copolymer, said polymer having been irradiated with γ-rays and being in the form of a powder which is capable of being comminuted to a number average particle size less than 5 μm as measured optically.

RADICAL POLYMERIZATION OF ETHYLENE IN THE PRESENCE OF CYCLIC OLEFIN

Pierre Glorlod, Lillebonne, and Jean Pierre Machon, Bethune, both of France, assignors to Societe Chimique des Charbonnages-CdF Chimie, Paris, France

Filed Apr. 21, 1976, Ser. No. 678,748

Claims priority, application France, Apr. 22, 1975, 75.12511

Int. Cl.² C08F *2/38, 2/40*

U.S. Cl. 526—308 **5 Claims**

1. In a process for the radical polymerization of ethylene in a stirred autoclave reactor in a reaction medium at temperatures above 220° C and under pressures above 1000 bars in the presence of oxygen, peroxides or peresters as initiators, the improvement comprising injecting into the reaction medium, at the same time as the initiator up to 500 ppm based on the weight of the ethylene of an additive compound selected from the group consisting of cyclic olefins having from 5 to 12 carbon atoms and a ring of 5 to 9 members and styrene and its homologues bearing alkyl substituents on the benzene nucleus.

4,029,876

HEAT-TREATED, CORONA-TREATED POLYMER BODIES AND A PROCESS FOR PRODUCING THEM

Theodore R. Beatty, Bay Village, and Harry Vourlis, Lakewood, both of Ohio, assignors to Union Carbide Corporation, New York, N.Y.

Division of Ser. No. 456,877, April 1, 1974, Pat. No. 3,914,521. This application Apr. 30, 1975, Ser. No. 573,361

Int. Cl.² C08F *10/02, 10/06, 14/06*

U.S. Cl. 526—344 **11 Claims**

1. A process for producing a heat-treated, corona-treated polymer body having a surface with improved adhesion characterisitcs comprising the steps:

a. heating a polymer body to above about 40° C. and below the melting temperature of said polymer body; and

b. cooling the polymer body to ambient temperature and then subjecting said heat-treated and cooled body to a corona discharge at an energy density-to-film surface of at least 9 watt-minute per square foot to improve the affinity of a surface of said polymer body for adhesives.

9. A polymer body made in accordance with the process of claim 1.

4,029,877

PROCESS FOR PREPARING POLYOLEFIN

Hirohisa Yoshiura; Toshiharu Arai; Masao Miyake; Yoshikane Furuya; Seiji Onogi, and Tetsushi Kamizono, all of Kurashiki, Japan, assignors to Mitsubishi Chemical Industries Ltd., Tokyo, Japan

Filed June 10, 1975, Ser. No. 585,600

Claims priority, application Japan, June 13, 1974, 49-67365

Int. Cl.² C08F *6/00*

U.S. Cl. 528—483 **5 Claims**

1. In a process for preparing a polyolefin by polymerizing an olefin in the presence of a Ziegler catalyst having high catalytic activity, in an inert gas sealing system, the improvement which consists essentially of:

separating the polyolefin containing the catalyst residue from the polymerization mixture; and

contacting the polyolefin containing the catalyst residue with a weakly reactive gas of a mixture of an inert gas and a component selected from the group consisting of oxygen, water vapor and mixtures thereof, wherein the concentration of oxygen and water vapor in the inert gas ranges from 0.05 to 0.5 mole percent and 0.05 to 1 mole percent respectively, without separation of catalyst residues from said polyolefin.

4,029,878

PROCESS FOR PREPARING MANNITOL FROM GLUCOSE

Walter M. Kruse, Wilmington, Del., assignor to ICI United States Inc., Wilmington, Del.

Filed May 19, 1975, Ser. No. 578,548

Int. Cl.² C07H *1/00*

U.S. Cl. 536—1 **18 Claims**

1. In a process for producing a solution containing glucose and mannose by contacting an acidic solution of glucose,

oligomers of glucose, or a mixture of glucose and oligomers thereof, with a catalyst containing molybdenum in the hexavalent state at a temperature of at least about 70° C. under non-hydrogenating conditions, the improvement wherein said solution has a carbohydrate content of at least about 50 percent by weight.

4,029,879

PROCESS FOR THE REMOVAL OF CATALYSTS FROM POLYETHER POLYOLS EMPLOYING WATER AND ADSORBENT

John A. Muzzio, Grosse Ile, Mich., assignor to BASF Wyandotte Corporation, Wyandotte, Mich.

Filed Nov. 17, 1975, Ser. No. 632,276
Int. Cl.² C07H *15/08*; **C07C** *41/00, 43/00*
U.S. Cl. 536—4 **7 Claims**

1. In the process for purifying polyoxyalkylene ether polyols containing residual catalyst impurities, said polyols having a molecular weight range of 300 to about 26,000, the improvement which comprises:
   1. providing a mixture of water, said polyol and an adsorbent consisting of synthetic magnesium silicate, wherein the amount of water is from about 1.0 to about 5.0 weight percent based on the weight of the polyol,
   2. heating said mixture at a temperature range from about 80° Centigrade to about 130° Centigrade, and
   3. separating the polyol from the water and the adsorbent by filtration wherein the residual catalyst impurities are retained in the adsorbent.

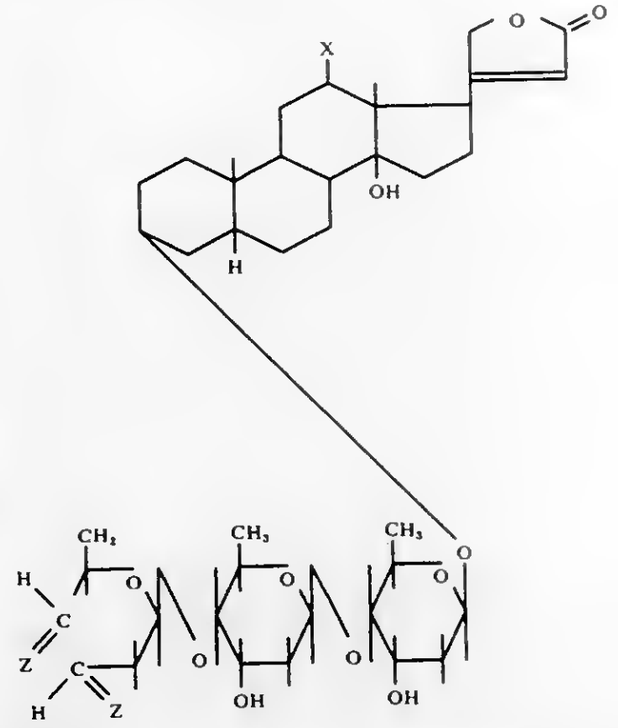
4,029,880

LABELLED DERIVATIVES OF STEROIDS

Keith Charles Tovey, Amersham, England, and John William Addison Findlay, Research Triangle Park, N.C., assignors to The Radiochemical Centre Limited, England

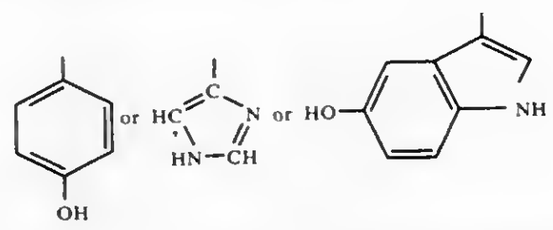
Filed June 19, 1975, Ser. No. 588,165
Claims priority, application United Kingdom, June 20, 1974, 27510/74
Int. Cl.² C07J *17/00*
U.S. Cl. 536—7 **11 Claims**

1. A compound having the structural formula



wherein one or two groups Z are $=NO(CHR)_nCO{\cdot}R_1$, any remaining group Z being = O;

X is —OH or —H;
R is H or C_1 to C_4 alkyl;
n is 1, 2 or 3;
R_1 is either —OH or $-NH{\cdot}CHY{\cdot}(CH_2)_mQ$;
Y is —H or $-COOR_2$;
m is 0, 1, 2, 3, 4 or 5;
R_2 is H, CH_3 or C_2H_5;
Q is unlabelled or labelled and has one of the following structural formulae:



7. A process for making a compound as claimed in claim 1, wherein R_1 is —OH, which process consists essentially of
   a. oxidising digoxin or digitoxin to the dialdehyde;
   b. reacting the dialdehyde with an o-carboxyalkoxyamine having the formula

$NH_2O(CHR)_nCOOH$

where r and n are as defined in claim 1, to form a mono- or di-o-carboxyalkyloxime derivative thereof.

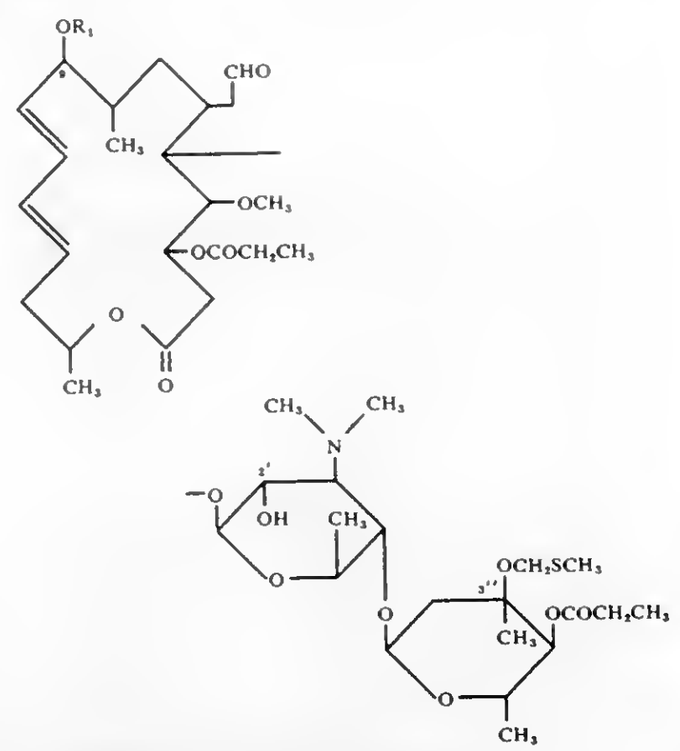
4,029,881

ANTIBIOTIC 9-ACYL-3''-THIOMETHOXYMETHYL-SF-837 COMPOSITION AND PROCESS FOR PREPARING THE SAME

Shigeharu Inouye, Yokohama; Shoji Omoto, Tokyo; Taro Niida, Yokohama, and Bunzo Nomiya, Tokyo, all of Japan, assignors to Meiji Seika Co., Ltd., Japan

Filed Mar. 28, 1973, Ser. No. 345,752
Claims priority, application Japan, Apr. 6, 1972, 47-33897
Int. Cl.² C07H *17/08*
U.S. Cl. 536—9 **9 Claims**

1. 9-acyl-3''-thiomethoxymethyl-SF-837 having the formula:



wherein R_1 represents acetyl or propionyl.

4,029,882

SELECTIVE ACYLATION OF THE C-1 AMINO GROUP OF AMINOGLYCOSIDE ANTIBIOTICS

John J. Wright, Orange, N.J., assignor to Schering Corporation, Kenilworth, N.J.

Filed Mar. 19, 1974, Ser. No. 452,586
Int. Cl.² C07H *15/22*
U.S. Cl. 536—17 **18 Claims**

7. A 1-N-Z-4,6-di-(aminoglycosyl)aminocyclitol antibacterial agent selected from the group consisting of 1-N-Z-gentamicin A, 1-N-Z-gentamicin B, 1-N-Z-gentamicin B_1, 1-N-Z-gentamicin C_1, 1-N-Z-gentamicin C_{1a}, 1-N-Z-gentamicin C_2, 1-N-Z-gentamicin C_{2a}, 1-N-Z-gentamicin X, 1-N-Z-3',4'-dideoxykanamycin B, 1-N-Z-sisomicin, 1-N-Z-verdamicin, 1-N-Z-tobramycin, 1-N-Z-antibiotic G-418, 1-N-Zantibiotic 66-40B, 1-N-Z-antibiotic JI-20A, 1-N-Z-antibiotic JI-20B, 1-N-Z-antibiotic G-52, 1-N-Z-mutamicin 1, 1-N-Z-mutamicin 2, 1-N-Z-mutamicin 4, 1-N-Z-mutamicin 5, 1-N-Z-mutamicin 6, and the non-toxic acid addition salts thereof wherein Z is an acyl group derived from a hydrocarbon carboxylic acid having 1 to 5 carbon atoms, said acyl group being unsubstituted or mono substituted by either hydroxy or amino, said acyl group being straight chain, branched chain or cyclic, said acyl group also being saturated or unsaturated with the proviso that when Z is formyl or is unsaturated it must also be unsubstituted.

4,029,883

DEHYDROXYLATION OF AMINOSUGARS

Kentaro Hiraga, Kyoto; Tetsuya Okutani, Osaka; Kouichi Yoshioka, and Tsunehiko Asako, both of Kyoto, all of Japan, assignors to Takeda Chemical Industries, Ltd., Osaka, Japan

Filed Dec. 20, 1973, Ser. No. 426,693
Claims priority, application Japan, Dec. 29, 1972, 48-2166; Dec. 29, 1972, 48-2167; May 24, 1973, 48-58282; May 24, 1973, 48-58283; July 9, 1973, 48-77261
Int. Cl.² C07H *17/00*
U.S. Cl. 536—17 **12 Claims**

1. A halogenated aminoglycoside antibiotic selected from the group consisting of 3'-chloro-3'-deoxyxylostasin, 3'-chloro-3'-deoxyneomycin B, 3'-chloro-3'-deoxyneomycin A, 3'-chloro-3'-deoxykanamycin B, 3'-chloro-3'-deoxyparomomycin and 3'-chloro-3'-deoxyribostamycin.

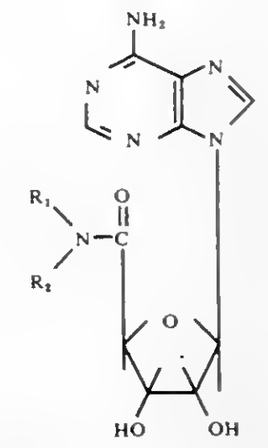
4,029,884

ADENOSINE-5'-CARBOXYLIC ACID AMIDES

Herman Hal Stein, Skokie, Ill., and Raj Nandan Prasad, Pierrefonds, Canada, assignors to Abbott Laboratories, North Chicago, Ill.

Continuation-in-part of Ser. No. 125,893, March 18, 1971. This application Mar. 22, 1972, Ser. No. 236,980
Int. Cl.² C07H *19/18*
U.S. Cl. 536—26 **17 Claims**

1. A compound of the formula



wherein R_1 is hydrogen and R_2 is phenyl, loweralkylphenyl, substituted phenyl, adamantyl, 2-methylfufuryl, benzylamino or R_1 and R_2 taken together form a 5 or 6 membered heterocyclic moiety.

4,029,885

CATIONIC STARCH SIZING

Peter D. Bulkema, Oak Park, Ill., assignor to Nalco Chemical Company, Oak Brook, Ill.

Filed Dec. 31, 1975, Ser. No. 645,778
Int. Cl.² C08B *31/08*
U.S. Cl. 536—50 **10 Claims**

1. A method of making gelatinized cationic starch useful in sizing and coating cellulosic materials which comprises the steps of:
   A. gelatinizing a granular anionic starch;
   B. adding to said starch during the course of gelatinization 1–10% by weight of a condensate of generally equimolar quantities of epichlorohydrin and dimethylamine wherein the percentage of said condensate is calculated from granular anionic starch;
   C. completing said gelatinization; and then,
   D. recovering the gelatinized cationic starch.

4,029,886

PROCESS FOR WATER-INSOLUBILIZATION OF MOLDED PULLULAN

Seizo Nakashio, Nishinomiya; Kozo Tsuji; Nobuhiro Toyota, both of Ibaragi, and Fumio Fujita, Osaka, all of Japan, assignors to Sumitomo Chemical Company, Limited, Osaka and Hayashibara Biochemical Laboratories, Incorporated, both of, Japan

Filed Feb. 27, 1975, Ser. No. 553,678
Claims priority, application Japan, Mar. 1, 1974, 49-24389
Int. Cl.² C07H *15/04*
U.S. Cl. 536—120 **10 Claims**

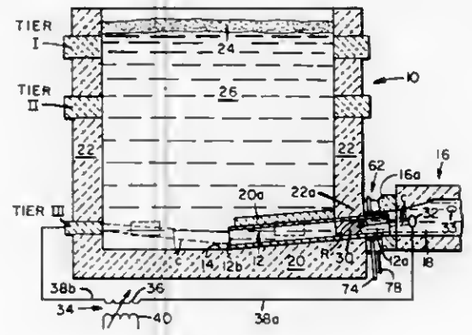
1. A process for the water-insolubilization of a molded pullulan, wherein molded pullan is treated with, at least one combination of a crosslinking agent with a catalyst, said combinations being selected from the group consisting of (1) formaldehyde with zinc chloride, (2) glyoxal with magnesium chloride, and (3) gaseous formaldehyde or glyoxal with hydrogen chloride gas or sulfurous acid ga

4,029,887

ELECTRICALLY HEATED OUTLET SYSTEM

Paul F. Spremulli, Corning, N.Y., assignor to Corning Glass Works, Corning, N.Y.

Filed Apr. 27, 1976, Ser. No. 680,728
Int. Cl.² C03B 5/02, 5/30
U.S. Cl. 13—6 13 Claims



1. An improved electric furnace for melting and refining glass, including a chamber for containing a bath of molten glass having a bottom wall and an upstanding peripheral wall; electrode means for supplying electrical energy to said bath; and passageway means extending through said sidewall for delivering molten glass from said bath to channel means for receiving glass, wherein the improvement comprises:

said passageway means includes a conduit made from an electrically conductive refractory metal;

said channel means includes electrode means; and

means for selectively supplying voltage across at least one electrode of said furnace electrode means and said electrode means in said channel means to establish a flow of electrical currents from said at least one furnace electrode to said conduit, through said electrically conductive conduit, and to said electrode means of the channel means,

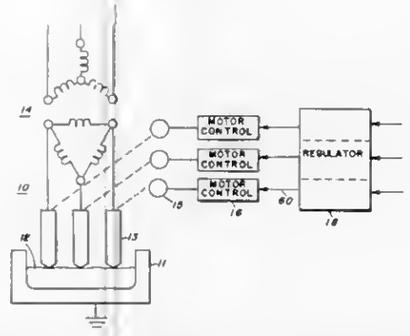
whereby said current flow in said channel means heats the glass therein, and heat transferred therefrom at least partially melts glass-forming materials initially within said conduit.

4,029,888

ARC FURNACE CONTROL SYSTEM

Roland W. Roberts, Pittsburgh, and Michael R. Sochacky, Jr., Murrysville, both of Pa., assignors to Robicon Corporation, Pittsburgh, Pa.

Filed May 27, 1976, Ser. No. 690,581
Int. Cl.² H05B 7/148, 7/152
U.S. Cl. 13—13 12 Claims



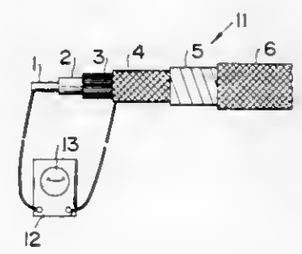
1. A system for controlling the position of an electrode in an electric arc furnace to maintain an arc of desired resistance between the electrode and a charge in the furnace, said system comprising means for deriving a signal representative of the arc current, means for deriving a signal representative of the product of the arc voltage and the power factor of the circuit, and means responsive to said signals for controlling the position of the electrode to maintain said signals substantially equal.

4,029,889

FLUID-LEAK DETECTOR CABLE

Shoken Mizuochi, Niigata, Japan, assignor to Asahi Engineering & Construction Co., Ltd., Tokyo, Japan

Filed Apr. 4, 1975, Ser. No. 565,221
Claims priority, application Japan, Oct. 8, 1974, 49-115944
Int. Cl.² H01B 7/32
U.S. Cl. 174—11 R 12 Claims



1. A fluid-leak detector cable which comprises an inner conductor, an outer conductor, and a serving layer for retaining a leaked fluid disposed therebetween, said layers being coaxially disposed with respect to each other, said outer conductor being provided with an exterior layer of a porous, permeable, plastic film which is permeable to hydrocarbons but not permeable to water, said film having an open-cell structure which is not soluble in the leaking fluid, thereby being adapted to retain the leaking fluid within the serving layer.

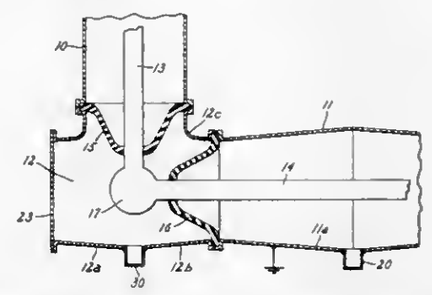
10. A method for detecting a hydrocarbon leak from an underground pipeline which comprises laying a fluid-leak detector cable in close proximity to and substantially parallel to the underground pipeline so that any leaking hydrocarbon fluid may permeate the fluid-leak detector cable, said fluid-leak detector cable comprising an inner conductor and an outer conductor, and a serving layer for retaining the leaked fluid disposed therebetween, said layers being coaxially disposed with respect to each other, said outer conductor being provided with an exterior layer of a porous, permeable, plastic film which is permeable to hydrocarbons, but not permeable to water, said film having an open-cell structure which is not soluble in the leaking fluid, thereby being adapted to retain the leaking fluid within the serving layer.

4,029,890

PARTICLE TRAPPING ELBOW JOINT FOR ENCLOSED HIGH VOLTAGE ELECTRIC BUS APPARATUS

Roy Nakata, Pittsfield, Mass., assignor to General Electric Company, Philadelphia, Pa.

Filed Apr. 19, 1976, Ser. No. 678,091
Int. Cl.² H01B 9/04
U.S. Cl. 174—14 R 3 Claims



1. In an enclosed angular joint between a pair of linear high voltage electric bus conductors disposed in coplanar angular relation and adapted to be disposed with the longitudinal axis of at least one said conductor horizontal, each said conductor being mounted in coaxial radially spaced relation

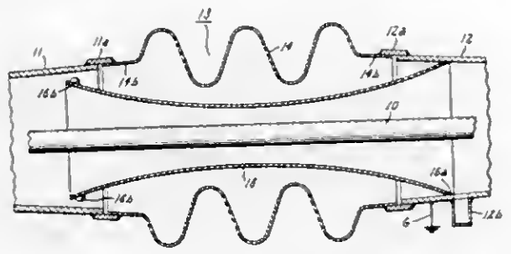
within a tubular sheath of conducting material adapted to be maintained at ground potential, an enlarged connector of generally spherical configuration forming a conductive joint between said linear conductors, a joint housing coupled to both said tubular sheaths and having walls radially spaced from said connector, the bottom wall of said housing including a particle trapping recess substantially centrally positioned in said bottom wall directly beneath said enlarged connector, substantially the entire area of said bottom wall being inclined downwardly toward said recess at an angle to the horizontal of the order of at least 2° to 5°.

4,029,891

PARTICLE TRAPPING SHEATH COUPLING FOR ENCLOSED ELECTRIC BUS APPARATUS

Roy Nakata, Pittsfield, Mass., assignor to General Electric Company, Philadelphia, Pa.

Filed Jan. 22, 1976, Ser. No. 651,666
Int. Cl.² H01B *9/00*
U.S. Cl. 174—14 R **6 Claims**



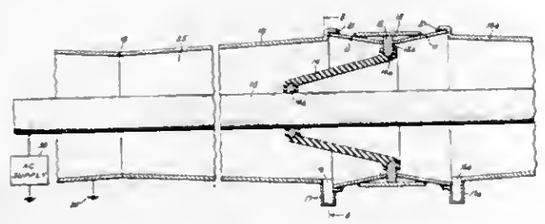
1. In high voltage electric bus apparatus adapted for disposition with its longitudinal axis substantially horizontal, a tubular metallic sheath having an axially corrugated portion including at one end a terminal convolution forming an internal annular recess in said sheath and an adjacent portion axially flared toward said annular recess, said flared adjacent portion having its maximum vertical cross sectional axis proximate said recess and its minimum vertical cross sectional axis remote, and a tapered tubular sleeve of electrically conductive material fixedly mounted within said sheath adjacent the other end of said corrugated portion and extending through said corrugated portion in coaxial radially spaced relation, at least a portion of said sleeve axially flared toward a free end positioned in radially spaced relation, within said adjacent sheath portion, whereby said sleeve electrostatically shields said corrugated portion and said annular recess forms an electrostatic trap for free conductive particles within said sheath, said oppositely flared sleeve and adjacent sheath portion providing stepped and oppositely inclined bottom surfaces adapted to direct electrically levitated particles into said trap.

4,029,892

METHOD AND MEANS FOR TRAPPING PARTICLES IN ENCLOSED HIGH VOLTAGE ELECTRIC BUS APPARATUS

Roy Nakata, Pittsfield, Mass., assignor to General Electric Company, Philadelphia, Pa.

Filed Nov. 28, 1975, Ser. No. 636,254
Int. Cl.² H01B *9/04*
U.S. Cl. 174—14 R **20 Claims**



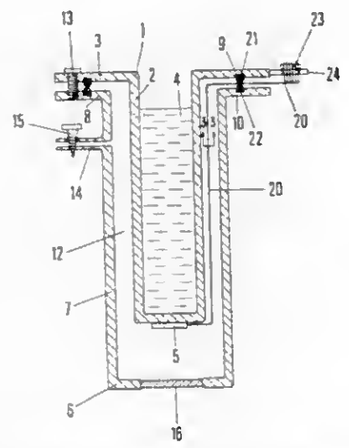
1. Compressed gas insulated high voltage electric bus apparatus adapted for disposition with its longitudinal axis horizontal which comprises, a sectional tubular sheath of electrically conductive material adapted to be maintained at essentially ground potential, said sheath comprising a plurality of tubular sections connected together in hermetically-sealed end-to-end relation and being filled with an insulating gas under pressure, an elongated conductor within said sheath adapted to be maintained at high voltage with respect to ground, a plurality of insulators radially interposed between said conductor and said sheath at axially spaced apart junctures of said sheath sections for maintaining said conductor in substantially coaxial radially-spaced relation within said sheath, insulator supporting means at each such juncture comprising a pair of electrically conductive axially flared collars fixed to said sheath and having insulator mounting means therebetween, each said pair of flared collars being disposed in axially opposed relation with their ends of minimum cross section contiguous and their flared ends remote thereby to provide bottom surfaces inclined downwardly in both axial directions away from said insulator mounting means, and particle trapping receptacles formed in the bottom surface of said sheath immediately adjacent the lowest point of each said downwardly inclined surface.

4,029,893

DOUBLE-WALL CRYOSTAT HAVING ELECTRICAL CONNECTIONS

Michel Robert Roger, Bures sur Yvette, France, assignor to Societe Anonyme de Telecommunications, France

Filed Dec. 4, 1974, Ser. No. 529,388
Claims priority, application France, Dec. 28, 1973, 73.46720
Int. Cl.² H01L *39/00*
U.S. Cl. 174—15 CA **2 Claims**



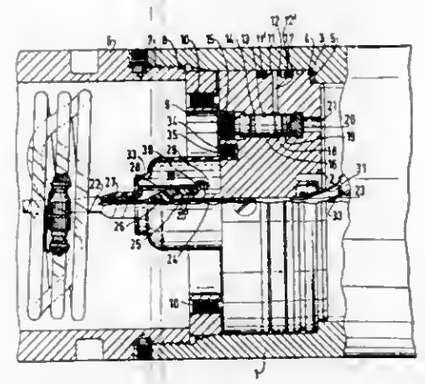
1. In a double-wall cryostat formed by the interconnection of an inner wall and an outer wall in their upper part, the walls defining therebetween a hermetic enclosure in which there is disposed a detector element connected by an electrical connector means to circuits outside said enclosure, the improvement which comprises providing each of the two walls in their upper part with a flexible metallic sealing element, the two metallic sealing elements cooperating by contact for ensuring the hermetic interconnection of the two walls and the electrical connector means comprises a plurality of electrical conductors deposited on a thin band of insulating material and covered with a second thin band of insulating material, said electrical conductor means extending locally out of the hermetic enclosure between said sealing elements, the thinness of the electrical connector means and the ductility of the metallic sealing elements cooperating to enable the cryostat to be hermetically sealed even in the region where said electrical connector means passes through said sealing elements.

4,029,894

SUBMERGED REPEATER HOUSING

Frank L. J. Jarvis, Gravesend; Duncan A. Gunn, Bishops Stortford, and Richard J. Buchanan, Shooters Hill, England, assignors to International Standard Electric Corporation, New York, N.Y.

Filed Aug. 22, 1975, Ser. No. 606,760
Claims priority, application United Kingdom, Oct. 29, 1974, 46742/74
Int. Cl.² H02G *15/14*
U.S. Cl. 174—70 S **3 Claims**



1. A submersible housing for submarine cable repeaters and equalizers comprising

a tubular casing having an internal annular seat;

a bulkhead in said casing adjacent to said seat;

an annular non-resilient seal between said seat and said bulkhead;

a fixed annular clamping ring in said housing in front of said bulkhead; and

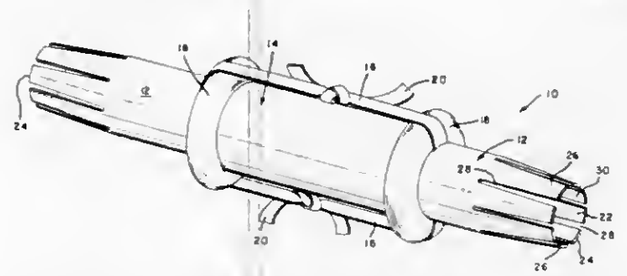
a plurality of circumferentially-spaced-apart screws in said ring pressing said bulkhead toward said seat to compress said seal, said ring being constructed and arranged to act as a strong spring in the axial direction of said tubular casing to compress said seal in a resilient manner.

4,029,895

RE-ENTERABLE SPLICE CASE

Grover Harry Scarborough, Exton, Pa., assignor to AMP Incorporated, Harrisburg, Pa.

Filed Oct. 12, 1976, Ser. No. 731,181
Int. Cl.² H02G *15/18*
U.S. Cl. 174—138 F **3 Claims**



1. A splice case for removably covering a splice area between two cables, comprising:

a. an elongated generally rigid sleeve adapted to be positioned over a splice area between two cables;

b. an elongated resilient cover of elastomeric material supported on the sleeve and adapted to be rolled out over the sleeve and onto the cables extending out from either end of the sleeve; and

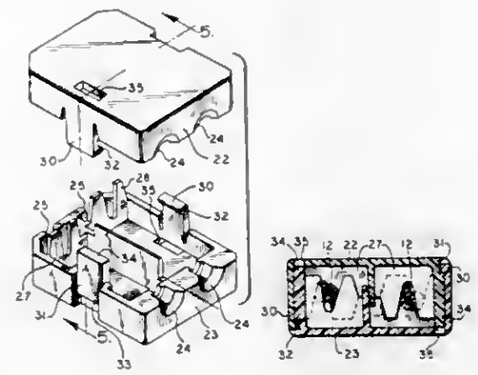
c. a pair of ribbons of tear resistant material positioned diametrically between the sleeve and cover, said ribbons being adapted to roll up the ends of the cover by grasping the ribbon ends and pulling back toward the other end of the sleeve.

4,029,896

TERMINAL HOUSING FOR AN ELECTRICAL RESISTANCE HEATER

Charles A. Skinner, Columbia, Md., assignor to Electro-Therm, Inc., Laurel, Md.

Filed Oct. 22, 1975, Ser. No. 624,697
Int. Cl.² H01R *13/48;* **H05B** *3/06;* **H01R** *13/58*
U.S. Cl. 174—138 F **3 Claims**



1. A housing for use in enclosing the connections between first and second electrical conductors and the terminals of an electric resistance heating element, said housing comprising, in combination:

first and second identical interlocking electrically non-conductive housing sections, each of said housing sections including a base portion, and a side wall portion projecting from said base portion and forming a compartment therewith, and side wall portion having a rim, and

means including a first pair of recesses on said rim for receiving in cooperation with a pair of like recesses on the other of said housing sections when said housing sections are locked together rim-to-rim respective ones of said electrical conductors, and means including a second pair of recesses on said rim opposite said first pair of recesses for receiving in cooperation with a pair of like recesses on the other of said housing sections when said housing are locked together rim-to-rim respective ends of said electrical resistance heating element, and

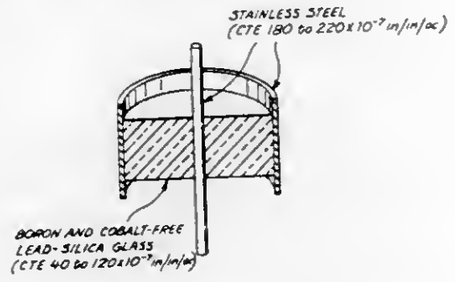
means including a divider wall portion projecting above said rim from said base portion and extending through said compartment from a first location on said side wall portion between said first pair of recesses to a second location on said side wall portion between said second pair of recesses for dividing said compartment into first and second electrically-isolated sections, said divider wall portion being disposed parallel to and adjacent one side of a plane bisecting said compartment whereby said wall portion comes into substantially contiguous surface to surface engagement with the wall portion of the other of said housing sections when said housing sections are locked together rim-to-rim; and

means including a locking tab portion projecting from said rim of said side wall portion, and a tab receiving portion disposed on said side wall portion opposite said tab portion for receiving a like tab portion on the other of said housing sections in locking engagement when the rims of said housing sections are brought into contact to lock said housing sections together about said connections.

4,029,897
GLASS SEAL

Peter Mayer, Burlington; M. Krishna Murthy, Toronto; Albert H. Brooks, Agincourt, and John A. Topping, Oakville, all of Canada, assignors to Quality Hermetics Limited, Toronto, Canada

Filed Aug. 7, 1975, Ser. No. 590,309
Int. Cl.² C03C *27/02, 3/10;* **H01B** *17/30*
U.S. Cl. 174—152 GM **9 Claims**



1. A seal construction comprising an inner electrically-conductive member, an outer electrically-conductive member and a glass sealingly joining said electrically-conductive members, said glass being formed from a boron- and cobalt-free lead-silica glass containing the following relative proportions of lead oxide and silica:

PbO	about 45 to about 65 wt. %
SiO_2	about 55 to about 35 wt. %

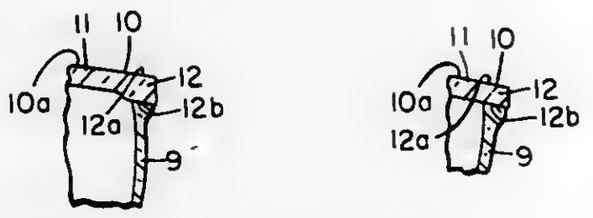
and the following other components in quantities based on the total weight of lead oxide and silica:

Al_2O_3	about 3 to about 4 wt. %
ZnO	about 7 to about 8 wt. %
CaO	0 to about 6 wt. %
BaO	0 to about 7 wt. %
Bi_2O_3	0 to about 7 wt. %.

4,029,898
TELEVISION PICTURE TUBE FACE PLATE

Yilmaz C. Belentepe, Corning, and Wendell S. Blanding, Painted Post, both of N.Y., assignors to Corning Glass Works, Corning, N.Y.

Filed Mar. 24, 1976, Ser. No. 670,046
Int. Cl.² H01J *5/02, 29/02*
U.S. Cl. 358—247 **8 Claims**



1. A face plate for a television picture tube envelope, such face plate having a uniformly convexly curved outside surface and comprising:

A. a viewing area of a generally uniform thickness throughout the areal expanse thereof;

B. adjacent to and surrounding the outer perimeter of said viewing area an annular area of a generally greater thickness than said viewing area and of a generally uniformly diminishing thickness, such annular area including,

I. a region of maximum thickness at the ends of the minor axis of the face plate,

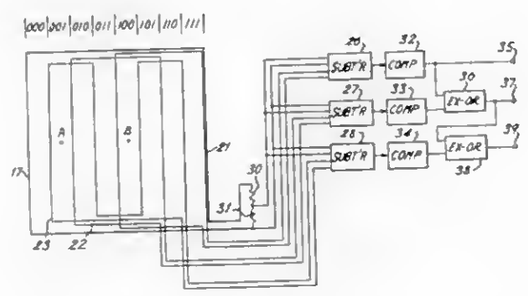
II. a region of minimum thickness at the ends of the diagonal axis of the face plate, and

III. a region of intermediate thickness at the ends of the major axis of the face plate.

4,029,899
POSITION INDICATOR

John Ashley Gordon, Hatfield, England, assignor to National Research Development Corporation, London, England

Filed Nov. 14, 1975, Ser. No. 632,176
Claims priority, application United Kingdom, Nov. 20, 1974, 50200/74; May 27, 1975, 23141/75
Int. Cl.² H04N *1/00;* **G08C** *21/00*
U.S. Cl. 178—19 **21 Claims**



1. Apparatus for generating a signal representative of a co-ordinate of a movable indicating member, the member being constructed to interact with magnetic flux, and the apparatus including:

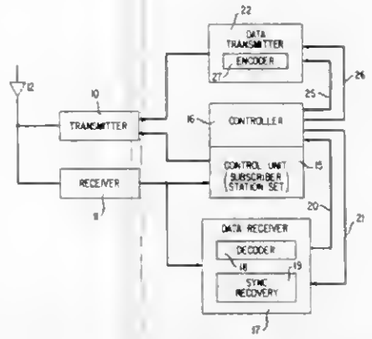
a plurality of sensing coils, positioned substantially in or adjacent to a real or imaginary surface in or adjacent to which the indicating member may be moved, the sensing coils overlapping in the direction of a required co-ordinate in the surface, and being positioned to divide an area of interest in the surface into regions, each coil encircling part of said area of interest having conductors in the said area substantially along region boundaries only, and each region being within an arrangement of the sensing coils particular to that region, a further coil, positioned substantially in or adjacent to the said surface and surrounding the entire area of interest, and

means responsive to change in magnetic flux passing through the said area of interest by way of the indicating member for providing signals representative of the co-ordinate of the indicating member, by separately combining signals from said further coil with signals from each of said sensing coils to provide a group of binary signals indicative of said coordinate

4,029,900
DIGITAL SYNCHRONIZING SIGNAL RECOVERY CIRCUITS FOR A DATA RECEIVER

Eric John Addeo, Long Valley, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Jan. 26, 1976, Ser. No. 652,170
Int. Cl.² H04L *7/00*
U.S. Cl. 178—69.1 **25 Claims**



1. In a synchronizing signal recovery circuit for a receiver for data signals having a predetermined word rate, a predetermined bit rate, and a predetermined synchronizing character rate,

means for indicating the presence of a predetermined synchronizing character in the data signal,

a circuit for deriving an approximate bit rate timing signal from the data signals,

means, responsive to the timing signal, for producing a substantially stable clock signal at the bit rate of the data signal, and

means, responsive to the stable bit rate clock signal and the character indicating means output, for initiating the production of a train of word synchronizing pulses only after the occurrence of at least two of the indicating pulses in coincidence with the stable bit clock pulses, successive ones of the indicating pulses being spaced by only a word synchronizing time interval of the data signal.

19. A digital phase comparator comprising

input connections for receiving first and second input signals of variable phase difference to be compared in phase,

means for generating a pulse train at the frequency of one of said signals, and

means for inhibiting the first pulse of said train after each change in the sign of the phase difference between said first and second signals.

4,029,901
CONTROL CENTER FOR A COMMUNICATIONS SYSTEM WITH INTERCHANNEL PATCHING CAPABILITIES

Whitney Robertson Campbell, Elk Grove Village, Ill., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Nov. 13, 1975, Ser. No. 631,784
Int. Cl.² H04Q *7/04*
U.S. Cl. 179—2 E **7 Claims**

1. A control center for a radio communications system with interchannel patching capabilities comprising:

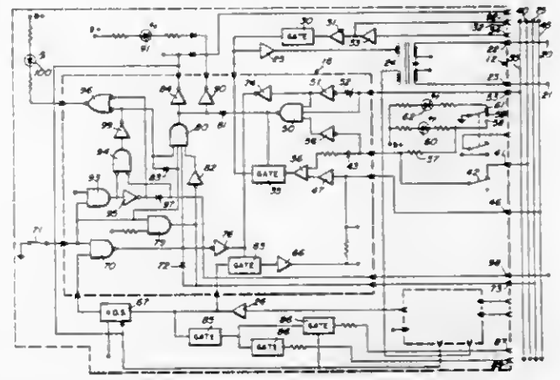
a. a housing adapted to have a plurality of control modules electrically and mechanically engaged therein;

b. a plurality of electrically conductive buses mounted in said housing;

c. a plurality of dedicated control modules having a front panel and mounted in said housing, each of said modules being adapted to be electrically connected to a transmitter/receiver base station for controlling all communications to and from its respective base station on an associated communications channel and for controlling the operation of said base station, each of said modules further having a plurality of terminals thereon one each of which is electrically connected to each of said buses;

d. a switch mounted on the front panel of each of said control modules; and

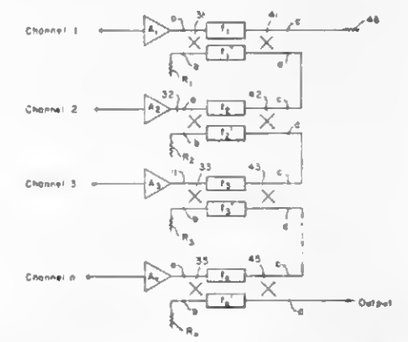
e. a plurality of patch boards one each mounted on each of said plurality of control modules each of said patch boards including associated circuitry electrically connected to the plurality of terminals, to various communications output terminals on the mounted control module and to said switch on the front panel, said switch being connected to provide electrical contact between predetermined ones of the various communications output terminals and predetermined ones of the plurality of terminals for providing selected patching between said normally dedicated communications chanels.



4,029,902
CONTIGUOUS CHANNEL MULTIPLEXER

H. Clark Bell, Jr., Sepulveda, and Harold A. Rosen, Santa Monica, both of Calif., assignors to Hughes Aircraft Company, Culver City, Calif.

Filed Oct. 22, 1975, Ser. No. 624,801
Int. Cl.² H04J *1/08*
U.S. Cl. 179—15 FD **11 Claims**

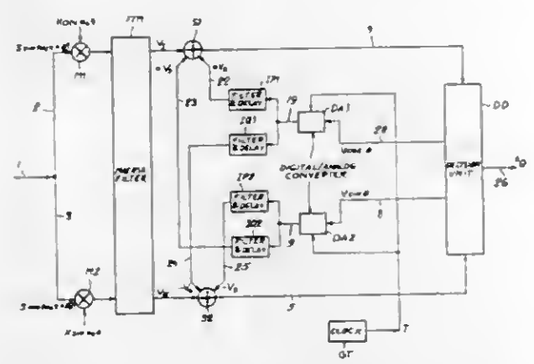


1. A multiplexer of the type comprising a plurality of directional filters each having at least one input port and an output port, said input ports being adapted to receive signals extending over predetermined bands of frequencies, said filter output ports being connected in a cascaded transmission path to a multiplexer output port, the transmission characteristics of said multiplexer from the respective input ports of a given filter to said multiplexer output port being a function of the transmission coefficient of that filter and the reflection coefficient of the succeeding filters along said transmission path, the improvement comprising the extension of at least one of the cutoff frequencies of preselected ones of said filters into the bandpass region of a channel next adjacent thereto in frequency.

4,029,903
RECEIVER FOR PSK DIGITAL SIGNALS

Giovanni Tamburelli, Torino, Italy, assignor to CSELT - Centro Studi E Laboratori Telecomunicazioni, Torino, Italy

Filed Oct. 6, 1975, Ser. No. 620,140
Claims priority, application Italy, Oct. 4, 1974, 69965/74; Apr. 2, 1975, 67850/75
Int. Cl.² H04B 1/00
U.S. Cl. 178—88 10 Claims



1. In a receiver for digital signals transmitted via two conjugate carrier waves of like frequency identifying n different signal levels, in combination:

first and second demodulating means for deriving from said carrier waves a first and a second input voltage defining respective coordinates of an orthogonal matrix divided into n sectors each representing one of said signal levels;

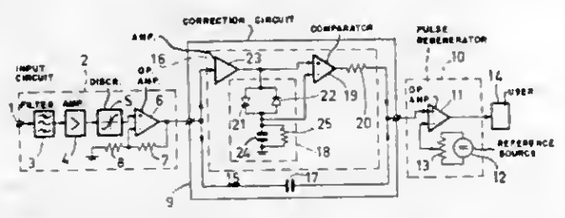
decision means connected to said demodulating means for generating an angle signal, depending on the magnitudes of said input voltages and identifying the corresponding sector, and two collateral signals representing conjugate trigonometric functions of said angle signal; and

feedback means connected to said decision means for converting said collateral signals into at least two corrective voltages and superimposing same upon succeeding first and second input voltages to compensate for distortions determined by the preceding input voltages.

4,029,904
RECEIVER CIRCUIT FOR AUTOMATIC CORRECTION OF DC LEVEL DISTURBANCES

Roberto Papeschi, Milan, Italy, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Nov. 24, 1975, Ser. No. 634,769
Claims priority, application Italy, Nov. 27, 1974, 29912/74
Int. Cl.² H04L 15/24
U.S. Cl. 178—88 7 Claims

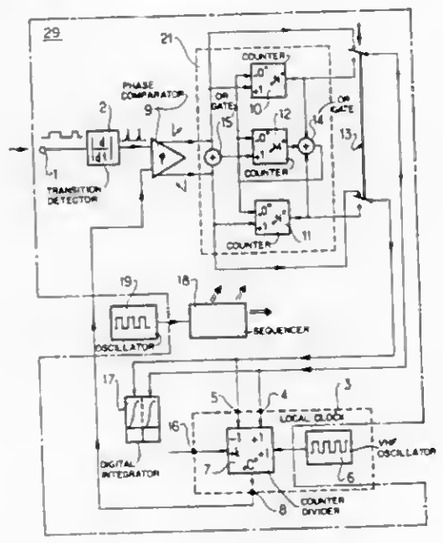


1. A receiver in a transmission system for binary pulse signals, including an input circuit having a low output impedance from which the base band binary pulse signals are derived, a circuit connected to the input circuit for automatic correction of disturbances in the DC level of the binary pulse signals caused during transmission, and a pulse regenerator having a high input impedance to which the correction circuit and a reference source are connected for regenerating the binary pulse signals, said correction circuit comprising two parallel branches whose inputs are connected to the input circuit and whose outputs are connected to the pulse regenerator, the first branch including a series capacitor and the second branch including a peak detector for deriving a threshold signal from the peak values of the binary pulse signals and a comparator for generating a binary decision signal in response to both the threshold signal and the binary pulse signals, said comparator being coupled via a resistor to the output of the second branch, the time constant constituted by the resistor in the second branch and by the series capacitor in the first branch being much larger than the duration of an element in the binary pulse signals to suppress in said binary decision signal a.c. components related to transitions in the binary pulse signals so that the second branch passes d.c. components of the binary pulse signals.

4,029,905
APPARATUS FOR DETECTING THE RHYTHM OF AN NRZ MESSAGE

Michel Abraham, St Michel sur Orge, France, assignor to Compagnie Industrielle des Telecommunications Cit-Alcatel, Paris, France

Filed Nov. 17, 1975, Ser. No. 633,017
Claims priority, application France, Nov. 25, 1974, 74.38586
Int. Cl.² H04I 7/00
U.S. Cl. 178—88 6 Claims

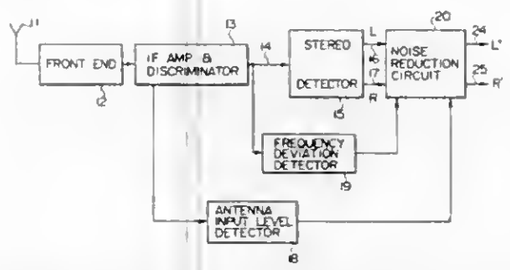


1. An apparatus for detecting the rhythm of an NRZ message, comprising: a binary-level transition detector (2) for receiving the message and delivering a pulse for each change in binary polarity; a phase-controllable local clock oscillator (3, 6) for delivering clock pulses at the rhythm of the message: a phase comparator (9) for comparing the phase of the clock pulses with the phase of the pulses delivered by said transition detector, and in turn delivering control pulses that selectively advance and delay the phase of said clock oscillator; an integrator assembly (17, 23–25) for integrating the control pulses and sending out a signal indicating the existence of a message when the number of advance control pulses reaches a first threshold, the number of delay control pulses remaining under a second threshold; and a command unit (18, 19) for defining cyclically groups of three operating periods, the first one for phase locking of said clock oscillator, the second being initiated by a sudden phase shift of said clock oscillator and the operation of said integrator assembly, and the third period being reserved for reading and evaluating the state of said integrator assembly, selectively in accordance with the presence and absence of a message.

4,029,906
AUTOMATIC NOISE REDUCTION SYSTEM OF FM STEREO RECEIVER

Shinobu Takahashi, Mitaka, Japan, assignor to Sansui Electric Co., Ltd., Tokyo, Japan

Filed Apr. 14, 1976, Ser. No. 676,860
Claims priority, application Japan, Apr. 18, 1975, 50-51984[U]
Int. Cl.² H04H 5/00
U.S. Cl. 179—15 BT 10 Claims



1. An FM stereo receiver comprising:

demodulation circuit means having first and second audio outputs for demodulating stereophonically related audio signals from an FM stereo transmission signal which is received by an antenna and providing the stereophonically related audio signals on said first and second audio outputs;

first detection means for detecting input level of the FM stereo transmission signal which is received by the antenna to produce a first control signal having a voltage level corresponding to the input level;

second detection means for detecting carrier frequency deviation of the FM stereo transmission signal to produce a second control signal having a voltage level corresponding to the carrier frequency deviation; and

control circuit means coupled to said first and second audio outputs of said demodulation circuit means and to said first and second detection means for, when at least one of the input level and the carrier frequency deviation of the FM stereo transmission signal decreases, reducing separation between said first and second audio outputs of said demodulation circuit means and attenuating high frequency components at each of said first and second audio outputs of said demodulation circuit means,

said control circuit means including a first blend circuit coupled between said first and second audio outputs of said demodulation circuit means for blending high frequency components at said first and second audio outputs, a second blend circuit coupled between said first and second outputs, for blending low, intermediate and high frequency components at said first and second audio outputs, and first and second attenuating circuits respectively coupled to said first and second audio outputs for attenuating high frequency components at said first and second outputs.

4,029,907
ASYNCHRONOUS DIGITAL REPEATER

Adam A. Jorgensen, Rochester; Norman L. Rose, Penfield, and Thomas F. Lewis, Macedon, all of N.Y., assignors to Stromberg-Carlson Corporation, Rochester, N.Y.

Continuation-in-part of Ser. No. 593,660, July 7, 1975, abandoned. This application July 13, 1976, Ser. No. 704,984
Int. Cl.² H04Q 1/36
U.S. Cl. 179—16 EA 3 Claims

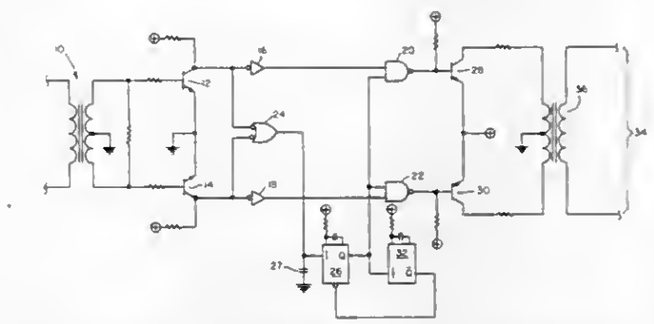
1. An asynchronous, regenerative, digital repeater circuit for use in a bipolar signalling system comprising:

a. a first monostable multivibrator having a characteristic period approximately equal to the design duration of the pulses to be repeated,

b. means for triggering said multivibrator in response to the leading edge of each of each received pulse,

c. a second monostable multivibrator having a period approximately equal to one-half the duration of the time slot assigned to each received pulse, said second multivibrator being connected to an output of said first multivibrator to be triggered on the trailing edge of each pulse produced by said first multivibrator, an output of said second multivibrator being connected to said first multivibrator to inhibit said first multivibrator during time-out of said second multivibrator, and

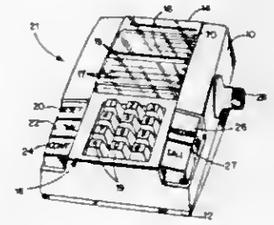
d. means for producing a bipolar train of output pulses in response to the output of said first multivibrator.



4,029,908
REPERTORY DIALER LOGIC

Robin C. Moseley, Andover, and Richard A. Brisk, Arlington, both of Mass., assignors to DASA Corporation, Andover, Mass.

Filed Nov. 24, 1975, Ser. No. 634,474
Int. Cl.² H04M 1/46
U.S. Cl. 179—90 BB 22 Claims



1. A telephone dialer comprising:

a magnetic tape transport including a magnetic tape for containing recorded data representative of telephone numbers and magnetic record-reproduction means operative to selectively record on or read from said tape;

keyboard means for manual entry of telephone number data;

an electronic temporary memory operative to store telephone number data derived from said magnetic tape or said keyboard means;

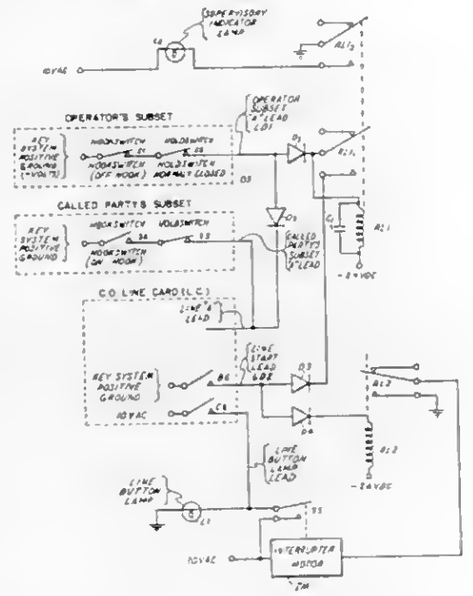
control means operative to selectively cause transfer of telephone number data from said magnetic tape to said temporary memory and from said keyboard means to said temporary memory; and

output circuit means operative in response to telephone number data stored in said temporary memory to provide telephone dialing signals for conveyance over a telephone line thereby to dial the telephone number represented by said stored telephone number data.

4,029,909
OPERATOR SUPERVISORY CIRCUIT FOR A KEY TELEPHONE SYSTEM

James Edwin Hinkle, Palmyra, Pa., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed Mar. 23, 1976, Ser. No. 669,427
Int. Cl.² H04M 1/00
U.S. Cl. 179—99 9 Claims



1. An operator supervisory circuit for a key telephone system comprising:
- a source of key system positive ground;
- a single hold button operator's subset coupled to said source;
- a single hold button called party's subset;
- a supervisory indicator lamp;
- a line button lamp; and
- a switching arrangement including only relays and relay contacts coupled to said operator's subset, said source, said indicator lamp and said line button lamp to light said indicator lamp when said operator's subset is taken off-hook to answer an incoming call, to cause said line button lamp to wink at a given rate when said operator's subset is placed on hold to disperse said incoming call to said called party's subset, to extinguish said indicator lamp and said line button lamp wink when said called party's subset is taken off-hook, and to cause said line button lamp to again wink at said given rate when said called party's subset is placed on hold after said called party's subset has been taken off-hook.

4,029,910
WIDE DISPERSION LOUDSPEAKER WITH FLEXING DIAPHRAGM

Roy F. Allison, Wayland, Mass., assignor to Allison Acoustics, Inc., Natick, Mass.

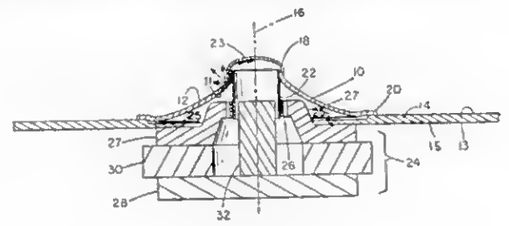
Continuation-in-part of Ser. Nos. 465,856, May 1, 1974, abandoned, and Ser. No. 617,067, Sept. 26, 1975, abandoned.
This application July 9, 1976, Ser. No. 704,068
Int. Cl.² H04R 7/12, 7/18, 9/06
U.S. Cl. 179—115.5 ME 10 Claims

1. In an audio speaker system comprising a mounting panel having a front surface facing towards a listening space and a loudspeaker secured to said panel for projecting sound directly into said listening space forward of said front surface, said loudspeaker comprising a diaphragm rotationally symmetrical about an axis generally perpendicular to said front surface, a voice coil former secured to said diaphragm, a voice coil secured to said voice coil former, and magnetic structure for driving said voice coil, that improvement wherein:

said diaphragm defines a sound propagating surface extending from a larger circular edge of said diaphragm to a smaller circular edge of said diaphragm spaced apart from said larger circular edge along said axis in the direction towards said listening space;

said voice coil former is secured to said diaphragm adjacent said smaller edge;

said sound propagating surface faces towards said listening space and is curved such that the included, initially acute, angle between a tangent to said sound propagating surface and said axis continuously increases as the point of



tangency moves from said smaller edge to said larger edge; and

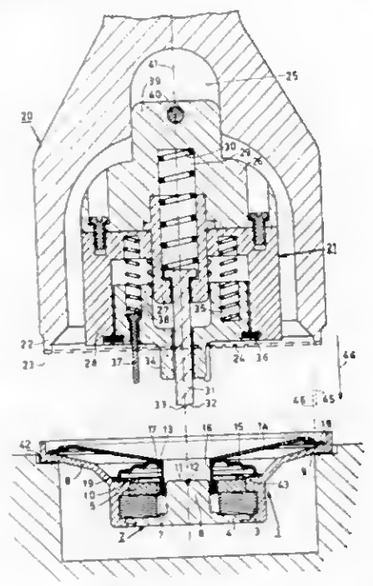
said loudspeaker includes means causing vibration of said voice coil parallel to said axis to produce vibration of said sound propagating surface having in phase components of velocity both parallel and perpendicular to said axis, said means including fixing said larger edge relative to said mounting panel,

whereby said loudspeaker projects sound into the full 2 π steradian solid angle on the side of said front surface towards said listening space.

4,029,911
ELECTRO-ACOUSTIC TRANSDUCER AND METHOD OF MANUFACTURING SUCH A TRANSDUCER

Walter Albinger, Vienna, Austria, assignor to U.S. Philips Corporation, New York, N.Y.

Filed Apr. 28, 1976, Ser. No. 680,904
Claims priority, application Austria, Apr. 29, 1975, 3300/75
Int. Cl.² H04R 7/18, 9/04, 31/00
U.S. Cl. 179—115.5 ES 6 Claims

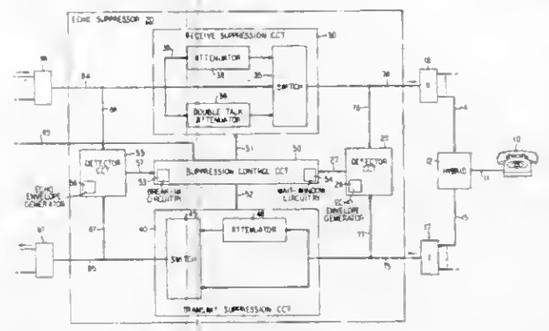


1. An electro-acoustic tranducer comprising a chassis having a contact surface, and a vibratory diaphragm having an edge, wherein said contact surface is formed of a plastic material, and said vibratory diaphragm is attached to the contact surface by an ultrasonic weld.

4,029,912
COMMON CONTROL DIGITAL ECHO SUPPRESSOR

Alfred Antonio Gelgel, Dunellen, and Robert Ernest LaMarche, Atlantic Highlands, both of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Dec. 10, 1975, Ser. No. 639,348
Int. Cl.² H04B 3/20
U.S. Cl. 179—170.2 19 Claims



8. An echo envelope generator comprising means for detecting peak magnitudes of input signals, first storing means for following increasing magnitude input signals and for storing the highest peak magnitude detected, first timing means responsive to the storing of a peak magnitude in said first storing means for initiating a predetermined timing interval, second timing means including a timer and means responsive to the detection of each input signal peak magnitude for restarting said timer, second storing means for storing the magnitude of the next-to-highest peak occurring after the peak magnitude stored in said first storing means, control circuit means responsive to the termination of said predetermined interval of time for transferring said next-to-highest peak magnitude from said second storing means and for storing it in said first storing means, said control circuit means being operative upon the storing of a peak magnitude from said second storing means in said first storing means for reducing said predetermined timing interval in accordance with the state of said timer, and output means connected to said first storing means for using said peak magnitude stored therein less a predetermined loss to generate an echo envelope corresponding to said input signals.

4,029,913
REMOTE ACCESSING SYSTEM FOR TELEPHONE LINES

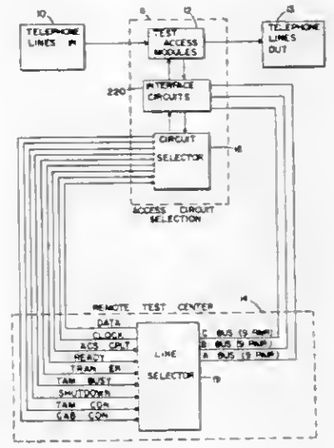
Richard A. Gunderson, Eden Prairie, Minn., assignor to Magnetic Controls Company, Minneapolis, Minn.

Filed Mar. 31, 1976, Ser. No. 672,406
Int. Cl.² H04B 3/46
U.S. Cl. 179—175.3 R 29 Claims

1. A system for accessing communication lines from a remote position comprising electronic access circuit selecting means at the communication lines and remote line selecting means at the remote position;

said access circuit selecting means having line selection data decoding means connected to operate access switching means, said switching means operable to connect a selected communication line to a selected transmission bus which transmission bus is routed to the remote line selecting means, and said access circuit selecting means further having automatic, sequentially programmed status determining means connected to said data decoding means and said access switching means and operable to direct status information to the remote line selecting means;

said remote line selecting means having status reviewing means connected to said status determining means and line selection data encoding means connected to said reviewing means and to said decoding means, said encoding means operable upon the reception of appropriate status information from the access circuit selecting means to transmit line selection data to the decoding means, and manual line selection data entry means at the remote

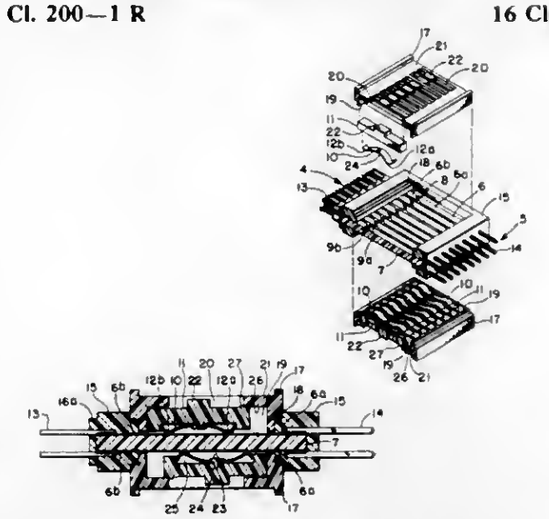


position to supply line selection data to the encoding means.

4,029,914
MULTIPLE SWITCH MECHANISM

Gary M. Schmidt, Cleveland; Robert J. Gabor, Mentor, and John T. Venaleck, Painesville, all of Ohio, assignors to A P Products Incorporated, Painesville, Ohio

Filed Apr. 14, 1976, Ser. No. 676,900
Int. Cl.² H01H 9/00, 15/00
U.S. Cl. 200—1 R 16 Claims



1. A multiple switch mechanism connectable on-line between one multi-conductor electrical cable termination assembly device, a receptacle device for the latter, or a like device and another similar device for selectively opening and closing respective electrical circuits therebetween, comprising:
- a plurality of first electrical contact means for connection with the respective contacts of such a device,
- a plurality of second electrical contact means for connection with the respective contacts of the other such device,
- a plurality of individually selectively operable slide switch means respectively electrically connected between said first and second electrical contact means for opening and closing respective circuit paths therebetween, said plurality of slide switch means including an electrically nonconductive support and a plurality of electrical conductors on said support, each of said plurality of electrical conductors including a pair of generally linearly extending conductor parts separated by an electrical discontinu-

ity therebetween, and each of said slide switch means including electrically conductive slide means in engagement with a respective electrical conductor and slidable thereon to a first position for completing a circuit path between said conductor parts across a respective electrical discontinuity and to a second position to open such circuit path, thereby to close and to open, respectively, respective electrical circuits between such devices, and,

dielectric housing means for holding in a common package at relative locations said first and second electrical contact means and said slide switch means, said dielectric housing means including a body of electrically non-conductive material integrally molded about at least respective portions of said electrical contact means, said support, and said electrical conductors to form an integral structure therewith.

4,029,915

MINIATURIZED CALCULATOR KEYBOARD SWITCH ASSEMBLY HAVING UNIVERSALLY PIVOTED KEY ACTUATORS

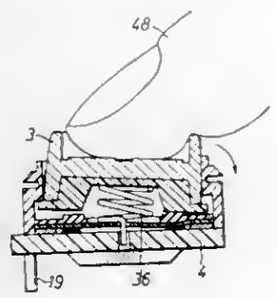
Shin Ojima, Yao, Japan, assignor to Hoshidenkoseizo Kabushiki Kaisha, Yao, Japan

Filed Dec. 3, 1975, Ser. No. 637,264

Claims priority, application Japan, Dec. 12, 1974, 49-143295

Int. Cl.² H01H *13/70, 25/00;* **G06F** *7/38*

U.S. Cl. 200—5 A **2 Claims**



1. A portable electronic calculator comprising:

a body;

a keyboard consisting of a plurality of keys housed in said body and exposed to the outside of said body through openings formed in the body, the keys of said keyboard being aligned with one another in a single row;

an indicator for displaying the result of a calculation; said indicator being housed in the body and exposed to the outside of said body through an elongated opening formed in said body, said elongated indicator opening being disposed in alignment with said single row of keys;

said keyboard including a plurality of resilient members each of which is retained at one end thereof by an engaging portion formed on the inside of one of said keys respectively, each of said resilient members being secured at its other end to a stationary portion of said body, each of said keys being normally held in a predetermined neutral position by its associated resilient member and being adapted to be tilted forwardly, backwardly, to the right, and to the left when the key is so depressed by the finger tip of a user on the front surface of the key;

said keyboard further including a set of four make-and-break contacts housed in the body in opposing relation to the inside of each of said keys, different ones of said contacts being selectively actuated in accordance with the direction of tilting of the key when the key is tilted;

an integrated calculator circuit housed in said body for receiving a signal based on the operation of each of the make-and-break contacts by the key operation to perform a calculation and to supply the result of the calculation to said indicator for viewing by the user through said elongated indicator opening; and

a power source housed in said body for supplying power to said integrated calculator circuit and to said indicator.

4,029,916

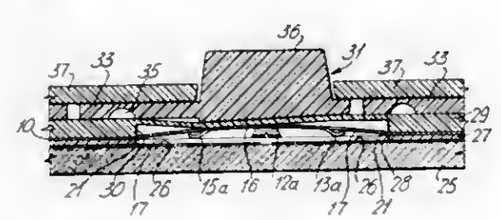
MULTI-CONTACT PUSH-BUTTON SWITCH AND PLURAL EMBODIMENT FOR KEYBOARD SWITCH ASSEMBLY

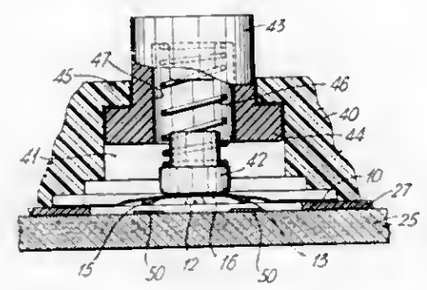
Pak-Jong Chu, Ottawa, Canada, assignor to Northern Electric Company Limited, Montreal, Canada

Filed Apr. 18, 1975, Ser. No. 569,381

Int. Cl.² H01H *13/70, 1/14*

U.S. Cl. 200—5 A **6 Claims**





1. A pushbutton switch including a flat spring plate having a switch position comprising:

a pre-stressed domed portion extending upwardly from said flat spring plate and having a central portion and a plurality of radial webs connecting said central portion and said flat spring plate, said flat spring plate surrounding said domed portion, said flat spring plate integral with the outer ends of said radial webs to constrain said webs radially and circumferentially;

an upwardly bent portion at the junction between each web and said flat spring plate, said bent portion constraining said webs to deflect radially inward of said bent portion;

a plurality of cantilevered spring contact members extending from said centre portion, a contact member between at least one adjacent pair of radial webs and extending a radial distance less than said radial webs, said contact member extending downward from said domed portion toward the plane of said flat spring plate;

a contact area at the radially outward end of each contact member;

a circuit member positioned below and spaced from said flat spring plate and including contact areas beneath said contact areas of said spring contact members;

a pushbutton mounted above said flat spring plate, over said domed portion to apply a downward force thereto, to deflect said domed portion;

said domed portion, on application of said downward force, arranged to snap downward toward said circuit member, said domed portion constrained by said upwardly bent portion to return said domed portion to an undeflected position.

4,029,917

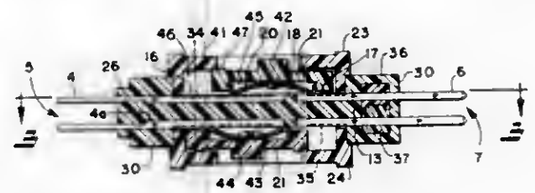
MOLDED MULTIPLE SWITCH MECHANISM

John L. Webster, Painesville, Ohio, assignor to A P Products Incorporated, Painesville, Ohio

Filed June 21, 1976, Ser. No. 698,117

Int. Cl.² H01H *9/00, 15/00*

U.S. Cl. 200—5 R **12 Claims**



1. A multiple switch mechanism connectable on-line with one multi-conductor electrical cable termination assembly device, a receptacle device therefor or like device and another similar device for selectively opening and closing electrical circuits therebetween, comprising:

a plurality of first electrical contacts,

a plurality of second electrical contacts,

electrically non-conductive housing means for holding said first electrical contacts in paired and electrically isolated alignment, respectively, with said second electrical contacts, said housing means including a body of electrically non-conductive material molded directly about portions of said electrical contacts forming an integral structure therewith,

each of said electrical contacts including one end portion means exposed relative to said body for connecting to respective external contacts or the like of such device,

each of said electrical contacts further including an opposite end portion means within said housing means and exposed therein for providing respective first and second fixed switch contacts in such paired alignment relation, and

a plurality of slide contact means in said housing means selectively slidable on respective electrical contact opposite end portion means for closing and opening respective circuit paths between respective aligned pairs of said first and second electrical contacts respectively to open and close such electrical circuits therebetween.

4,029,918

CONTINUOUS CYCLE TIMER HAVING ADJUSTABLE DAY AND TIME PERIODS OF OPERATION

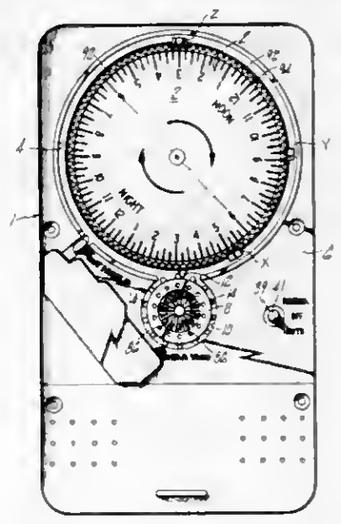
Carl L. C. Kah, Jr., 778 Lakeside Drive, North Palm Beach, Fla. 33408

Filed Mar. 27, 1975, Ser. No. 562,650

Int. Cl.² H01H *43/00*

U.S. Cl. 200—38 D **35 Claims**

1. A timing device having a mounting means, electrical input connectors connected to said mounting means, electrical output connectors connected to said mounting means, a first dial mounted for rotation on said mounting means, a second dial mounted for rotation on said mounting means, an actuation lever, means mounting said actuation lever between its ends on said mounting means for movement by said first and second dials, first contacting means on said first dial for engaging a first part of said actuation lever on one side of said means mounting said actuation lever, second contacting means on said second dial for engaging a second part of said actuation lever on the other side of said means mounting said actuation lever, switch means connected to said mounting means, said switch means including means for actuating said switch means, said switch means being electrically connected between said output and said input connectors for electrically connecting them, said means for actuating said switch means being located adjacent said actuation lever for selective movement thereby so that when only one contacting means engages its part of the actuation lever said actuation lever will not move to in turn move said means for actuating said switch means to actuate said switch means but when said other contacting means engages its respective part of said actuation lever at the same time said actuation lever will move to in turn move said means for actuating said switch means to actuate said switch means.



4,029,919

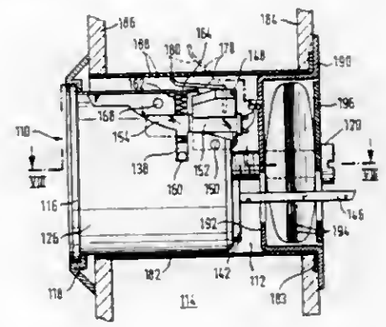
LOCKING ARRANGEMENT WITH BURGLAR ALARM

Edgar Lumme, Telgte, Westflaen, Germany, assignor to Aug. Winkhaus, Telgte, Germany

Filed Jan. 21, 1976, Ser. No. 650,934

Int. Cl.² H01H *35/00*

U.S. Cl. 200—52 R **11 Claims**



1. A locking arrangement comprising:

a. a casing element defining an axis of rotation;

b. a cylinder element mounted in said casing element for angular movement about said axis and formed with a key slot extending inward of one axially terminal face of said cylinder element;

c. tumbler means in said elements for normally preventing said angular movement and responsive to a key inserted in said key slot for permitting said movement;

d. a spring member having a portion radially projecting from said casing element, said portion being axially movable relative to said casing element, said spring member being stressed resiliently when said portion is moved in one axial direction;

e. first and second contact means mounted on said casing element in electrically insulated relationship; and

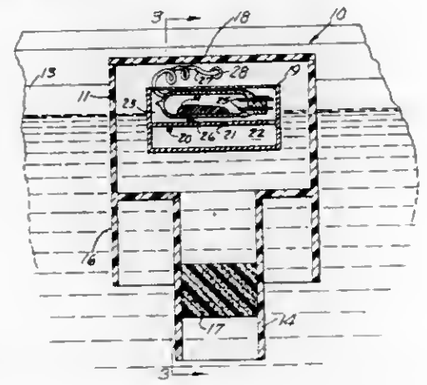
f. motion transmitting means interposed between said spring member and said first contact means for biasing said first contact means toward a circuit opening position remote from said second contact means in response to said stressing of said spring member, and for conductively engaging said first and second contact means in response to movement of said portion in the other axial direction.

4,029,920

FLOAT TYPE ELECTRIC CIRCUIT BREAKER FOR SWIMMING POOLS

Donald W. Odell, 8301 Hidden Valley Circle, Fair Oaks, Calif. 95628

Filed Jan. 29, 1976, Ser. No. 653,515
Int. Cl.² H01H 35/18
U.S. Cl. 200—84 B 5 Claims



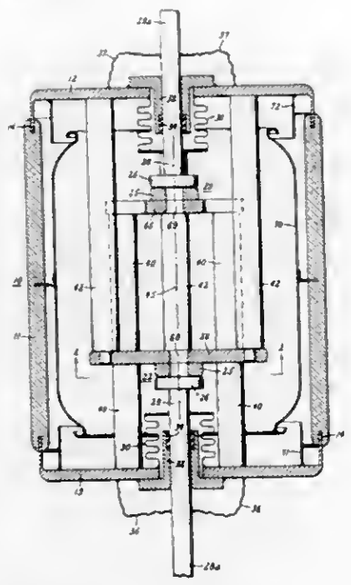
1. A float type electric circuit breaker for swimming pools comprising a housing, means securing said housing to the upper edge or skimmer recess of a swimming pool, a float mounted in said housing for pivotal movement about a horizontal pivot extending through said housing and said float, a mercury switch mounted on a roller in said float and electrically connected to a swimming pool control valve, a tube depending from said housing and communicating therewith for permitting a flow of water into and out of said housing, and means in said tube for preventing surge flow of water therethrough, whereby water inflow and outflow in the housing is buffered for the purpose of monitoring only static water level.

4,029,921

VACUUM-TYPE CIRCUIT INTERRUPTER WITH TWO SETS OF CONTACTS ELECTRICALLY IN PARALLEL

Joseph A. Rich, Schenectady, N.Y., and Joseph C. Sofianek, Broomall, Pa., assignors to General Electric Company, Philadelphia, Pa.

Filed July 1, 1975, Ser. No. 592,303
Int. Cl.² H01G 33/66
U.S. Cl. 200—144 B 10 Claims



1. In a vacuum-type circuit interrupter:
a. a highly evacuated envelope comprising an insulating housing and first and second metal end caps at opposite ends of said housing,
b. a first plurality of rod electrodes within said envelope mounted on said first end cap and electrically connected to said first end cap when the interrupter is open,
c. a second plurality of rod electrodes within said envelope mounted on said second end cap and electrically connected to said second end cap when the interrupter is open,
d. said first and second pluralities of electrodes being positioned so as to form a ring of electrodes within said envelope, the electrodes of said first plurality interleaving with and longitudinally overlapping the electrodes of said second plurality and being spaced circumferentially of said ring from the immediately adjacent electrodes of said second plurality, said electrodes alternating in polarity about said ring when the interrupter is open, whereby inter-electrode gaps are defined between the juxtaposed interleaving electrodes of said ring,
e. a first generally stationary contact, first conductive support structure extending transversely of said rod electrodes and attached to the distal ends of predetermined rod electrodes of said second plurality, and means for supporting said first generally stationary contact on said first support structure in a position intermediate the locations at which said first support structure is attached to said predetermined rod electrodes of said second plurality,
f. a second generally stationary contact, second conductive support structure extending transversely of said rod electrodes and attached to the distal ends of predetermined rod electrodes of said first plurality, and means for supporting said second generally stationary contact on said second support structure in a position intermediate the locations at which said second support structure is attached to said predetermined rod electrodes of said first plurality,
g. said first and second stationary contacts being disposed in positions spaced longitudinally of the longitudinally axis of said ring,
h. first and second movable contacts within said envelope for respectively engaging said first and second generally stationary contacts,
i. a first movable contact rod on which said first contact is mounted extending in sealed relationship through said first metal end cap,
j. a second movable contact rod on which said second contact is mounted extending in sealed relationship through said second metal end cap,
k. said two pairs of engageable contacts being electrically connected in parallel with each other while said interrupter is closed.

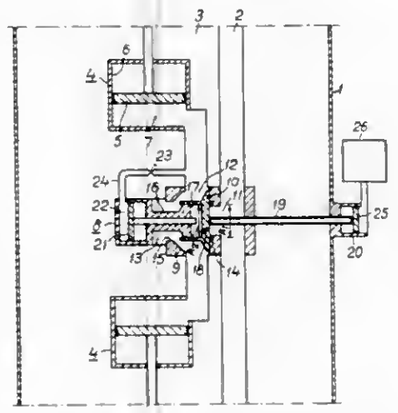
4,029,922

OPERATING DEVICE FOR ENCLOSED HIGH VOLTAGE CIRCUIT BREAKERS

Sten Berneryd, and Per-Olof Grune, both of Ludvika, Sweden, assignors to ASEA Aktiebolag, Vasteras, Sweden

Filed Sept. 4, 1975, Ser. No. 610,433
Claims priority, application Sweden, Oct. 1, 1974, 7412319
Int. Cl.² H01H 33/54
U.S. Cl. 200—148 D 5 Claims

1. An operating device for a high-voltage circuit breaker enclosed in an elongated casing (1) filled with compressed gas and comprising a high-pressure chamber (2) and a low-pressure chamber (3), a driving means (4) operated by compressed gas and including a pressure chamber (7), a compressed gas valve means (8) for alternatively connecting said driving means to the high-pressure chamber and the low-pressure chamber, said valve means having first and second openings (11,13) into the high-pressure chamber and the low-pressure chamber, respectively, communicating with the pressure chamber, a valve seat (14) around the first opening, a movable valve member (10) engageable with said valve seat to close the first opening, means (17) forming a space on the opposite side of the valve member from the first opening, means (18) permanently connecting said space with the high-pressure chamber, an impulse member (20) outside the high-



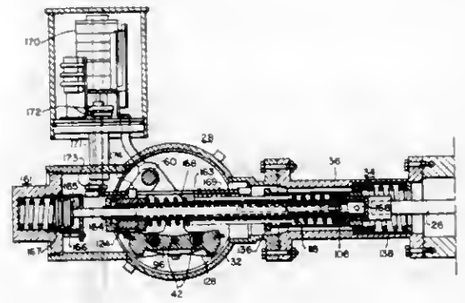
pressure chamber, an operating rod (19) extending substantially perpendicular to the longitudinal axis of the casing operatively connected to the impulse member and the valve member for moving the valve member away from the valve seat, and means responsive to movement of the valve member away from the valve seat to close the second opening.

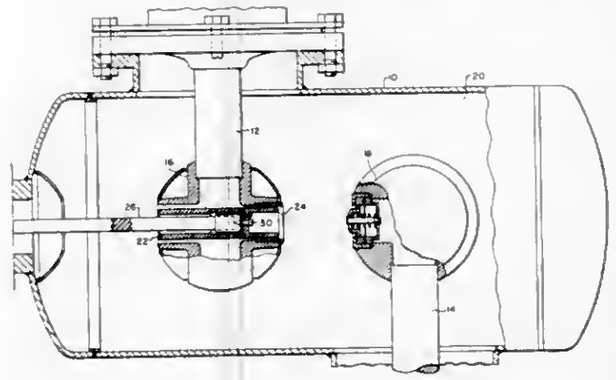
4,029,923

MAGNETIZING CURRENT SWITCH

Jeffry R. Meyer, Pittsburgh, and Sylvester J. Dropik, Jeannette, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Jan. 15, 1976, Ser. No. 649,181
Int. Cl.² H01H 1/44
U.S. Cl. 200—163 11 Claims





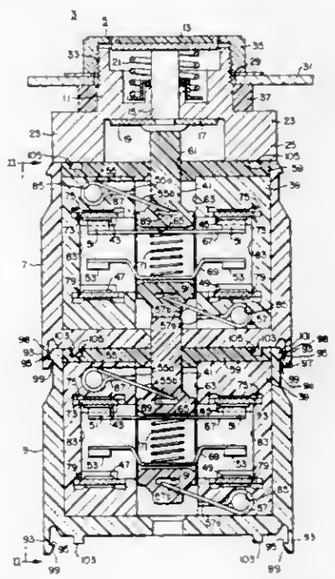
1. A magnetizing current switch comprising:
a sealed housing including two spaced-apart electrical conductors;
a movable contact disposed within said sealed housing and capable of being in two positions, one of said contact positions being in electrical contact with both of said conductors to permit the flow of electric current therebetween, the other of said contact positions being spaced apart from at least one of said conductors to prohibit the flow of electric current therebetween;
a rotatable drive shaft;
turning means for rotating said drive shaft;
drive means, coupled to said drive shaft, for positioning said movable contact, said drive means translating said shaft rotation to a generally straight-line motion; and
a movable insulating rod secured to said movable contact and coupled to said drive means, said straight-line motion of said drive means positioning said movable contact through said insulating rod.

4,029,924

CONTACT BLOCK INTERLOCK FOR ELECTRIC SWITCH

Stanley L. Frank, and Stephen S. Dobrosielski, both of Beaver, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Continuation-in-part of Ser. No. 515,944, Oct. 10, 1974, abandoned. This application Sept. 16, 1975, Ser. No. 613,839
Int. Cl.² H01H 13/00
U.S. Cl. 200—307 1 Claim



1. An electric switch asembly comprising at least two contact blocks stacked in end-to-end surface abutment and on a longitudinal axis, each contact block having stationary and movable contacts, each block also having movable contact operating means including a guided reciprocable plunger, the plunger in each block being in end-to-end abutment with the plunger of an adjacent block, manual means adjacent to one block and operatively connected to the plunger thereof, interlock means interconnecting adjacent blocks against longitudinal movement and comprising elongated hook-like members on one block detachably engaged with projections on another adjacent block, each reciprocable plunger being biased in a desired position by a pair of springs operatively connected thereto, and each spring having one outturned end portion bearing against the block and having another outturned end portion bearing against the plunger.

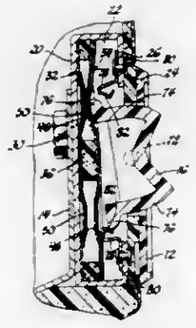
ELECTRIC SWITCH

James A. Biske, Sterling Heights, Mich., assignor to General Motors Corporation, Detroit, Mich.

Filed Apr. 5, 1976, Ser. No. 673,637
Int. Cl.² H01H 3/00
U.S. Cl. 200—339 1 Claim



1. In switch apparatus of the type including first and second pairs of contacts in a housing, one contact of each pair being mounted on a sheet of flexible material separated from the other contacts of each pair by resilient means disposed therebetween, the resilient means being adapted to bias both pairs of contacts into disengagement but being locally deformable to allow separate engagement of either of said pairs of contacts; the improvement comprising, in combination:

a rocker member pivotably supported in the housing and adapted for pivotal reciprocation by an external operator between first and second positions, the rocker member having a pair of legs, one of the legs being effective to engage the first pair of contacts and cause engagement thereof in the first position and to withdraw therefrom and allow disengagement thereof by the resilient means in the second position, the other leg being effective to engage the second pair of contacts and cause engagement thereof in the second position and withdraw therefrom and allow disengagement thereof by the resilient means in the first position; and

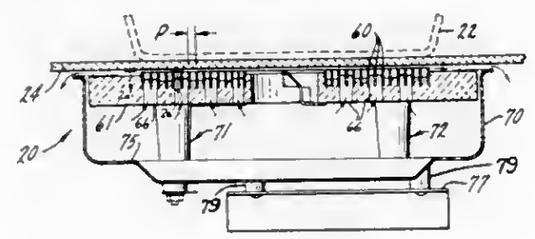
a pair of spring detents in the housing, each spring detent comprising a resilient metallic strip having one end fastened to the housing and another end spaced from the housing for engagement with one of the rocker legs, one of the spring detents being adjacent each of the legs and effective, upon rotation of the rocker member to the position in which the adjacent leg is withdrawn from its associated set of contacts and the other leg is biasing the other set of contacts into engagment, to engage the adjacent leg and thus hold the rocker member in position and the other pair of contacts in engagement against the bias of the resilient means exerted on the other leg.

4,029,926
WORK COIL FOR USE IN AN INDUCTION COOKING APPLIANCE

Buddy Julian Austin, Lafayette, Ind., assignor to Roper Corporation, Kankakee, Ill.

Filed Oct. 29, 1974, Ser. No. 518,773
Int. Cl.² H05B 9/02; H01F 27/28
U.S. Cl. 219—10.49 17 Claims

1. In a solid state induction cooking appliance for producing heat in a metallic utensil by means of an ultrasonic frequency magnetic field, said appliance including a solid state inverter having a resonant circuit comprising a capacitor and inductor, an improved work coil in said appliance for generating the ultrasonic frequency magnetic field and coupling said field to the utensil comprising a solid single strand conductor, said conductorbeing wound in a single layer spiral to form a substantially flat coil, the winding pitch being related to the radial thickness of the conductor by a thickness-to-pitch ratio in the range between 0.3 and 0.7, said work coil being connected as the inductor in said inverter for resonating with said capacitor at an ultrasonic frequency whereby resonant exchange of

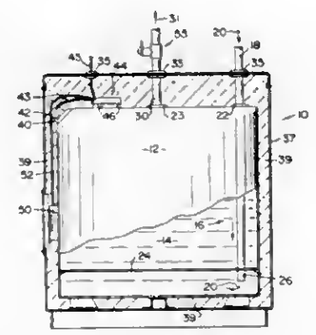


energy between said work coil and capacitor causes said work coil to generate said ultrasonic frequency magnetic field.

4,029,927
MICROWAVE WATER HEATER

Hugh G. McMillan, 2920 Walnut St., Tampa, Fla. 33607

Filed Nov. 28, 1975, Ser. No. 636,117
Int. Cl.² H05B 9/06
U.S. Cl. 219—10.55 R 7 Claims

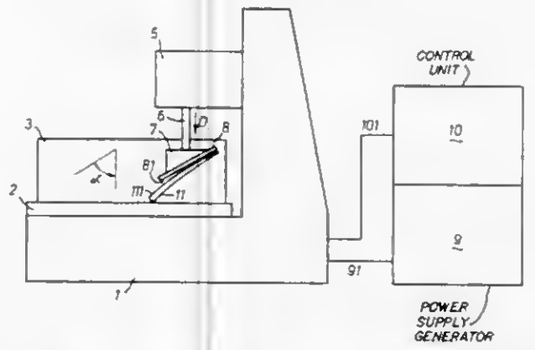


1. A water heater assembly of the type primarily designed for domestic use, said water heater assembly comprising: water storage means including a tank, inlet means interconnected between a water supply and the interior of said tank, outlet means interconnected between the interior of said tank and a desired point of water delivery; insulation means mounted on the exterior of said tank in at least partially surrounding relation thereto; microwave generator means connected to said storage means and disposed to direct wave energy to the water within said tank, regulating means interconnected in current regulating position between a current source and said microwave generator, temperature sensing means mounted on said storage means in temperature sensing disposition relative to the water within said tank and in current regulating relation to said microwave generator; safety means interconnected to said regulating means and disposed in direct heat conducting relation to said tank, so as to sense the temperature thereof; said assembly further comprising distribution means mounted on the interior of said tank, said distribution means comprising a plate element having apertures formed therein and disposed substantially uniformly in said plate so as to define fluid communication therethrough between opposite sides of said plate, said plate element disposed in transverse relation relative to water flow between said inlet means and said outlet means, said plate being configured and disposed to allow water, issuing from said water inlet to pass through said apertures in a dispersed fashion so as to be distributed evenly throughout said tank, whereby wave energy directed to the water from said microwave generator causes temperature increase therein.

4,029,928
ELECTRO-EROSION MACHINE TOOLS

Werner Ullmann, Locarno, and Ferdy E. Hermann, Luzern, both of Switzerland, assignors to A.G. fur industrielle Elektronik AGIE Losone b. Locarno, Losone, Switzerland

Filed Apr. 28, 1975, Ser. No. 572,087
Claims priority, application Switzerland, Sept. 16, 1974, 12550/74
Int. Cl.² B23P 1/08; C25C 7/02
U.S. Cl. 219—69 E 7 Claims



1. An electro-erosion machine tool for machining a multidimensionally curved surface (111) on a workpiece (11), the machine tool comprising

support means (2) for supporting said workpiece;

a tool electrode (3) having an electro-erosion machining face (31) presented to said workpiece (11);

and feed means (5, 6, 7) coupled to said tool electrode (8) to move the machining face (81) thereof relative to the workpiece to advance the tool electrode towards said workpiece;

wherein, in accordance with the invention,

the tool electrode (8) has its machining face (81) inclined at an angle of inclination (c) with respect to the direction of movement (D) of the feed means (5, 6, 7);

the machining face (81) of the tool (8), for a convex surface to be machined, has a larger radius of curvature than the curvature of the curved surface (11) to be machined on said workpiece;

and curve direction movement means (10, 78, 82, 83, 85, 86) are provided to cause, upon feed of the tool electrode at said angle of inclination to simultaneously effect electro-erosive machining, shifting of the tool electrode with respect to the workpiece, and a rolling movement of the machining face (81),

said curve direction movement means comprising a part (78) which is fixed in relation to the said tool electrode (8) and which defines a guide face, and template means (82, 83) which is fixed in relation to said workpiece and which is in engagement with said guide face so as to guide the tool electrode to move in relation to said workpiece along said path.

4,029,929
ELECTRICAL DISCHARGE MACHINING DEVICE FOR CUTTING WITH WIRE ELECTRODE

Frank P. Rietveld, Matthews, N.C., assignor to Colt Industries Operating Corporation, New York, N.Y.

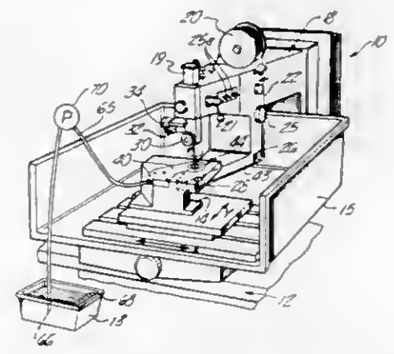
Filed Jan. 27, 1975, Ser. No. 543,989
Int. Cl.² B23P 1/08
U.S. Cl. 219—69 W 9 Claims

1. A wire cutting type electrical discharge machining tool operable to provide an incrementally controlled movement of a wire electrode relative to a workpiece in a cutting operation, and further operable to provide a tapered cut to said workpiece at the same time, wherein the improvement comprises:

a pair of guide rollers for supporting said wire electrode in a cutting path;

a plug having an eccentric opening formed therein for passing said wire electrode therethrough with a degree of eccentricity having a direct relationship to the degree of taper desired for the workpiece opening;

means for supporting said plug intermediate the pair of guide rollers, each roller located proximate a different outer surface of the workpiece; said rollers vertically displaced, one from the other, and the rotative drive of said plug is provided by a fluid driven impeller, said impeller and said plug both being mounted proximate the

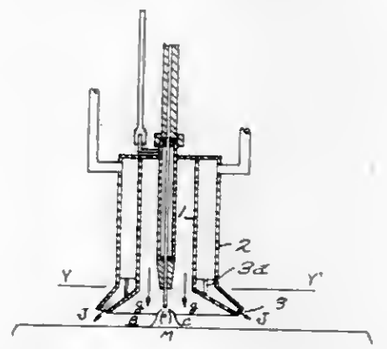


lower of said rollers and intermediate it and said upper roller, said impeller being rotatively driven through an impinging stream of fluid, said fluid and said impeller contained in a chamber, said chamber having a plurality of fluid exit holes proximate its lower surface for allowing a plurality of streams of fluid to exit and provide a continuous wetting for the wire electrode traversing therethrough, whereby the efficiency and uniformity of the cutting action of the wire electrode is greatly improved.

4,029,930
WELDING TORCH FOR UNDERWATER WELDING

Hideo Sagara; Yasuhiro Nishio; Hirokazu Wada, and Yoshinori Hiromoto, all of Hiroshima, Japan, assignors to Mitsubishi Jukogyo Kabushiki Kaisha, Tokyo, Japan

Filed Aug. 2, 1973, Ser. No. 384,897
Claims priority, application Japan, Sept. 4, 1972, 47-87934
Int. Cl.² B23K 9/16
U.S. Cl. 219—74 4 Claims



1. A welding torch for underwater welding, comprising:

an inner tubular member having a flaring tip end portion;

an outer tubular member having a flaring tip end portion, radially outwardly spaced from the flaring tip end portion of the inner tubular member to provide an annulus between the inner and outer tubular members and defining an injection nozzel between said flaring tip end portions;

means for supplying welding rod means through the inner tubular member toward a region disposed centrally of the flaring tip end portion of the inner tubular member;

means for supplying a supply of weld-shielding gas to said region;

means for supplying water through said annulus, for flowing radially outwards as a flaring curtain form said injection

nozzle with sufficient force as to prevent water surrounding the torch from invading said region during under water welding,

the flaring of the tip end portion of the inner tubular member bears such relation of degree to the flaring of the tip end portion of the outer tubular member that the transverse cross sectional area of the annulus decreases toward the outer extents of said tip end portions to accelerate the velocity of the water issuing from said annulus;

whereby, when said torch is in use under water with said tip end portions adjacent a member to be welded,

a welding arc may be sustained at said region, with said gas driving water from said region, shielding the welding and escaping radially outwardly across said tip end portions into said curtain of water.

4,029,931

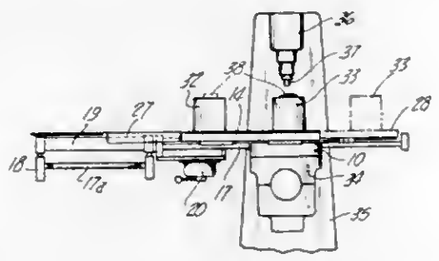
SLIDING TABLE FOR RESISTANCE WELDING

Walter P. Simmons, Birmingham, Mich., assignor to Tuffaloy Products, Inc., Sterling Heights, Mich.

Filed Oct. 31, 1975, Ser. No. 627,504

Int. Cl.² B23K *37/04*; **B21J** *13/08*

U.S. Cl. 219—78 **5 Claims**



1. A sliding, current conducting, work-piece holding, movable table for a resistance welding machine providing reliable conductivity in the welding position and a loading-unloading station spaced from the welding position to eliminate danger of injury to the operator, comprising,

a base mountable on a resistance welding machine below the welding head,

at least two horizontal slide rails lying on and over said base and extending laterally outwardly of said base on at least one side of said base beyond the welding head; each said rail having a bottom portion connected to said base and an upwardly extending top portion;

said top portion of each said rail comprising opposite flat sides lying on opposite angles converging upwardly toward one another,

a table over-lying said slide rails; said table having means forming bottom slide channels partially receiving said top portions of said slide rails,

each said slide channel having opposite flat sides lying on opposite angles converging upwardly into said table;

the angulation of said sides of said slide rails and the angulation of said sides of slide channels being substantially equal to provide a close interfit therebetween to provide a large area of mutual contact to facilitate transfer of welding current:

said table being slidable on said rails between a welding position below a welding head and a loading-unloading position outwardly of a welding head:

said slide rails and said slide channels under the force exerted by the welding head being jammed in substantially solid electrical contact due to their mutual angular interface allowing slight motion toward one another from a slidable to a jammed condition.

4,029,932

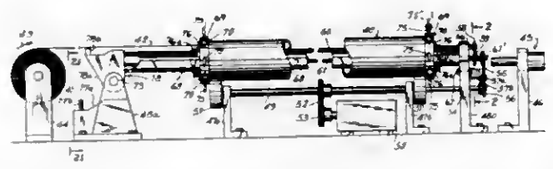
LINED PIPE, AND METHOD AND APPARATUS FOR MAKING SAME

Melvin S. Cook, Saddle River, N.J., assignor to Holobeam, Inc., Paramus, N.J.

Filed May 5, 1975, Ser. No. 574,537

Int. Cl.² B23K *26/00*; **F16L** *9/14*

U.S. Cl. 219—121 LM **88 Claims**



1. Apparatus for lining the inside wall of a pipe comprising means external to said pipe for feeding a continuous strip of lining material into one end of said pipe, means for moving inside said pipe from one end thereof to the other to lay down said strip against the pipe wall, means for controlling relative rotational movement between said pipe and said lay-down means so that said strip is wound against the pipe wall, the relative linear speeds and the relative rotational speeds of said pipe and said lay-down means being such that said strip is laid down against the pipe wall by said lay-down means in a helical shape with continuous overlapping edge regions, and means for welding together said continuous overlapping edge regions.

4,029,933

METHOD OF VERTICAL WELDING OF ALUMINUM AND ALUMINUM ALLOYS

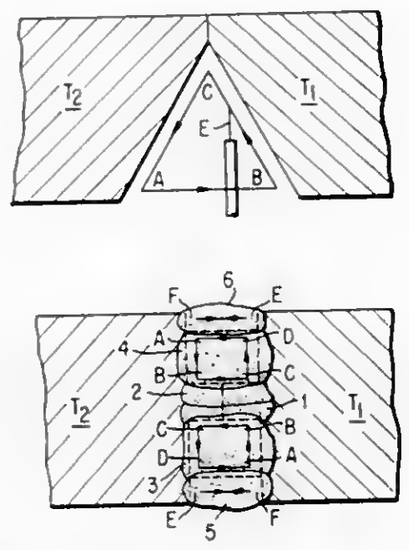
Minoru Oishi; Naoki Okuda, both of Fujisawa; Makoto Tomita, Yokohama; Nobumasa Ohkubo, Yamato; Kazuo Kogane, and Kazuo Yonezawa, both of Kamakura, all of Japan, assignors to Kobe Steel Ltd., Kobe, Japan

Filed Feb. 10, 1975, Ser. No. 548,624

Claims priority, application Japan, Nov. 14, 1974, 49-131728

Int. Cl.² B23K *9/12*

U.S. Cl. 219—126 **7 Claims**



1. A method of vertical welding of aluminum and aluminum alloys comprising:

welding aluminum or an aluminum alloy with at least a base welding current while oscillating in a welding groove an electrode in a closed pattern corresponding substantially to the groove shape,

wherein the welding is conducted by using an additional current higher by 10 to 150 A than said base welding current at least during the course of oscillation of the electrode along the groove face of one of the materials to be welded while the electrode is pursuing courses of oscillation along both the groove faces of the materials to be welded.

4,029,934

WELDING, AND A STEEL SUITABLE FOR USE THEREIN

Allan Clark, Newton Aycliffe, and Philip Robert Kirkwood, Middlesbrough, both of England, assignors to British Steel Corporation, London, England

Continuation of Ser. No. 497,089, Aug. 13, 1974, abandoned. This application Sept. 3, 1976, Ser. No. 720,358

Claims priority, application United Kingdom, Aug. 20, 1973, 39235/73

Int. Cl.² B23K *35/08, 35/22, 35/36*; **C22C** *38/14*

U.S. Cl. 219—145 **8 Claims**

1. A consumable welding wire for a source of filler metal for a weldment, said wire consisting essentially of:

Carbon 0.15% max
Manganese 0.5–1.5%
Silicon 0.03–0.10%
Molybdenum 0.2–0.6%
Aluminum 0.02% max
Titanium 0.03–0.05%
Boron 0.002–0.008%
Sulphur 0.04% max
Phosphorus 0.04% max
Iron and incidental impurities Balance.

4,029,935

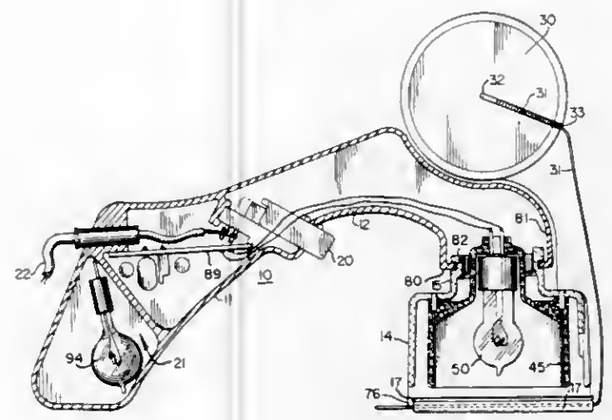
TOOLS FOR APPLYING HEAT IN EDGE BANDING OPERATIONS

Winfield S. Archer, Levittown, and Joseph Trus, Yardley, both of Pa., assignors to Blaine G. Greenwell, Honolulu, Hawaii

Filed May 20, 1975, Ser. No. 579,146

Int. Cl.² H05B *1/00*; **B30B** *15/34*; **D06F** *75/24*

U.S. Cl. 219—228 **10 Claims**



1. A hand held heating tool particularly adapted for accommodating an edge banding operation, wherein a tape having a hot melt adhesive backing is emplaced to cover an exposed edge of a surface of a panel with said tape, comprising:

a. a housing including a handle portion for grasping of the same by a user,

b. a barrel portion rotatably coupled to said housing and having a front section relatively transverse to said handle portion, said front section of said barrel portion having a bottom aperture communicating with an internal hollow within said front section,

c. placement means coupled to said front section of said barrel portion and positioned about the periphery of said aperture,

d. a heat conducting platen dimensioned to cover said aperture and having a top surface including means adapted to coact with said placement means to removably position said platen to cover said aperture, and a bottom surface including a predetermined shaped guide channel for enabling said tool to be moved along said edge to be banded,

e. tape dispensing means coupled to said housing and positioned such that a tape accommodated by said means is directed within said guide channel with said hot melt adhesive backing facing said edge, and

f. radiant heating means located in said hollow of said housing to transfer heat to said top surface of said platen and therefore to said bottom surface by radiation to heat said platen to a temperature sufficient to melt said adhesive, whereby due to said radiation, said platen can be removed and replaced when desired.

4,029,936

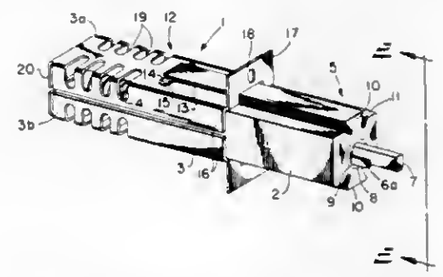
IGNITER ASSEMBLY

Ronald D. Schweitzer, Mansfield, Ohio, assignor to The Tappan Company, Mansfield, Ohio

Filed Jan. 13, 1975, Ser. No. 540,349

Int. Cl.² F23Q *7/00*

U.S. Cl. 219—267 **26 Claims**



1. An igniter assembly, comprising an electric resistance igniter element having relative high and low temperature portions, discrete spaced apart terminal parts connected to the latter portion for connection to a source of electric energy, electrically conductive means for connecting said terminal parts to a source of electric energy for energization of said electric resistance igniter element, an electrically non-conductive holder means for supporting said electric resistance igniter element, said holder means having opposite ends, means for directly mechanically connecting said low temperature portion of said electric resistance igniter element to said holder means proximate one end of the latter, said holder means having interior passageway means for directing said electrically conductive means through said holder means for connection to a source of electric energy, at least a portion of said electric resistance igniter element low temperature portion extending into said interior passageway means of said electrically non-conductive holder means, and shield means secured to said holder means and extending beyond said one end over at least a substantial portion of said electric resistance igniter element high temperature portion for shielding at least a portion of the latter.

4,029,937

CONTROL SYSTEM FOR ELECTRICALLY CONDUCTIVE LIQUID HEATING APPARATUS

Robert G. Russell, 21011 S. Figueroa St., Carson, Calif. 90745

Filed Oct. 4, 1974, Ser. No. 512,093

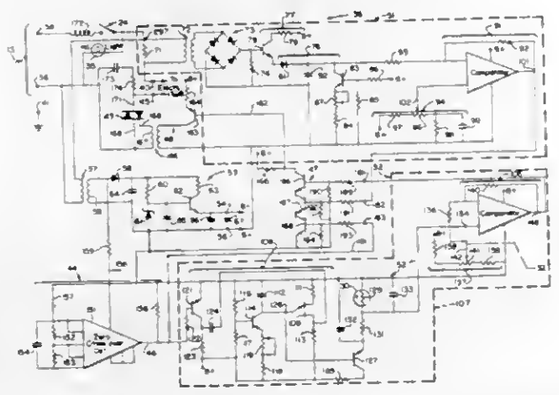
Int. Cl.² H05B *3/60, 1/02*; **F24H** *1/10*

U.S. Cl. 219—295 **7 Claims**

1. Apparatus for controlled heating of a flowing liquid capable of conducting electrical current, comprising:

at least one pair of spaced electrodes disposed to contact said flowing liquid for passing an electrical current therethrough;

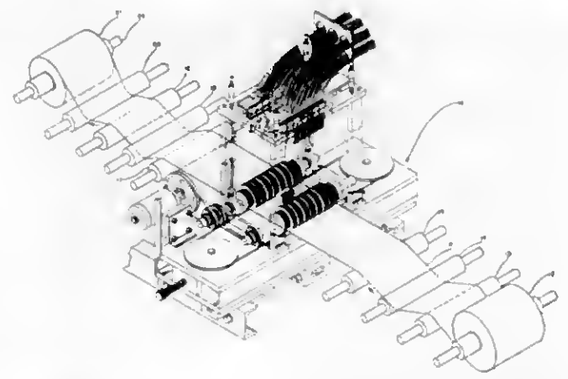
terminal means adapted for connection to a source of alternating current;
triggerable alternating current switching means connected to said terminal means and to said electrodes for selectively connecting said alternating current to said electrodes for passing said electrical current through said liquid;
current sensing means for sensing the magnitude of current flow between said electrodes through said liquid;
temperature sensing and comparing means for sensing the temperature of said liquid after being heated by said current flow and electrically comparing said temperature with a preselected reference temperature; and
logic circuit means having inputs connected to said current sensing means and to said temperature sensing and comparing means and having an output connected to and for controlling said switching means for conditioning said switching means to pass said alternating current to said electrodes only during intervals when said current sensing means senses a current flow below a preselected maximum current and concurrently therewith said temperature sensing and comparing means senses a temperature of said liquid below said preselected reference temperature, whereby an alternating current is passed through the flowing liquid causing a rapid increase in temperature thereof until said preselected reference temperature is attained whereafter said alternating current is applied



intermittently to maintain said preselected reference temperature unless excessive current flow is encountered by reason of increased conductivity of said liquid whereupon said current flow is limited to said maximum current level with a concomitant decrease in the temperature level of the liquid below said preselected reference temperature,
said triggerable alternating current switching means comprising:
a solid state triac device connected in series with said electrodes;
zero crossover detector means adapted for connection to said source of alternating current for issuing a train of electrical pulses representing in time the zero crossing of said alternating current; and
trigger circuit means connected to said triac and to said logic circuit means for receiving said train of electrical pulses for triggering said triac to pass said alternating current to said electrodes for at least one half cycle of said alternating current following each such electrical pulse, whereby said triac is conditioned to pass a minimum quanta of electrical energy consisting of at least one half cycle of said alternating current in response to each pulse signal passed by said logic circuit means in accordance with the inputs thereto from said current sensing means and said temperature sensing and comparing means.

4,029,938
APPARATUS FOR ELECTRICALLY PERFORATING MOVING WEBS

Richard Hugo Martin, Pisgah Forest, N.C., assignor to Olin Corporation, Pisgah Forest, N.C.
Filed Feb. 2, 1976, Ser. No. 654,201
Int. Cl.² H05B *7/18*
U.S. Cl. 219—384 **6 Claims**



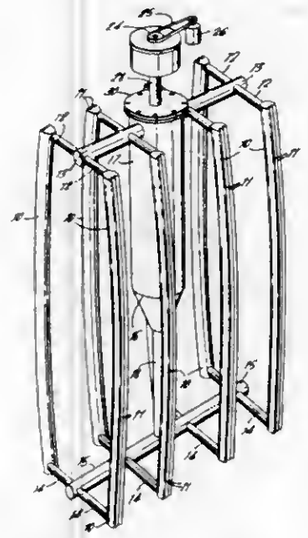
1. Apparatus for perforating a moving web of material by electric discharge comprising:
a. support means;
b. charged circular electrodes comprising a plurality of thin discs of equal diameter rotatably mounted on said support means and aligned axially in spaced relationship to each other, said discs electrically insulated from each other and from said support means;
c. means for rotating said discs on their axis;
d. a narrow ground electrode member mounted on said support means adapted to move at right angles to the direction of rotation of said discs and spaced parallel and in close proximity to the rims of said discs to provide a gap between the rims of said discs and said member;
e. means for moving said ground electrode member;
f. means for advancing a web through said gap; and
g. a pulsed high voltage power source connected to each of said discs providing intermittent charges to said discs and concomitant arcs across the gap between said discs and said ground electrode member, whereby a moving web of material is perforated as it passes through said gap.

4,029,939
APPARATUS FOR HEAT TREATMENT OF STRAND MATERIAL

Walter Parker, Wilmslow, England, assignor to Ernest Scragg & Sons Limited, Macclesfield, England
Filed May 21, 1975, Ser. No. 579,500
Claims priority, application United Kingdom, May 23, 1974, 23007/74
Int. Cl.² F27D *11/00*; **F28D** *15/00*
U.S. Cl. 219—388 **12 Claims**

1. Apparatus for heating strand material comprising two tubular liquid containing manifolds, a plurality of elongate tubular strand heater members each extending between and in

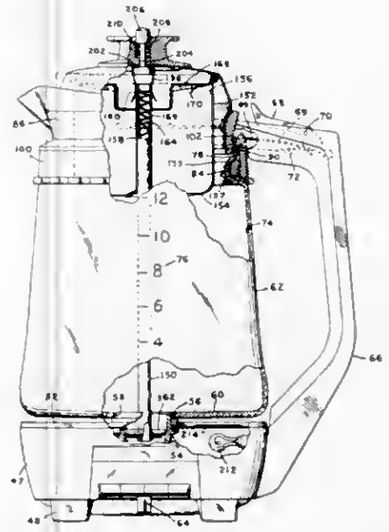
liquid flow connection with the two manifolds, a tubular housing also connected to the two manifolds, a liquid heating unit



and a liquid circulation pump, the heating unit and circulation pump being contained within the tubular housing.

4,029,940
PERCOLATOR

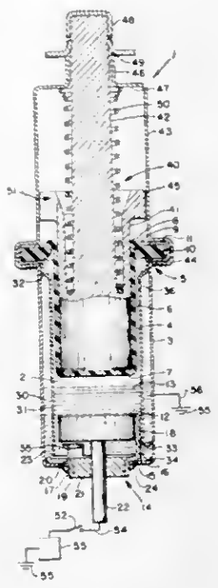
John Littell Eaton, Jr., Delanco, N.J.; Richard Henry Brill, and Walter E. Myers, both of Philadelphia, Pa., assignors to SCM Corporation, New York, N.Y.
Division of Ser. No. 451,336, March 18, 1974, Pat. No. 3,939,760. This application June 9, 1975, Ser. No. 584,795
Int. Cl.² H05B *1/02*
U.S. Cl. 219—506 **4 Claims**



1. An electrical circuit for lighting a lamp in response to the heating mode of an electric appliance comprising:
a pair of power terminals;
a primary heating means;
a secondary impedance means having first and second portions;
a lamp means;
a thermally sensitive switch means;
a first serially connected current loop including one of said power terminals, said thermally sensitive switch means, said primary heating means and said other of said power terminals;
a second serially connected current loop including one of said power terminals, said thermally sensitive switch means said first portion of said second impedance means, said lamp means and said other power terminal;
a third serially connected current loop including one of said power terminals, said thermally sensitive switch means, said second portion of said secondary impedance means, said lamp means and said other of said power terminals;
a fourth serially connected current loop including one of said power terminals, said thermally sensitive switch means, said first and second portions of said secondary impedance means, said primary heating means and the other of said power terminals;
said thermally sensitive switch means operative to conduct current in said first, second and third current loops to provide a high heat mode of operation and operative to conduct current in said third and fourth current loops in response to temperature sensed by said thermally sensitive switch means to provide a low heat mode of operation.

4,029,941
ELECTRIC HEATER ASSEMBLY

Richard G. Huebscher, Cleveland; Ronald S. Sobecks, Seven Hills, and Joseph A. Birli, Richmond Heights, all of Ohio, assignors to Gould Inc., Chicago, Ill.
Division of Ser. No. 623,669, Oct. 20, 1975, Pat. No. 3,991,572. This application Apr. 22, 1976, Ser. No. 679,460
Int. Cl.² H05B *1/02*
U.S. Cl. 219—511 **9 Claims**

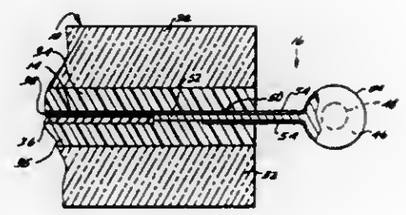


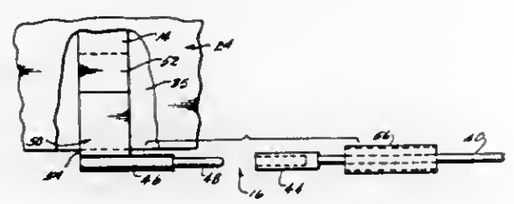
1. An electric heater assembly for a thermal actuator or the like having a substantially sealed chamber at least partially defined in a casing and thermally expansible material in said chamber, comprising an electrically conductive holder positionable in an opening through said casing and securable in sealed engagement with said casing, said holder having a generally central opening and an integral upstanding tab positioned to extend toward the interior of said chamber, an electrically conductive stud extending through said central opening, electrically non-conductive means for sealing said central opening with said stud securely positioned therein in electrically isolated relation with respect to said holder, and electric heater means for heating said material, said electric heater means being coupled to said tab and to said stud for mechanical support thereby and for electric energization thereof.

4,029,942
TRANSPARENT PRELAMINATE WITH ELECTRICAL CONNECTORS

Berton P. Levin, Santa Monica, Calif., assignor to The Sierracin Corporation, Sylmar, Calif.

Filed Aug. 27, 1975, Ser. No. 608,091
Int. Cl.² H05B *3/06*
U.S. Cl. 219—522 **15 Claims**





1. A prelaminate for a laminated electrically heatable window comprising:

a transparent sheet-like carrier film having a cut-out section adjacent an edge of the prelaminate,

an electrically resistive heating layer on a surface of the carrier film,

transparent, flexible, electrically insulated layers bonded to opposite surfaces of the carrier film, one of said insulated layers overlaying the electrically resistive heating layer,

a pair of conductive bus bars embedded between the electrically resistive heating layer and the insulated layer overlaying the electrically resistive heating layer,

a separate electrically conductive tab in electrical contact with each bus bar, each tab being disposed in a corresponding cut-out portion of the embedded carrier film, each tab also projecting outside the prelaminate away from an edge of the prelaminate, the electrically insulated layers overlaying and being bonded to the portions of the bus bars disposed in the cut-out sections of the carrier film,

separate electrical connectors on the remote ends of each tab outside the edge of the prelaminate, each electrical connector having an electrical contact for forming a cooperating electrically conductive pin-and-socket connection with a complementary electrical contact, and

means electrically insulating the portion of each tab extending outside the edge of the prelaminate and at least a portion of each tab bonded to the insulated layers.

4,029,943
METHOD AND APPARATUS FOR OPINION SURVEYS

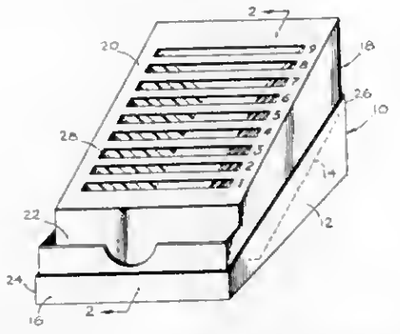
Henry Rodriguez, 8834 Saturn St., Los Angeles, Calif. 90035

Filed Dec. 12, 1975, Ser. No. 640,079
Int. Cl.² G07C *13/02*
U.S. Cl. 235—57 **5 Claims**

1. A polling box for use in poll-taking on issues having a scale of human responses thereto which lies over a range from agreement to disagreement, including:

a base portion having a front wall and a floor supported in said base portion and sloping downwardly toward said front wall, and,

a superstructure removable as a unit and sized to nest within said base portion and having a polling-scale surface sloped similarly to said floor in said base portion, said polling-scale surface having a plurality of slots therein adapted to receive cards bearing thereon recitations of

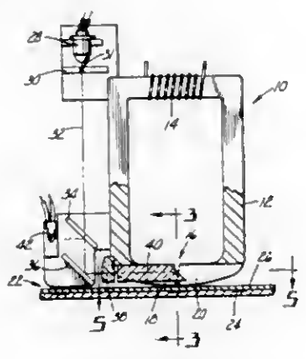


specific issues on which poll-taking is being conducted, each of said slots bearing a gradation identifier which lies in a progressive series of identifiers from the first of said slots to the last thereof, and each of said slots having separator means depending from opposite ends thereof for holding open removable envelopes placed beneath each of said slots to receive said cards.

4,029,944
DATA TRANSDUCER

Robert H. Trenkamp, Cleveland Heights, Ohio, assignor to Addressograph Multigraph Corporation, Cleveland, Ohio

Filed Apr. 7, 1976, Ser. No. 674,562
Int. Cl.² G06K *7/08, 7/10, 9/00*; **G11R** *5/12*
U.S. Cl. 235—61.11 D **13 Claims**



1. A data transducer for use with a data bearing member comprising:

a magnetic transducer having a core with a pair of spaced, oppositely disposed magnetic pole pieces, a narrow gap between said pole pieces, said gap defining a pair of spaced magnetic reluctance apertures, and an optical reading aperture disposed between said spaced magnetic reluctance apertures,

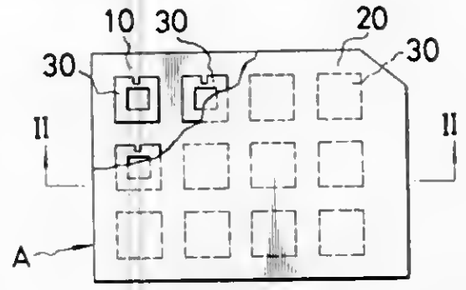
optical means including means for directing radiant energy along an optical path which extends through at least one of said pole pieces and through said optical reading aperture, and

radiant energy sensing means for providing signals in response to exposure to said radiant energy under predetermined conditions.

4,029,945
CARD AND CARD READER APPARATUS THEREFOR

Siyouhachi Yamada, Machida, and Reigi Nakatsubo, Tokyo, both of Japan, assignors to Stanley Electric Co., Ltd., Tokyo, Japan

Filed Aug. 27, 1975, Ser. No. 608,269
Int. Cl.² G06K *7/08, 19/06*
U.S. Cl. 235—61.12 N **13 Claims**



1. A card for storing encoded information, comprising:

a first opaque, non-magnetic sheet having a fixed form;

at least one closed-loop code storing medium of conductive material disposed at a given position on said first opaque sheet and having a constricted portion at a portion of the loop thereof, the surfaces of said at least one closed-loop storing medium being divided into at least two portions, each portion bordering the respective constricted portions thereof;

at least one open-loop code storing medium of conductive material and having substantially the same general shape as said at least one closed-loop code storing medium and cut at the constricted portion thereof, the surfaces of said at least one closed-loop code storing medium being divided into at least two portions, each portion bordering the respective constricted portion thereof; and

a second opaque, non-magnetic sheet covering said closed-loop and open-loop code storing mediums and being adhered at least to said first sheet with said code storing mediums interposed and sealed between said first and second opaque sheets;

one of said portions on one side of at least one of said code storing mediums being adhered to said first opaque sheet, and the opposite surface of the other of said portions thereof being adhered to said second opaque sheet, whereby said at least one of said code storing mediums is broken at the respective constricted portions when said first and second opaque sheets are pulled apart.

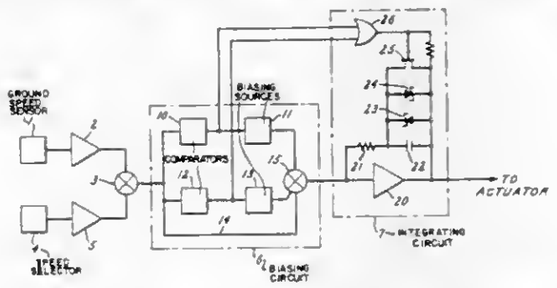
SPEED CONTROL DEVICE FOR MOVING OBJECTS

Milton I. Gerstine, Wilmington, Del.; Setsuo Futatsugi, Kogamigahara; Kazuo Ueda, Kogamigahara; Ryozo Seo, Kogamigahara; Koji Iwasaki, Kogamigahara, and Makoto Uemura, Kogamigahara, all of Japan, assignors to The Boeing Company, Seattle, Wash. and Kawasaki Jukogyo Kabushiki Kaisha, Kobe, Japan

Filed Nov. 24, 1975, Ser. No. 634,384
Claims priority, application Japan, Nov. 22, 1974, 49-134514
Int. Cl.² G06G *7/78*
U.S. Cl. 235—150.2 **5 Claims**

1. A speed control device for moving objects comprising speed detecting means for detecting the actual speed of a moving object and generating a speed signal, speed setting means for generating a set speed signal corresponding to a desired set speed, adding means receiving said actual speed signal and said set speed signal and generating a difference signal corresponding to the difference therebetween, biasing circuit means for adding a bias signal to said difference signal when said difference signal exceeds a predetermined value, resulting thereby in a control signal, and integrating circuit means including means for receiving said control signal and outputting said control signal unaltered, and additional means which together with said means for receiving serve to integrate said difference signal when said difference signal is below said

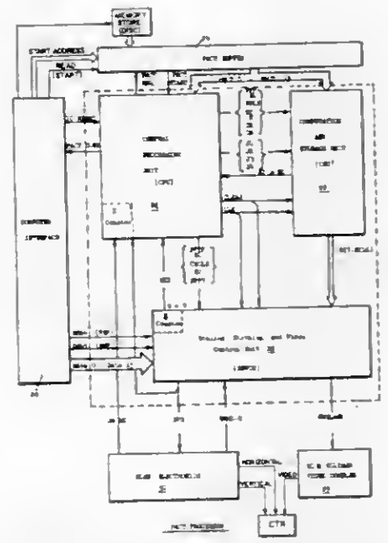


predetermined value, whereby speed control of the moving object is performed by the control signal and the difference signal.

4,029,947
CHARACTER GENERATING METHOD AND SYSTEM

Gregory W. Evans, Santa Ana, and Robert L. Caswell, Placentia, both of Calif., assignors to Rockwell International Corporation, El Segundo, Calif.

Filed May 11, 1973, Ser. No. 359,591
Int. Cl.² G06F *3/14*
U.S. Cl. 235—151 **47 Claims**



1. A character generator for generating characters encoded in accordance with a normalized quad of X Y coordinates wherein each successive X coordinate value corresponds to a computation cycle, each character being encoded in a succession of data instructions related to outlines of the character segments and including a beginning line instruction identifying the initial Y coordinate of each of a related pair of outlines, outline change instructions specifying variously fixed and variable directions of outline, and termination of an outline pair, and an instruction designating the end of a character, each change instruction including an identification of the outline to which it relates, and a number designating the computation cycles to a subsequent instruction,

means responsive to a beginning line instruction to identify an initial pair of outlines and to store in relation thereto their respective Y coordinates,

means responsive to a change instruction for a related outline, as identified and stored, for computing, in each successive computation cycle, a new Y coordinate value for each identified outline in accordance with its associated change instruction, said means maintaining a stored Y coordinate value for an outline for which there is no change instruction,

means for updating the Y coordinate values in said storing means in accordance with the computed new value thereof, as computed in each computation cycle, and

means responsive to the encoded computation cycle number of each successive change instruction to request and receive the next successive instruction for the character upon completion of the encoded number of computation cycles of a present instruction.

RADIOGRAPHY

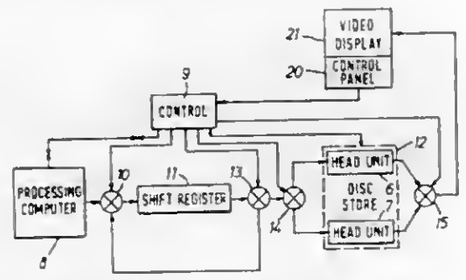
Godfrey Newbold Hounsfield, Newark, England, assignor to E M I Limited, Hayes, England

Filed July 10, 1975, Ser. No. 594,786

Claims priority, application United Kingdom, July 11, 1974, 30712/74

Int. Cl.² G01N *23/06*; **G01T** *1/166*

U.S. Cl. 235—151.3 **5 Claims**



1. Apparatus for displaying a representation of body sections for use, for example, in diagnostic X-ray apparatus including storage means for storing data signals representing the absorption coefficient of elements of two-dimensional spaced arrays of elements notionally delineated in respective spaced cross-sections of the body, means providing weighting functions, means for weighting data for corresponding elements of said first mentioned arrays with appropriate weighting functions to provide interpolated data signals according to predetermined interpolating functions said interpolated data signals representing coefficients for corresponding elements of another array of elements notionally delineated in another cross-section of said body intermediate the first mentioned body section and means for displaying a repesentation of any of said body sections.

4,029,949

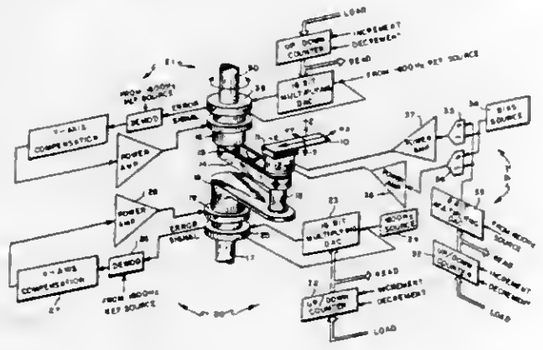
SERVO-CONTROLLED MICROSCOPE STAGE

Brock S. Dew, Newton, Mass., assignor to The Charles Stark Draper Laboratory, Inc., Cambridge, Mass.

Filed July 8, 1975, Ser. No. 593,999

Int. Cl.² G06J *1/00*; **G05B** *19/42, 19/34*

U.S. Cl. 235—151.11 **9 Claims**



1. An apparatus for controlling the position of a movable element comprising

means for holding said movable element, said holding means being capable of movement in at least two substantially orthogonal directions;

first and second positioning means for moving said holding means along first and second ones of said at least two orthogonal directions, respectively, each of said first and second means comprising

means for supplying a digital command signal representing a selected position along an arcuate path substantially corresponding to one of said at least two orthogonal directions;

means for providing a reference signal;

a high resolution digital-to-analog converter means responsive to said digital position command signal and to said reference signal for converting said digital position command signal to an analog position command signal, and

servo control means responsive to said analog position command signal and to said reference signal for directly moving said holding means along said arcuate path to said selected position.

4,029,950

NUMERICAL CONTROL SYSTEM FOR MACHINES UTILIZING A PROGRAMMABLE SEQUENCE CONTROLLER

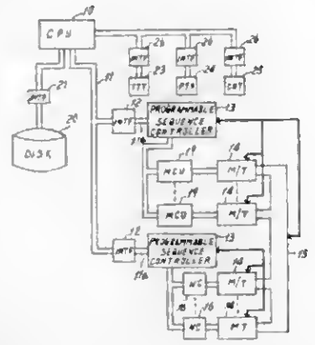
Kyosuke Haga, Anjo, Japan, assignor to Toyoda-Koki Kabushiki Kaisha, Japan

Filed Apr. 22, 1976, Ser. No. 679,450

Claims priority, application Japan, May 9, 1975, 50-55791

Int. Cl.² G05B *19/28*

U.S. Cl. 235—151.11 **20 Claims**



1. A machine control system comprising in combination;

a plurality of numerically controlled machines;

a plurality of machine controllers respectively connected with said machines for controlling the operations of said machines in accordance with numerical control data;

a digital computer provided with a memory device for storing said numerical control data and adapted to convert each of the least units of said numerical control data to a predetermined number of set and reset commands;

a programmable sequence controller comprising:

a. an input-output circuit provided with a plurality of addressable input and output terminals, a predetermined number of said output terminals being addressed respectively to data input terminals of said machine controllers,

b. a program memory device for containing a predetermined sequence control program,

c. register means connected with said digital computer for receiving from said digital computer said set and reset commands along with address codes designating said predetermining number of said terminals, and

d. a logic control circuit adapted to set or reset one of said output terminals as a result of examining the signal conditions of said input terminals in accordance with said sequence control program and to set or reset said output terminals addressed to said data input terminals when said set and reset commands and said address codes are supplied from said register means, whereby said programmable sequence controller is operable as a data transmitter for said numerical control data between said digital computer and said machine controllers.

4,029,951

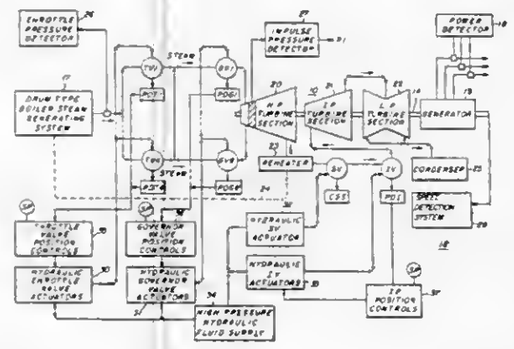
TURBINE POWER PLANT AUTOMATIC CONTROL SYSTEM

William R. Berry, Camden; Charles L. Groves, Jr., Willingboro, both of N.J., and Eddie Y. Hwang, Wallingford, Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Oct. 21, 1975, Ser. No. 625,625

Int. Cl.² F01D *19/00*

U.S. Cl. 235—151.21 **16 Claims**



1. An electric power generating system, comprising:

a steam turbine having a high pressure section and a reheat turbine section;

an electric generator rotated by said turbine to produce electric power when connected to a load;

steam inlet valve means to govern the flow of steam to the turbine;

means to detect the temperature of the steam at predetermined locations within the steam turbine;

means to detect the temperature of stationary turbine metallic parts at predetermined locations within the steam turbine;

means governed by the detection means to generate data relating to thermal stress of the high pressure and reheat turbine rotors;

means governed by the detection means to generate data relating to temperature adjacent the axis of the reheat turbine rotor;

means to generate a signal governing the acceleration of the turbine in accordance with the generated data relating to thermal stress;

means governed by the generated data relating to the reheat rotor temperature to generate a signal governing the turbine to hold its speed at a predetermined speed at times when the generated data relating to the reheat temperature is below a predetermined value irrespective of the generated data relating to thermal stress; and

means governed by the generated hold signal and the acceleration rate signal to control the steam inlet valves to govern the flow of steam to the turbine.

4,029,952

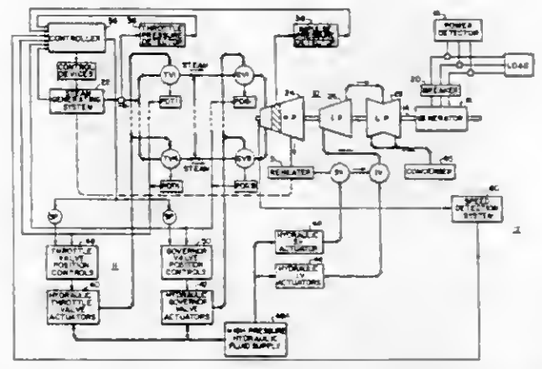
ELECTRIC POWER PLANT HAVING A MULTIPLE COMPUTER SYSTEM FOR REDUNDANT CONTROL OF TURBINE AND STEAM GENERATOR OPERATION

Theodore C. Giras, Pittsburgh; William E. Mendez, Jr., Murrysville, and Jack R. Smith, Pittsburgh, all of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Nov. 6, 1973, Ser. No. 413,275

Int. Cl.² F01D *17/02*; **G05B** *15/00*; **G06F** *15/06*

U.S. Cl. 235—151.21 **32 Claims**



1. A control system for an electric power plant having at least one steam turbine and a steam generator, said control system comprising multiple digital computers including at least a first digital computer and a second digital computer, means for generating input signals representing predetermined process variables associated with said steam generator, means for generating input signals representing predetermined process variables associated with said steam turbine, means for coupling the input signals to both of said computers, each of said computers including means for sequentially controlling its programmed operation and substantially identical means for generating control outputs for operating controllable elements of said steam generator and throttle and governor valves of said steam turbine as a function of the input signals, means for sensing predetermined control system malfunctions, means for coupling the outputs of one of said computers to operate the steam generator controllable elements and turbine valves, means for substantially conforming the structure of the other computer to the structure of said one computer in real time including means for generating control outputs in the other computer substantially equal to those from said one computer, means for generating in said other computer representations of predetermined variables stored in said one computer and normally undetectable from the control outputs of said one computer and subject to change as a result of internal operations of said one computer or as a result of responses to input signals entered only into said one computer even though such signals normally are entered into both computers, and means for executing a transfer in the control of the steam generator and the turbine from said one computer to said other computer substantially without disturbing the power generation when said sensing means detects a control system malfunction.

4,029,953

TWIST-LOCK LAMP SOCKET LOCKING MEANS

Richard A. Natoli, Girard, Ohio, assignor to General Motors Corporation, Detroit, Mich.

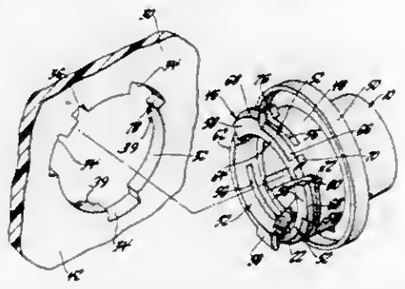
Filed Sept. 22, 1975, Ser. No. 615,236

Int. Cl.² B60Q *3/04*; **F21V** *21/08*; **H02B** *1/02*

U.S. Cl. 240—8.16 **3 Claims**

1. A lamp socket assembly comprising a socket support panel having a socket opening therein with a plurality of circumferentially spaced, radially outwardly directed retention slots, a socket having a plurality of circumferentially spaced integrally formed cantilevered beams formed on one end thereof, each of said beams having a root potion secured to said socket and a circumferentially directed arcuate seg-

ment extending from said root portion and being longitudinally flexible with respect to said socket, each of said beams including a radially outwardly directed surface congruent to said retention slots for guided axial alignment therewith, said beams being freely axially movable in guided relationship with respect to said slots for locating said socket on said panel, each of said beams having a free end portion thereon with a ramp formed thereon, first coacting means on said panel and said ramps for causing said free end portions to flex across and



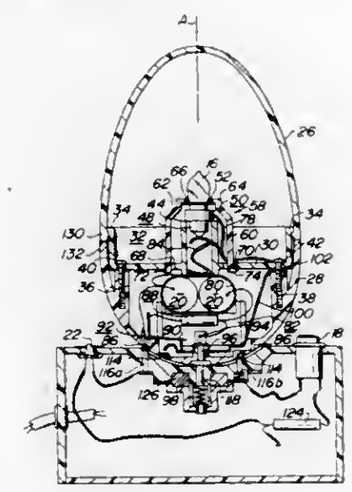
engage said panel to audibly indicate rotation of said socket from its axially inserted position within said panel to a retained position wherein said free end portions are arcuately shifted out of axial alignment with said slots, second coacting means on said socket and said panel to establish a rotatably indexed position of said socket with respect to said panel, said beams applying an axial retention bias between said socket and said panel when in the indexed position thereby to tightly hold said socket against vibrations with respect to said panel.

4,029,954

PORTABLE LAMP

John N. Moyer, Penns Park, Pa., assignor to HMS Associates, Inc., Willow Grove, Pa.

Filed Nov. 10, 1975, Ser. No. 630,233
Int. Cl.² F21L 7/00
U.S. Cl. 240—10.6 CH 15 Claims



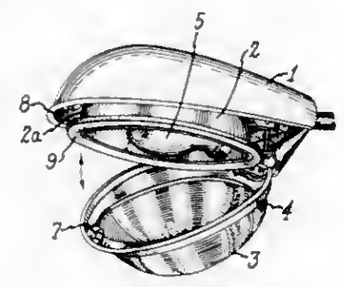
1. A portable lamp, comprising:
a lamp enclosure;
a base for supporting said lamp enclosure, said base including a plug connectable to a power source;
a lamp and one or more batteries connected thereto within said lamp enclosure;
means for recharging said batteries when said lamp enclosure is mounted on said base at an angular orientation about an axis transverse to said base; and
means for automatically energizing said lamp when said lamp enclosure is removed from said base independently of the connection of a power source to said plug.

4,029,955

LUMINAIRE FILTER MATERIAL

David K. Tart, Lenox, Mass., assignor to General Electric Company, New York, N.Y.

Division of Ser. No. 440,698, Feb. 8, 1974, abandoned. This application May 9, 1975, Ser. No. 575,991
Int. Cl.² F21S 13/10; B01D 39/00
U.S. Cl. 240—25 4 Claims



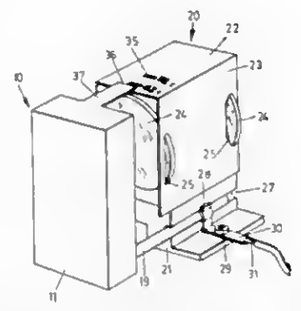
1. In a luminaire, an optical system comprising a reflector and a light transmitting closure defining a closed optical enclosure, means for mounting a lamp in said enclosure, and air-permeable, gas adsorbent filter means arranged on said optical enclosure communicating with the interior thereof for filtering air passing thereinto by removal of solid and gas impurities contained in the air, said filter means comprising a compressible composite felt comprising intermingled first and second fiber materials, said first fiber material composed of a high temperature resistant material, and said second fiber material comprising an organic material and being substantially carbonized, whereby said composite felt is adsorptive of gaseous and particulate contaminants in the air.

4,029,956

LIGHT FIXTURE FOR PROJECTION DEVICE

Max Leibundgut, Wadenswil, and Tony Reber, Zurich, both of Switzerland, assignors to Alos AG, Zurich, Switzerland

Filed Mar. 24, 1976, Ser. No. 670,021
Claims priority, application Switzerland, Mar. 24, 1975, 3714/75
Int. Cl.² F21V 7/09
U.S. Cl. 240—41.37 6 Claims



1. A light fixture for projection devices, including an electric light bulb serving as a light source, a bulb socket for holding and providing an electrical connection of the light bulb, a concave mirror serving as a reflector, and an optical condenser system including a condenser unit having an electric terminal, whereby the bulb socket and the concave mirror are combined into a first constructional unit, hereinafter referred to as a lamp unit, that is detachably connected with a second constructional unit containing the optical condenser system, and whereby the bulb is movable for the purpose of centering its filament coil in relation to the concave mirror, and the condenser unit is designed for stationary mounting in a projection device, while the lamp unit is only supported by the condenser unit, characterized in that connecting elements are provided to effect a mechanical connection of the lamp unit to the condenser unit as well as to effect an electrical

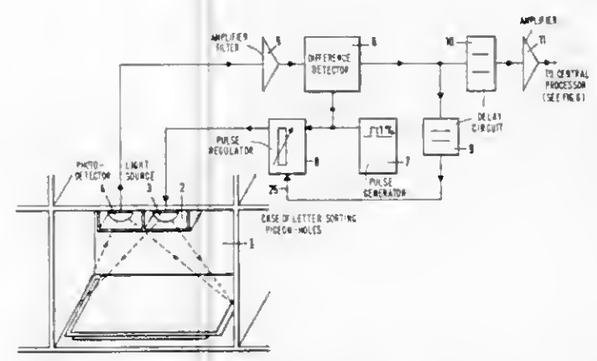
connection between the bulb socket of the lamp unit and the terminal in the condenser unit, the connecting elements being secured to one of the two constructional units and extending parallel to the optical axis of the light fixture, the other of the constructional units having guide grooves with which the connecting elements engage, and sliding contact elements on the other of the constructional units in contact with the connecting elements, whereby the connection elements are sufficiently long that the lamp unit can be adjusted as desired at various distances from the optical condenser system in the condenser unit, thereby making it possible to adjust the light fixture to various lens focal lengths of the projection device.

4,029,957

DETECTION DEVICE

Frans Betz; Jacobus Johannes de Haas, both of Leidschendam, and Petrus Cornelis van der Kraan, Zoetermeer, all of Netherlands, assignors to De Staat der Nederlanden, te Dezen Vertegenwoordigd Door de Directeur-Generaal der Posterijen, Telegrafie en Telefonie, The Hague, Netherlands

Filed Oct. 8, 1975, Ser. No. 620,638
Claims priority, application Netherlands, Oct. 9, 1974, 7413282
Int. Cl.² G01D 21/04
U.S. Cl. 250—221 16 Claims



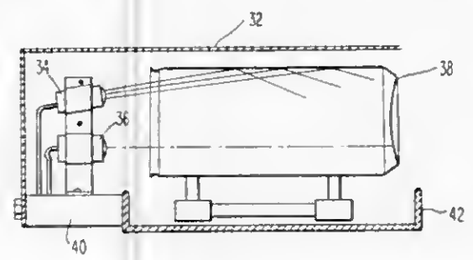
1. Detection device for detecting movements by means of a source of light and a photo-detector, characterized by a pulse generator for repeatedly supplying the source of light with energy to light it during a relatively short period of time compared to the time between repetitions of pulses from said generator, and by a comparator, synchronized with said pulse generator and connected to said photo-detector responsive to light from said light source for comparing each signal received from the photo-detector with the preceding signal received therefrom during the said time and for producing a third signal in case there is a difference between said received signal and said preceding signal.

4,029,958

APPARATUS FOR INSPECTING CONTAINERS

George W. Wright, Willingboro, N.J., assignor to Crown Cork & Seal Company, Inc., Philadelphia, Pa.

Filed July 25, 1975, Ser. No. 599,070
Int. Cl.² B07C 5/344; G01D 21/004
U.S. Cl. 250—223 B 12 Claims



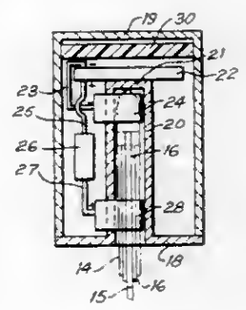
1. Inspection apparatus for detecting the substantial absence of a coating within a cylindrical metal container having one closed axial end, comprising:
means for transporting containers to be inspected along a path;
a source of substantially diffuse light disposed adjacent said path for directing diffused light toward a locus upon the cylindrical sidewall of a container to be inspected;
photosensor means disposed adjacent said path and adjacent said light source, said photosensor being directed axially within and toward the closed end of said container and outputting a signal indicative of a substantial absence of coating upon the total inner surface area of said container; and
discharge means coupled to said photosensor means and responsive to said signal for discharging said container from said path.

4,029,959

PLANT LIGHT SENSOR ADAPTOR

Hugh Cottingham, Upper Montclair, and Joseph Scrocco, West Orange, both of N.J., assignors to BHN, Inc., Upper Montclair, N.J.

Filed Feb. 13, 1976, Ser. No. 658,140
Int. Cl.² H01J 5/02, 39/12
U.S. Cl. 250—239 7 Claims



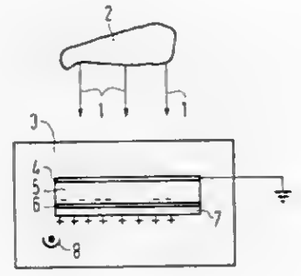
1. A plant light sensor adaptor for use with moisture monitoring means having a coaxially formed probe including first and second metal eletrode means, and indicating means for sensing and indicating current flow due to electro-galvanic response produced by the difference in the redox potential in the first and second metal electrode means, said current flow being controlled by the moisture content of the substrate material under test, comprising in combination, a reference member including receiving means for receiving said probe, said receiving means including first and second spaced apart electrically isolated contact means, said receiving means being configured to dispose said probe at a predetermined position to dispose said first and second contact means in electrical contact with said first and second metal electrode means when said probe is inserted into said receiving means, and photosensitive means coupled to said respective first and second spaced apart electrically isolated contact means, said photosensitive means being adapted to detect the luminous flux incident thereon, and in response thereto apply through said respective first contact and metal electrode means and through said respective second contact and metal electrode means a current signal representative of the luminous flux whereby said indicating means senses and indicates the luminous flux detected by the photosensitive means.

4,029,960

DEVICE FOR THE RECORDING AND REPRODUCTION OF X-RAY PICTURES

Dietlind Pekau, Taufkirchen, and Eckhard Storck, Munich, both of Germany, assignors to Siemens Aktiengesellschaft, Berlin & Munich, Germany

Filed Sept. 4, 1975, Ser. No. 610,161
Claims priority, application Germany, Sept. 6, 1974, 2442808
Int. Cl.² G03G 13/00, 15/00
U.S. Cl. 250—315 R 9 Claims



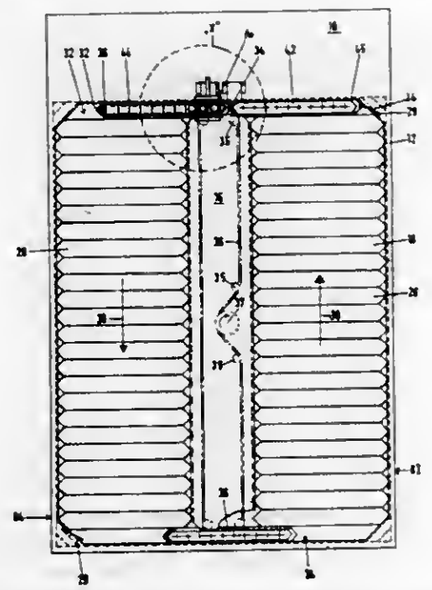
1. In a device for the recording and reproduction of X-ray pictures, the combination of a layer of amorphous selenium disposed in a housing, the selenium layer being carried by a thermoplastic disposed at one side of the selenium layer, an electrode disposed at the other side of the selenium layer on the free surface thereof, at which side the X-rays impact the device, an additional dielectric layer disposed between said selenium layer and said thermoplastic layer, forming a dielectric reflector, and a movable corona-charge electrode disposed adjacent the thermoplastic layer for charging the free surface of the latter.

4,029,961

APPARATUS FOR MEASURING THE NUCLEAR RADIATION OF A SEQUENCE OF RADIOACTIVE SAMPLES

Wilhelm Lohr, Reichertsklinge 11, D-7547 Wildbad; Fritz Berthold, Engelsbrander Strasse 12, D-754 Neuenburg, both of Germany, and Robert W. Allington, 1551 Ridgeway Road, Lincoln, Nebr. 68522

Filed Apr. 11, 1975, Ser. No. 567,436
Int. Cl.² G01T 1/00
U.S. Cl. 250—328 26 Claims



1. An apparatus for measuring the nuclear radiation of a sequence of radioactive samples in sample containers which are held in groups with each group held in a different magazine comprising:

a measuring station having a working place and a measuring place;

transporting means for moving the magazines in a horizontal direction and placing the sample containers in said magazines one-at-a-time at a working place;

said measuring station including means for measuring the nuclear radiation in said measuring place;

said measuring place vertically displaced below the working place;

transfer means for conveying the sample container in a magazine at the working place to the measuring place and returning it to the magazine at the working place after the nuclear radiation of the sample in the sample container has been measured;

each of said magazines including a receiving means for holding and releasing each individual sample container in the magazine; and

control means for operating the receiving means to release a sample container when the sample container is at the working place

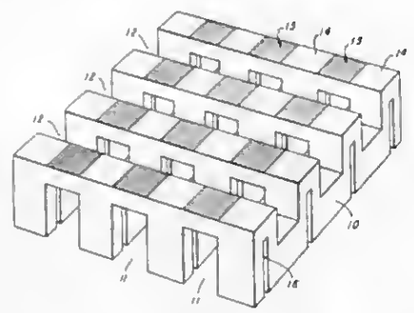
---

4,029,962

ARRAYS FOR INFRARED IMAGE DETECTION

Richard Alexander Chapman, Dallas, Tex., assignor to Texas Instruments Incorporated, Dallas, Tex.

Filed June 23, 1975, Ser. No. 589,104
Int. Cl.² G01J 1/00
U.S. Cl. 250—338 21 Claims



1. A monolithic infrared detector array comprising:

a block of monocrystalline semiconductor material taken from the group consisting of silicon and germanium, said block of semiconductor material being doped with an infrared-sensitive conductivity-determining impurity and having first and second pluralities of parallel slots respectively formed in the opposite major surfaces thereof,

said first plurality of parallel slots formed in one major surface of said semiconductor block being orthogonally related to said second plurality of parallel slots formed in the other major surface of said semiconductor block,

a third plurality of parallel slots formed in said other major surface of said semiconductor block, said third plurality of parallel slots being parallel to said first plurality of parallel slots formed in said one major surface of said semiconductor block and being orthogonally related to and intersecting with said second plurality of parallel slots formed in said other major surface thereof,

said third plurality of parallel slots defining respective holes extending into the semiconductor material of said semiconductor block from said other major surface thereof toward said one major surface thereof,

a patterned metal layer opaque to infrared radiation overlying said one major surface of said semiconductor block and including a plurality of interrupted metal strips extending over the semiconductor material of said semiconductor block between successive slots formed therein;

a plurality of semiconductor regions of said one major surface of said semiconductor block including exposed areas arranged in a plurality of linear rows across said plurality of metal strips and forming the interruptions therein,

the exposed areas of said plurality of semiconductor regions communicating with respective portions of said semiconductor block disposed therebeneath and defining active infrared detector areas, said active infrared detector areas respectively including said holes as defined by said third plurality of parallel slots formed in said other major surface of said semiconductor block,

said plurality of semiconductor regions respectively including portions thereof contacting the metal strip segments on opposite sides of the exposed areas of said plurality of semiconductor regions,

insulation means interposed between the remaining portions of said patterned metal layer and said one major surface of said semiconductor block, and

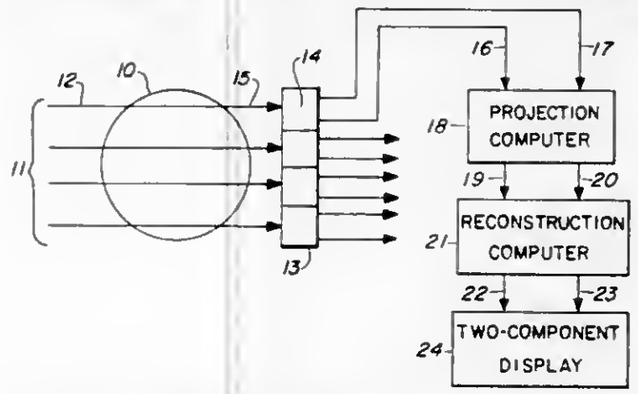
means associated with said holes providing electrically conductive areas in communication with said active infrared detector areas and said other major surface of said semiconductor block.

4,029,963

X-RAY SPECTRAL DECOMPOSITION IMAGING SYSTEM

Robert E. Alvarez, Stanford, and Albert Macovski, Palo Alto, both of Calif., assignors to The Board of Trustees of Leland Stanford Junior University, Stanford, Calif.

Filed July 30, 1976, Ser. No. 710,359
Int. Cl.² A61B 6/02; G01N 23/08; H05G 1/30
U.S. Cl. 250—360 22 Claims



1. Apparatus for providing energy-dependent x-ray images of an object comprising:

an x-ray source positioned on one side of the object producing an x-ray beam which transverses the object;

an x-ray detector positioned on the side of the object opposite that of the source;

means for measuring the x-ray transmission through the object, with the x-ray detector, at the lower and higher energy regions of the diagnostic x-ray spectrum and producing a low-energy projection signal and a high-energy projection signal;

computational means for processing the low-energy projection signal and the high-energy projection signal and producing an atomic-number-dependent signal which is substantially on the line integral of the atomic number of the object raised to a power, and a density-dependent signal which is substantially dependent on the line integral of the density of the object; and

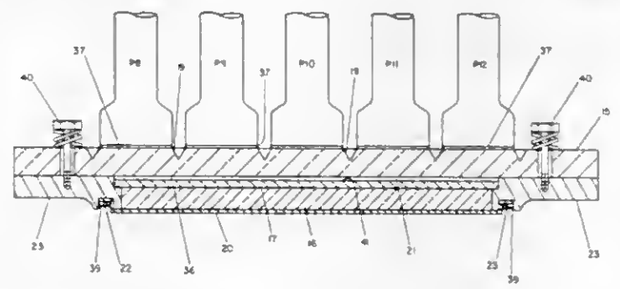
means for utilizing a plurality of the atomic-number-dependent signal and a plurality of the density-dependent signal to produce energy-dependent x-ray images of the object.

4,029,964

DETECTOR CONSTRUCTION FOR A SCINTILLATION CAMERA

John B. Ashe, Palatine, Ill., assignor to G. D. Searle & Co., Skokie, Ill.

Filed Aug. 11, 1975, Ser. No. 603,377
Int. Cl.² G01T 1/20
U.S. Cl. 250—368 13 Claims



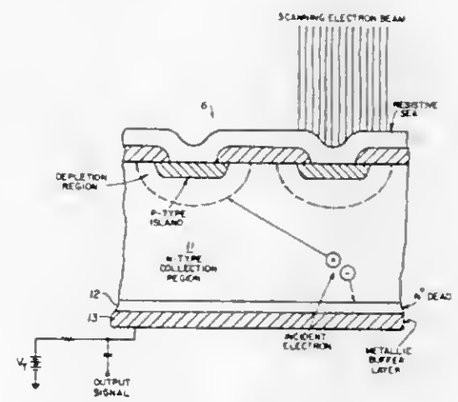
1. In a scintillation camera for radioisotope imaging employing a laminar scintillation crystal, an array of photodetectors in optical communication with said scintillation crystal for generating electrical signals providing position information with regard to scintillations occurring in said scintillation crystal in response to incident gamma radiation wherein each photodetector views an overlapping portion of said scintillation crystal, a transparent light conducting element interposed between said scintillation crystal and said array of photodetectors, electrical circuitry connected to said photodetectors for receiving the aforesaid electrical signals from said photodetectors and for producing composite image signals, and an image representation means for receiving said image signals and depicting signals for a single detected radioactive event as positional coordinates of interaction of said event with the aforesaid crystal, the improvement comprising a laminar moisture-impermeable barrier less than one quarter inch in thickness interposed between said scintillation crystal and said light conducting element.

4,029,965

VARIABLE GAIN X-RAY IMAGE INTENSIFIER TUBE

Allan Ivan Carlson, Ossining, and Barry M. Singer, New York, both of N.Y., assignors to North American Philips Corporation, New York, N.Y.

Continuation-in-part of Ser. No. 550,362, Feb. 18, 1975, abandoned. This application Feb. 23, 1976, Ser. No. 660,728
Int. Cl.² G01T 1/22
U.S. Cl. 250—370 7 Claims



1. A electron sensitive silicon diode array target for use in an X-ray image intensifier tube having an electron scanning beam read-out and a predetermined range of photocathode voltages, an n-type single crystalline silicon substrate with a plurality of p-type islands on the side of the substrate that is

scanned with the electron read-out beam; a resistive film covering the plurality of p-type islands; a deep n^+ dead layer on the side of the substrate that receives the high energy incident electrons; a metallic buffer layer deposited on the n^+ dead layer, the combined thickness of said n^+ dead layer and said buffer layer being adjusted for providing target gain in said range of photocathode voltages, which is required for the X-ray image intensifier tube, and combined thickness of the n^+ dead layer and the metallic buffer layer being adjusted for providing a target gain which ranges from unity to about 300 at photocathode voltages from about −19 kv to −26 kv, respectively.

4,029,966

RADIATION-DETECTING DEVICES AND APPARATUS

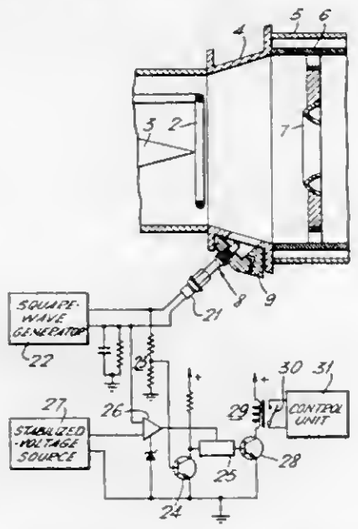
Peter D. Baker, and Denys V. Hollands, both of Basingstoke, England, assignors to Smiths Industries Limited, London, England

Filed May 21, 1975, Ser. No. 579,651

Claims priority, application United Kingdom, May 21, 1974, 22551/74

Int. Cl.² G01J *1/42*

U.S. Cl. 250—372 **14 Claims**



12. Flame-monitoring apparatus comprising means for sensing ultra-violent radiation, a filter mounted in front of said sensing means to limit substantially passage of infra-red radiation to said sensing means, means for interrogating said sensing means repeatedly to determine at each interrogation whether in accordance with the response of said sensing means a predetermined flame-condition exists, said flame-condition being related to the level of ultra-violent radiation received by said sensing means and said interrogating means including signal means to generate a predetermined signal whenever the said flame-condition is determined to exist at any said interrogation of said sensing means, resettable counting means, means coupled to said counting means to provide a predetermined response when the count of said counting means exceeds a predetermined value, means for advancing the count of said counting means stepwise towards said value upon each successive interrogation of said sensing means, and means coupled to said signal means to reset (for resetting) the said counting means in response to generation of said predetermined signal (whenever) during (the successive) interrogation of said sensing means (said predetermined flame-condition is determined to exist).

4,029,967

DEVICE FOR THE UNIFORM IRRADIATION OF GOODS BY MEANS OF ELECTRO-MAGNETIC RADIATION

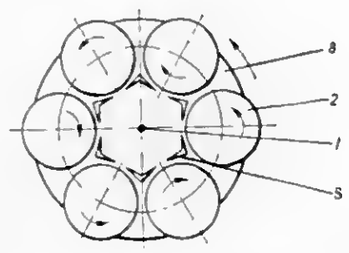
Karl-Heinz Tetzlaff, No. 3, Morikestrasse, Kelkheim, Germany

Filed Nov. 22, 1974, Ser. No. 526,187

Claims priority, application Germany, Nov. 24, 1973, 2358652

Int. Cl.² A61K *27/02*

U.S. Cl. 250—492 R **9 Claims**



1. An irradiation device for the uniform irradiation of goods by means of electro-magnetic radiation having a quantum energy larger than 5 KeV, comprising:

a. at least one radiation source,

b. means spaced from the radiation source for receiving goods to be irradiated, said goods having a center axis,

c. a radiation path extending from the radiation source to the center axis of the goods,

d. at least one shielding element laterally disposed with respect to the radiation path to provide a shielding effect that increases with increasing lateral space from the radiation path,

e. the shielding element and the receiving means for the goods being arranged with respect to each other to allow for the radiation to enter the goods through the entire superficies thereof in such a way that the region immediately around the center axis of the goods is irradiated with radiation unaffected by the shielding element.

4,029,968

STACKED RACKS FOR STORING SPENT NUCLEAR FUEL ELEMENTS

Herbert J. Rubinstein, Los Gatos, and James D. Gilcrest, San Jose, both of Calif., assignors to Nuclear Services Corporation, Campbell, Calif.

Filed Sept. 11, 1975, Ser. No. 612,533

Int. Cl.² G21F *5/00*

U.S. Cl. 250—507 **6 Claims**

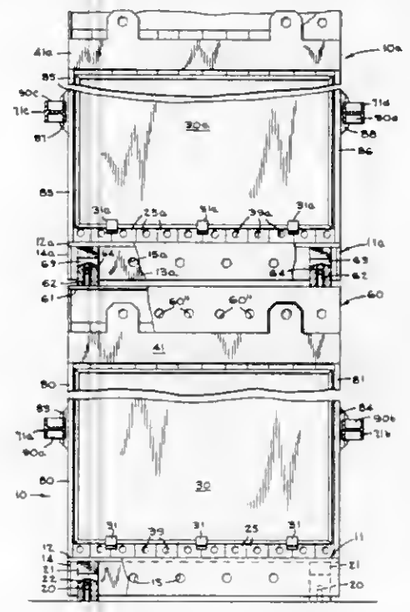
1. In combination:

a. a first rack for storing a plurality of nuclear fuel elements;

b. a second rack for storing a plurality of nuclear fuel elements, said second rack being disposed above said first rack; and

c. first means including a frame-like support engaging said first and second racks for removably retaining said first and second racks in a predetermined position,

d. said first and second racks including oppositely directed first members engaging said frame-like support for removably retaining said first and second racks in the predetermined position, said frame-like support including parallel second members engaged respectively by said first members for removably retaining said first and second racks in the predetermined position.



4,029,969

METHOD AND DEVICE FOR SUPPRESSING NOISE RADIO WAVES IN MOTOR VEHICLE HAVING IGNITION TYPE ENGINE

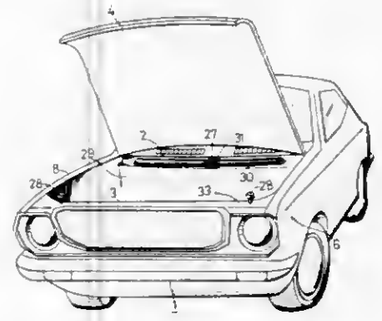
Hiroshi Kondo; Isamu Murata, and Teruo Yamanaka, all of Toyoda, Japan, assignors to Toyota Jidosha Kogyo Kabushiki Kaisha, Toyoda, Japan

Filed June 17, 1975, Ser. No. 587,553

Claims priority, application Japan, Sept. 14, 1974, 49-106187

Int. Cl.² H02G *3/00*

U.S. Cl. 307—10 R **12 Claims**



1. A method of suppressing noise radio waves in a motor vehicle, comprising the steps of: determining the positions of interstices defined between

surface defining members of the body of said vehicle which exhibit a minimum quantity of the magnetic fluxes of said noise radio waves leaking through said interstices, said members being located in the neighborhood of a noise radio wave generating source, such an an engine mounted on said motor vehicle; and

bonding together said surface defining members which oppose each other through said interstices at said positions which exhibit said minimum quantity of magnetic fluxes.

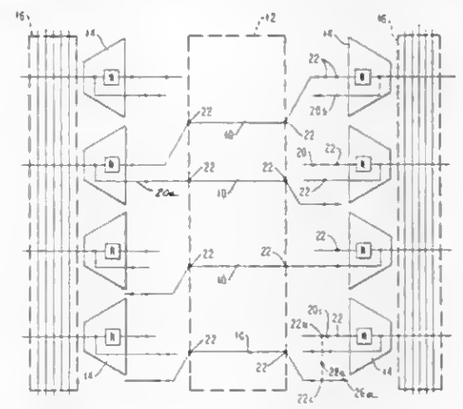
CHANGEABLE DECODER STRUCTURE FOR A FOLDED LOGIC ARRAY

Se J. Hong, and Daniel L. Ostapko, both of Poughkeepsie, N.Y., assignors to IBM Corporation, Armonk, N.Y.

Filed Nov. 6, 1975, Ser. No. 629,259

Int. Cl.² H03K *19/20*; **G06F** *9/00*; **H03K** *13/00*

U.S. Cl. 307—207 **3 Claims**



1. In a programmable logic array of the type comprising at least two arrays in which one of the arrays receives binary input variables on its input lines from decoders that generate those input variables from binary input signals and feeds the responses thereto on its output lines to a second array, an arrangement for driving a plurality of groups of four input lines of the first array at both ends to provide on the input lines all possible combinations of at least three input signals comprising:

two sets of one-bit decoders positioned on each side of the first array adjacent to each group of four input lines,

selective input means coupled to the inputs of the decoders for supplying at least one input signal to the inputs of sets of decoders serving one side of at least two groups of four unsegmented input lines and supplying two input variables to the inputs of sets of decoders serving the other side of said at least two groups of input lines,

selective output means coupling the outputs of one-bit decoders from the two sets to said groups of input lines of the first array for selectively placing three or more outputs from said one-bit decoders positioned on both sides of the first array on various ones of the input lines in said groups of at least two groups of input lines so that those three or more outputs of the decoders are dot ORd on the various ones of the input lines whereby three and four-bit decoding using two or more groups of input lines is accomplished.

4,029,971

TRI-STATE LOGIC CIRCUIT

Richard Lee Pryor, Voorhees, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Feb. 13, 1976, Ser. No. 657,838

Int. Cl.² H03K *1/00*, *19/08*

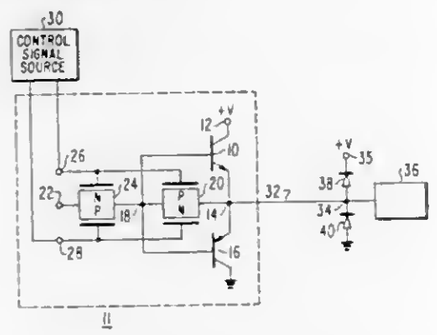
U.S. Cl. 307—209 **7 Claims**

1. An amplifying circuit comprising, in combination:

first and second amplifiers, each amplifier having an input and an output terminal and a relatively high input impedance, said first and second amplifier input terminals interconnected and coupled to a circuit input terminal to which an input signal may be applied and said first and second amplifier output terminals interconnected and connected to a circuit output terminal;

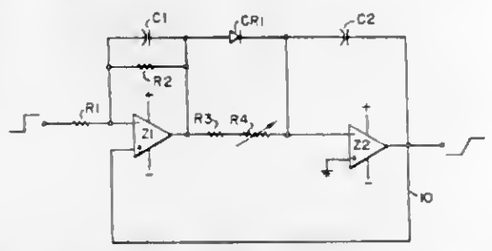
first switching means having an impedance when in its open state very much greater than said relatively high input impedance and when in its closed state very much less than said relatively high input impedance, said first

switching means connected between the interconnected amplifier input terminals and said circuit output terminal;
second switching means connected between said circuit input terminal and the interconnected amplifier input terminals;
means for concurrently closing said first switching means and opening said second switching means and vice-versa;
a transmission line connected at one end to said circuit output terminal;



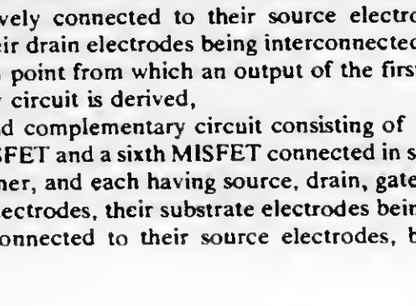
load means connected to the other end of said line, said load means causing a reflected wave to propagate through said line towards said circuit output terminal in response to said output signal when its input impedance does not equal the characteristic impedance of said line; and
means responsive to the instantaneous sum of said output signal and said reflected wave for coupling said line to a point at a first potential whenever said sum is greater than a first predetermined value and to a second potential whenever said sum is less than a second predetermined value.

4,029,972
RAMPING CIRCUIT
David A. Fox, Lima, and James L. Roof, Fort Shawnee, both of Ohio, assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.
Filed Dec. 16, 1975, Ser. No. 641,314
Int. Cl.² H03K *4/08*
U.S. Cl. 307—228 **4 Claims**



I. A ramping circuit comprising:
an input terminal for receiving an input signal that may vary abruptly in magnitude;
a first operational amplifier having positive and negative input terminals and an output terminal, said input terminal being electrically coupled to said negative input terminal of said first operational amplifier;
a second operational amplifier having positive and negative input terminals and an output terminal, said negative input terminal of said second operational amplifier being electrically coupled to said output terminal of said first operational amplifier by a first circuit branch including a resistance and by a second circuit branch, in parallel with said first branch, including a diode rectifier poled to conduct from said first to said second operational amplifier to provide rapid reset of the ramping circuit, said positive input terminal of said second operational amplifier being maintained at a reference potential; and
a feedback circuit branch from said output terminal of said second operational amplifier to said positive input terminal of said first operational amplifier to provide at said output terminal of said second operational amplifier a linear signal gradually changing between levels corresponding to two levels of said input signal and in the same direction as the change in said input signal.

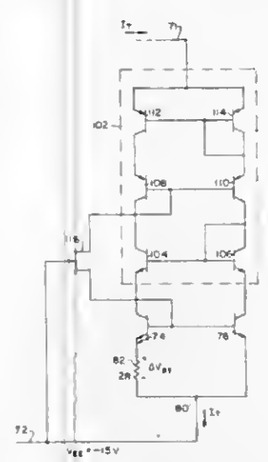
4,029,973
VOLTAGE BOOSTER CIRCUIT USING LEVEL SHIFTER COMPOSED OF TWO COMPLEMENTARY MIS CIRCUITS
Isamu Kobayashi, Tokyo; Osamu Yamashiro; Naoki Yashiki, both of Kodaira, and Tadashi Funakubo, Higashiyamato, all of Japan, assignors to Hitachi, Ltd., Japan
Filed Apr. 6, 1976, Ser. No. 674,084
Claims priority, application Japan, Apr. 21, 1975, 50-47546
Int. Cl.² H03K *1/14, 3/353, 17/60;* **G04C** *3/00*
U.S. Cl. 307—264 **5 Claims**



1. A voltage booster circuit comprising:
a. a terminal for receiving a fixed voltage;
b. a first switching MISFET having source, drain, gate and substrate electrodes, said drain electrode being connected to said terminal for receiving said fixed voltage;
c. a second switching MISFET connected in series with said first switching MISFET and having source, drain, gate and substrate electrode;
the substrate electrode of each of said first MISFET and said second MISFET being connected to the source electrode of the same respective MISFET, the source electrode of said first MISFET and the drain electrode of said second MISFET being connected to each other, said first MISFET and second MISFET being respective switching means of first and second stages;
d. a pulse input terminal;
e. a first inverter circuit and a second inverter circuit connected in cascade with said pulse input terminal;
f. a first capacitor connected between a common connection of said first and second MISFETs and a common connection of said first and second inverter circuits;
g. a second capacitor having one electrode connected with the source electrode of said second MISFET and the other electrode being grounded; and
h. a level converting circuit having a first and a second complementary circuit, said first complementary circuit consisting of
a third MISFET and a fourth MISFET connected in series with each other, and each having source, drain, gate and substrate electrodes, their substrate electrodes being respectively connected to their source electrodes, and both their drain electrodes being interconnected at a first junction point from which an output of the first complementary circuit is derived,
said second complementary circuit consisting of
a fifth MISFET and a sixth MISFET connected in series with each other, and each having source, drain, gate and substrate electrodes, their substrate electrodes being respectively connected to their source electrodes, both their

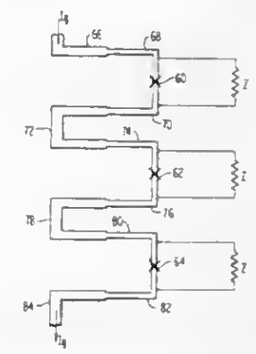
drain electrodes being interconnected at a second junction point from which an output of the second complementary circuit is derived,
said first junction point being connected to gate electrode of said first MISFET and connected to the gate electrode of said fifth MISFET,
said second junction point being connected to the gate electrode of said third MISFET and to the gate electrode of said second MISFET,
the source electrode of said third MISFET being connected to the common connection of said first and second MISFETs,
the source electrode of said fifth MISFET being connected to a common connection of the source electrode of said second MISFET and said one electrode of said second capacitor from which an output of said booster circuit is derived, and
the source electrode of each of said fourth MISFET and sixth MISFET being grounded.

4,029,974
APPARATUS FOR GENERATING A CURRENT VARYING WITH TEMPERATURE
Adrian Paul Brokaw, Burlington, Mass., assignor to Analog Devices, Inc., Norwood, Mass.
Division of Ser. No. 560,954, March 21, 1975, Pat. No. 3,940,760. This application Nov. 13, 1975, Ser. No. 631,844
Int. Cl.² H03K *1/00;* **H01V** *3/00;* **H01L** *35/00*
U.S. Cl. 307—296 R **12 Claims**



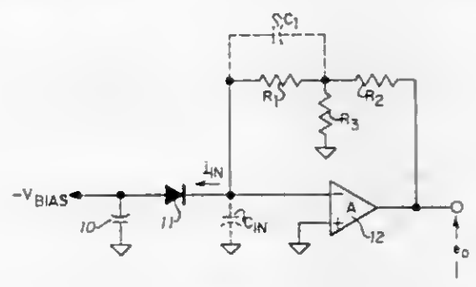
1. An apparatus for generating a current varying linearly with absolute temperature, comprising:
first and second transistors each comprising a base, an emitter and a collector, said transistors having conductive areas of different sizes;
means in the form of at least one regeneratively coupled transistor pair connected to the collectors of the first and second transistors for forcing equal currents through the first and second transistors to operate them at different current densities, thereby to produce different base-to-emitter voltages in the first and second transistors; and
means responsive to the difference in the base-to-emitter voltages of the first and second transistors for developing a current corresponding to the difference in base-to-emitter voltages.

4,029,975
LOW-CROSSTALK-AUTOMATIC RESETTING SCHEME FOR JOSEPHSON JUNCTION LOGIC CIRCUIT
Hans H. Zappe, Granite Springs, N.Y., assignor to International Business Machines Corporation, Armonk, N.Y.
Continuation of Ser. No. 422,959, Dec. 7, 1973, abandoned. This application Jan. 14, 1975, Ser. No. 540,762
Int. Cl.² H03K *3/38, 19/195;* **H01L** *39/22*
U.S. Cl. 307—306 **17 Claims**



1. A Josephson array comprising at least two Josephson junctions connected in series in a line adapted to carry current to said junctions, said junctions generating transients due to switching, said line including means disposed between said two junctions for substantially preventing said transients from passing between said two junctions.

4,029,976
AMPLIFIER FOR FIBER OPTICS APPLICATION
Franklin H. Fish, and Rodney S. Katz, both of Indianapolis, Ind., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.
Filed Apr. 23, 1976, Ser. No. 679,629
Int. Cl.² H03K *3/42;* **H03D** *1/00*
U.S. Cl. 307—311 **6 Claims**

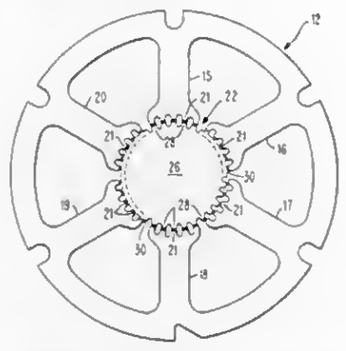


I. In an electro-optical transmission line, a receiver for converting light signals to electrical signals comprising,
a photodiode for receiving light inputs and having an electrical input terminal and an output signal port for providing electrical signals proportional to the input of light to said photodiode,
a source of voltage connected to said electrical input terminal for reverse biasing said photodiode,
an amplifier having an output terminal and an input terminal connected to said output signal port of said diode, and
a T-network feedback circuit connected between said amplifier output terminal and said input terminal for increasing transimpedance gain-bandwidth product of said amplifier.

4,029,977
ROTARY STEPPER MOTOR AND METHOD OF OPERATION

Hi Dong Chai, Binghamton, and Joseph Paul Pawletko, Endwell, both of N.Y., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Nov. 26, 1975, Ser. No. 635,535
Int. Cl.² H02K *37/00*
U.S. Cl. 310—49 R **7 Claims**



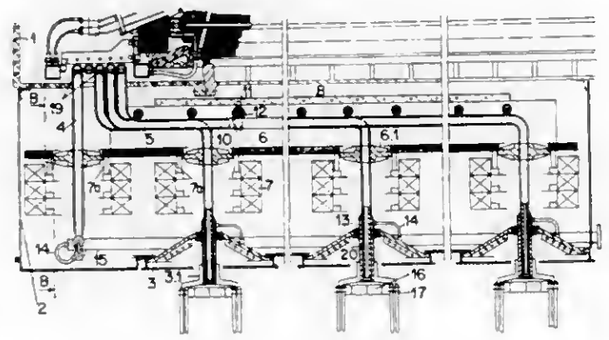
1. In a three-phase rotary stepper motor of the variable reluctance type comprising:
an annular stator having three pairs of uniformly spaced, diametrically opposed, inwardly extending poles with the pole faces thereof having equally spaced teeth;
a cylindrical rotor having a periphery with equally spaced teeth separated from said pole faces by a uniform air gap,
said rotor teeth and said stator teeth being disposed to limit occurrence of exact alignment to predetermined teeth while causing misalignment of all the other teeth;
the method of operating said motor comprising:
magnetizing said stator poles in a sequence of successive steps such that in each step
first and second adjacent pole pairs are concurrently magnetized with adjacent poles having opposite polarity and diametrically opposed poles having the same polarity,
said magnetized first and second pole pairs being separated by a magnetically neutral third pole pair, and
then magnetizing the neutral third pole pair concurrently with and to have a polarity opposite from the adjacent second pole pair while causing the first pole pair ot become magnetically neutral.

4,029,978
POWER TERMINAL STRUCTURE FOR STATOR COMPONENT OF HIGH-OUTPUT TURBO-GENERATOR

Kurt Jäger; Eugen Kunz, and Josko Vlah, all of Mannheim, Germany, assignors to BBC Brown Boveri & Company Limited, Baden, Switzerland

Filed June 20, 1975, Ser. No. 588,624
Claims priority, application Germany, July 3, 1974, 2431958
Int. Cl.² H02K *9/00*
U.S. Cl. 310—64 **9 Claims**

1. The combination with a high-output three-phase turbo-generator the housing of which is filled with a non-combustible and non-oxidizing gas at a pressure level slightly exceeding atmospheric and wherein the rotor conductors and the stator conductors are cooled by circulation of a liquid coolant, of a stator conductor terminal assembly for electrically leading out the phase windings from the coil heads, said conductor terminal assembly comprising a casing secured to the underside of and extending longitudinally of the generator housing, and communicating with the interior of said housing at hollow switching leads connected to the phase windings, a metallic plate located within said casing and extending longitudinally thereof, elastic means securing said metallic plate in place within said casing, a plate of insulating material likewise located within said casing and extending longitudinally thereof in parallel spaced relation with said metallic plate, three hollow terminal conductors insulated throughout their entire length against the full voltage of the stator windings, said conductors being connected respectively at one end thereof to corresponding switching leads and which extend from the latter in a first section directed vertically downward thence in a second section directed horizontally for different distances through the space between said metallic and insulating plates and thence in a third section directed vertically downward through elastic supports therefor secured to said insulating

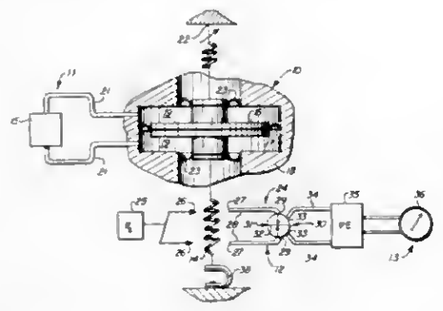


plate, means securing the horizontally extending second sections of said hollow conductors to said metallic plate, said third vertically downward extending sections of said hollow conductors ending in polygon-shaped connection terminals and being passed through openings provided in the bottom wall of said casing, and secured in place by means of gas-tight elastic support members attached to the wall of the casing, a fluid coolant duct located within said casing, and means connecting the interior of said hollow conductors with said fluid coolant duct.

4,029,979
FLUIDIC TO ELECTRIC TRANSDUCER AND METHOD

Donald W. Chapin, Scottsdale, Ariz., assignor to The Garrett Corporation, Los Angeles, Calif.

Continuation-in-part of Ser. No. 587,457, June 16, 1975. This application May 13, 1976, Ser. No. 685,853
Int. Cl.² H01L *41/04*
U.S. Cl. 310—8.2 **20 Claims**

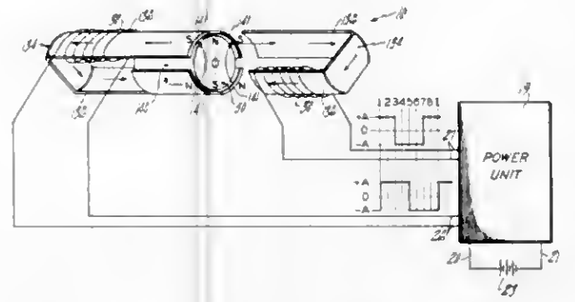


1. A fluidic to electric transducer comprising:
an element supported under tension for vibratory movement;
means responsive to a variable fluidic input to change the tension of said element;
a second means directing a jet of fluid under pressure against said element to cause vibration thereof at the frequency determined by the tension of said element, such vibration converting said fluid jet into a pulsating signal; and
means receiving said pulsating signal and converting the same into an electric signal proportional to the fluidic input employed to change the tension of said element.

4,029,980
ROTARY ELECTRIC MOTOR

John Griffith Gamble, Simsbury, Conn., assignor to Veeder Industries, Inc., Hartford, Conn.

Filed Feb. 4, 1975, Ser. No. 546,938
Int. Cl.² H02K *21/14*
U.S. Cl. 310—112 **4 Claims**

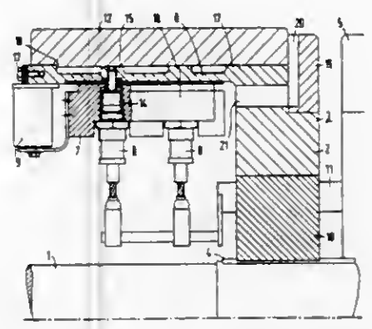


1. A rotary electric motor comprising a rotatable generally cylindrical elongated two pole permanent magnet armature with a generally diametral magnetic axis, two stators for the armature having separate generally U-shaped stator cores, each having exactly two substantially diametrically opposed axially extending elongated stator poles with elongated axially extending substantially diametrically opposed generally rectangular pole faces, the two stators providing an annular arrangement of exactly four said elongated axially extending stator pole faces encircling the elongated generally cylindrical permanent magnet with the pole faces substantially equiangularly spaced thereabout, a single separate coil encircling each separate generally U-shaped stator core for selectively magnetizing the core in opposite directions, and electrical power supply means for supplying full wave AC power to each separate coil and with the AC power supplied to the two separate coils being in generally 90° out-of-phase relationship.

4,029,981
ROTATING RECTIFIER ASSEMBLY FOR ELECTRIC MACHINES

Heinrich Küter, Wattenscheid, and Erich Weghaupt, Mulheim (Ruhr), both of Germany, assignors to Kraftwerk Union Aktiengesellschaft, Germany

Filed July 10, 1975, Ser. No. 594,751
Claims priority, application Germany, July 11, 1974, 2433464
Int. Cl.² H02K *11/00*
U.S. Cl. 310—68 D **3 Claims**

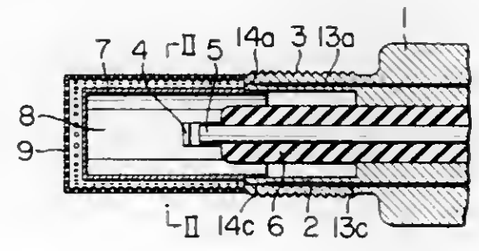


1. In a multiphase bridge circuit for electric machines, a rotating rectifier assembly having active components including cooling members, rectifier cells and safety fuses, and comprising a carrier wheel having a radially inner hub and a radially outer annular flange connected to said radially inner hub, the active components being radially outwardly braced at the inner side of said annular flange, said annular flange being formed of two parts, one of said parts being a radially inner flange ring of unitary construction with said hub, said radially inner flange ring formed with openings and solely containing all the openings for receiving therein and for securing the active components to said annular flange, and the other of said parts being radially outer cap ring without bores or recesses formed therein and of very strong material and being in press-fitting engagement with said flange ring, said cap ring and having uniform cross-sectional area over its axial length.

4,029,982
PLUG FOR INTERNAL COMBUSTION ENGINE FOR LIMITING PRODUCTION OF NITROGEN OXIDE

Hidetsugu Kubota, No. 122, 3-chome, Motomachi, Kameda, Naka Kanbara-gun, Niigata-ken, Japan

Filed Feb. 11, 1976, Ser. No. 657,299
Claims priority, application Japan, Feb. 17, 1975, 50-19534
Int. Cl.² F23Q *3/64*
U.S. Cl. 313—11.5 **4 Claims**

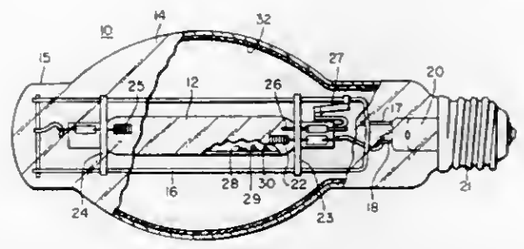


1. A plug for use in an engine cylinder comprising,
a. ignition electrodes,
b. an inner cover surrounding said electrodes, said inner cover having an opening to provide communication between said electrodes and said engine cylinder,
c. an outer cover surroundingly spaced from said inner cover and having an opening in juxtaposition with said inner cover opening,
d. said outer cover having perforations whereby water injected between said inner and outer covers is evaporated into steam upon engagement with said outer cover, said steam passing through said perforations into said cylinder in a direction away from said electrodes.

4,029,983
METAL-HALIDE DISCHARGE LAMP HAVING A LIGHT OUTPUT WITH INCANDESCENT CHARACTERISTICS

William A. Thornton, Cranford, N.J., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 25, 1976, Ser. No. 670,490
Int. Cl.² H01J *61/18, 61/34, 61/44*
U.S. Cl. 313—25 **17 Claims**



1. A high-pressure metal-halide discharge lamp comprising;
an arc tube of fused silica containing mercury, sodium, a halogen, scandium, and an ionizable fill gas,
a light-transmitting outer envelope surrounding said arc tube,
means supporting said arc tube in predetermined spaced-apart relationship with said outer envelope, and
means for modifying the color-rendering characteristics and

chromaticity of the light generated by the arc tube, when said lamp is energized, comprising a coating on the interior surface of the outer envelope that luminesces in response to impinging radiations emitted by said arc tube, said luminescent coating comprising a blend of green-emitting material and red-emitting material,

said green-emitting material being at least one phosphor of the group consisting of copper-activated zinc sulfide, zinc silicate and cerium-activated calcium sulfide, and

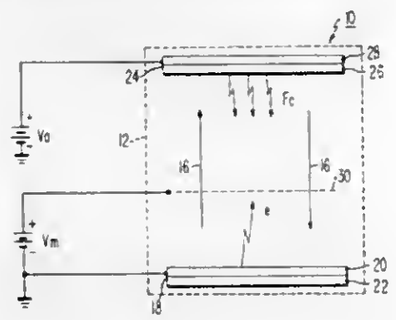
said red-emitting material being at least one phosphor of the group consisting of europium-activated yttrium vanadate, europium-activted strontium sulfide, europium-activated calcium sulfide and europium-activated yttrium vanadate phosphate.

4,029,984

FLUORESCENT DISCHARGE COLD CATHODE FOR AN IMAGE DISPLAY DEVICE

John Guiry Endriz, Plainsboro, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Nov. 28, 1975, Ser. No. 636,096
Int. Cl.² H01J *39/06, 31/48, 43/10*
U.S. Cl. 313—96 **10 Claims**



1. An image display device comprising an evacuated envelope within which is disposed a plurality of cathodoluminescent cells in a matrix array, each cell including:

a. a source of electrons comprising:

1. An anode electrode having means for producing electromagnetic radiation in response to bombardment by electrons;

2. a cathode electrode having means for emitting electrons in response to impinging electromagnetic radiation;

3. an open channel between said anode electrode and said cathode electrode whereby a fraction F_c of the electromagnetic radiation produced by said anode electrode is clear to feed back to and impinge upon said cathode electrode; and

4. means for sustaining a flow of electrons from said cathode electrode to said anode electrode;

b. electron beam formation means;

c. means for modulating a flow of electrons from said electron beam formation means;

d. means for accelerating the modulated flow of electrons; and

e. a cathodoluminescent screen excitable by the accelerated and modulated flow of electrons, said screen being separate from said anode electrode.

4,029,985

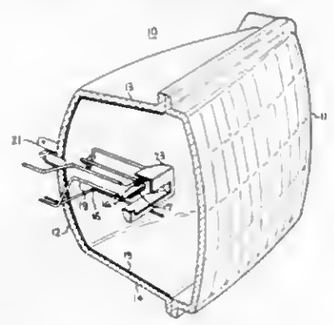
RECTANGULAR HEADLAMP FILAMENT SHIELD

Bernard W. Rachel, Lyndhurst, Ohio, assignor to General Electric Company, Schenectady, N.Y.

Filed Mar. 24, 1976, Ser. No. 669,985
Int. Cl.² F21V *7/14;* **H01K** *1/26, 1/30*
U.S. Cl. 313—115 **9 Claims**

1. In a rectangular headlamp having a lens, a reflector in the shape of paraboloid intersected by four planes which form the sidewalls thereof, and at least one filament positioned in the region of the focus of said paraboloid, the improvement comprising:

filament shield means having a first portion positioned between said filament and said lens and a second portion



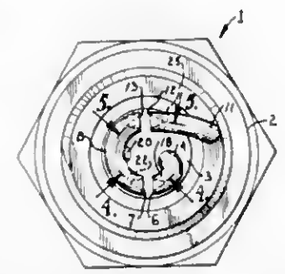
comprising a plurality of tabs positioned between said filament and respective sidewalls, wherein said first portion is geometrically similar to said lens and said tabs are geometrically similar to the respective sidewalls.

4,029,986

SPARK PLUG

Jose Hector Lara, and Edward B. Williams, Jr., both of P. O. Box 876, Greenville, Tex. 75401

Filed May 20, 1976, Ser. No. 688,137
Int. Cl.² H01T *13/46*
U.S. Cl. 313—123 **4 Claims**



1. In a spark plug having an insulator and a metal shell:

a. a first electrode for connection to a source of timed electrical pulses, said first electrode having a free end with a recess therein, said recess having a depth of less than a transverse dimension of said first electrode;

b. a second electrode insulated from said first electrode and having a first free end extending toward and aligned with said free end of said first electrode and spaced therefrom to define a first spark gap therebetween, said second electrode first free end having a recess therein with a depth of less than a transverse dimension of said second electrode first free end, said second electrode first free end having a bore extending transversely therethrough and intersecting and communicating with said recess in said second electrode first free end, said second electrode having a second free end extending therefrom and in opposed relation to said first free end of said second electrode, said second electrode second free end having a recess therein with a depth of less than a transverse dimension of said second electrode second free end; and

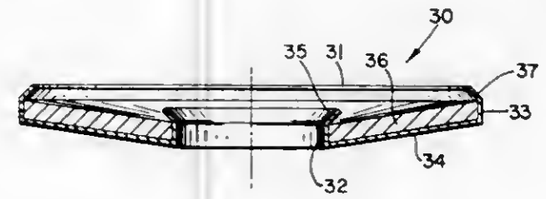
c. a third electrode having a ground connection with a metal shell of a spark plug, said third electrode having a free end extending toward and aligned with said second end of said second electrode and spaced therefrom to define a second spark gap therebetween, said third electrode free end having a recess therein with a depth of less than a transverse dimension of said third electrode free end, said third electrode free end having a bore extending transversely therethrough and intersecting and communicating with said recess in said third electrode free end.

4,029,987

WIDE CHANNEL GETTER DEVICE

Mario Zucchinelli, Milan, Italy, assignor to S.A.E.S. Getters S.p.A., Milan, Italy

Filed Apr. 16, 1975, Ser. No. 568,558
Claims priority, application Italy, Apr. 16, 1974, 21447/74
Int. Cl.² H01J *19/70, 29/94*
U.S. Cl. 313—174 **16 Claims**



1. A getter device comprising an annular ring having

1. an inner side wall, 2. an outer side wall, 3. a bottom wall joining the outer wall to the inner wall,

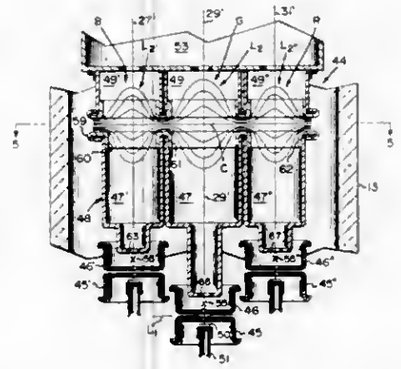
4. an evaporable getter material supported by said ring, characterized by the fact that the upper portion of the side walls disposed above said getter material are convergent relative to each other, the outer wall converging radially inwardly and upwardly, the inner wall converging radially outwardly and upwardly, such that the area of the convergent walls projected perpendicularly onto the upper exposed surface area of said getter material is no more than 20% of said upper exposed surface area.

4,029,988

CRT IN-LINE ELECTRON GUN ASSEMBLY

Donald L. Say, Waterloo, N.Y., assignor to GTE Sylvania Incorporated, Stamford, Conn.

Filed June 24, 1976, Ser. No. 699,424
Int. Cl.² H01J *29/50, 29/51*
U.S. Cl. 313—414 **5 Claims**



1. An improvement in a cathode ray tube three-beam in-line bi-potential electron gun assembly having a longitudinal axis therethrough and including electron generating means formed to separately emit each of the respective electron beams of substantially differing current levels, such beams being directed from a center and two side-related guns to selectively impinge a spatially related patterned electron responsive screen, each of said beams emanating from a gun structure formed of a plurality of related electrode members including a control electrode, an initial accelerator, a focusing electrode and a final accelerator positioned and supported by longitudinal insulative members in a sequential manner forward of a rear-oriented cathode member to effect the formation and control of each of said beams, said improvement comprising:

a unitized final accelerator having three in-line apertures defined therein, the center one of which is larger in diameter;

a unitized focusing electrode structure having a forward apertured portion in the form of a planar integrating member wherein three in-line oriented apertures are defined in a common plane spatially related to the apertures of said final accelerator, the forward aperture of the center gun being larger than those of the two side-related guns, said forward apertures being located in a substantially common plane, said focusing structure having a rear aperture arrangement whereat three spatially related apertures are arranged to accommodate each of said beams, the rear apertures of all of said guns being substantially equal in diameter, said rear apertures of said side-related guns being located in a substantially common plane while the aperture of said center gun is in a separate rearward oriented plane parallel thereto;

an arrangement of apertured initial accelerator members positioned in substantially equal spaced relationship with the respective rear apertured portions of said focusing electrode structure, the aperture portions of the side-related accelerators being in a substantially common plane while the center gun accelerator is in a separate rearward oriented plane parallel thereto; and

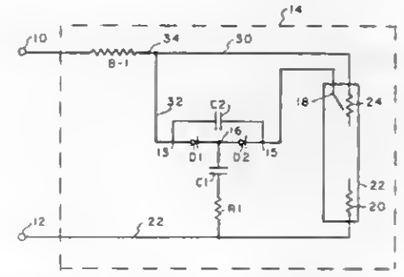
an arrangement of apertured control electrode members positioned in substantially equal spaced relationship with the respective initial accelerator members, the aperture portions of the side-related control electrodes being in a substantially common plane while the center gun control electrode is in a separate rearward oriented plane parallel thereto.

4,029,989

ELECTRIC DISCHARGE LAMP WITH VOLTAGE MULTIPLIER CIRCUIT HAVING A CAPACITANCE WHICH CHANGES WITH TEMPERATURE

Mark W. Fellows, Cranbury, N.J., assignor to North American Philips Corporation, New York, N.Y.

Filed Sept. 12, 1975, Ser. No. 612,717
Int. Cl.² H01J *7/44, 13/46, 17/34, 19/78*
U.S. Cl. 315—51 **5 Claims**



1. A discharge lamp for connection to an associated alternating current power supply which comprises:

a lamp envelope including a base which includes first and second connection means for connection to the associated alternating current power supply;

a discharge tube disposed within said envelope;

first and second main electrodes disposed at first and second ends respectively of said discharge tube;

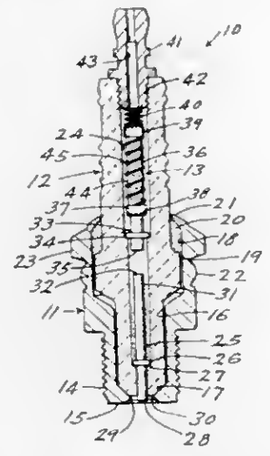
a starting electrode disposed at said first end of said discharge tube;

means for voltage multiplying connected to said first and second connection means, said starting electrode and one of said main electrodes, said means for voltage multiplying including a first capacitor having a capacitance which changes capacitance by a factor of at least 10 times with a temperature change of 175° C, said voltage multiplying means disposed within said envelope.

4,029,990
SPARK PLUG CONSTRUCTION

William L. Nagy, Northwood, and Robert J. Craver, Sylvania, both of Ohio, assignors to Champion Spark Plug Company, Toledo, Ohio

Filed Jan. 9, 1976, Ser. No. 647,819
Int. Cl.² H01T 13/46
U.S. Cl. 315—62 4 Claims

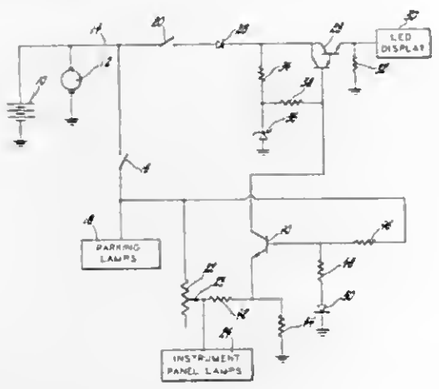


1. An improved spark plug for use in an internal combustion engine having a capacitive discharge ignition system, said spark plug comprising, in combination, a tubular metal shell having an exterior threaded section for threadably engaging the engine, ground electrode means in electrical circuit with said shell, an insulator mounted in said shell, said insulator having an axial bore extending therethrough, a center electrode, and means mounting said center electrode in said shell, said center electrode including tip means mounted to project from said insulator bore for defining a primary spark gap with said ground electrode means, a low resistance inductive suppressor having two ends, means forming an auxiliary spark gap within said insulator bore between said tip means and one end of said inductive suppressor, and terminal means for connecting the other end of said inductive suppressor to the capacitive discharge ignition system, said inductive suppressor having an inductance and said auxiliary spark gap having a gap size for suppressing oscillatory electrical ignition noise.

4,029,991
INSTRUMENT PANEL ILLUMINATION DIMMING CONTROL

Frederick K. Schultz, Bringhurst, Ind., assignor to General Motors Corporation, Detroit, Mich.

Filed Apr. 14, 1976, Ser. No. 676,730
Int. Cl.² H05B 37/02, 43/00
U.S. Cl. 315—135 3 Claims



1. In an automotive instrument panel illumination circuit for a vehicle having a power supply subject to voltage fluctuations and a manually positioned dimmer control potentiometer connected to the power supply and providing a variable dimmer voltage for instrument panel illumination, a circuit for providing a variable supply voltage to light emitting diodes on the instrument panel comprising:

control means having an input terminal for controllably delivering a supply voltage from the power supply to the light emitting diodes according to a control voltage applied to the terminal input,

voltage regulator means for providing a maximum control voltage to the input terminal of the control means to establish a maximum supply voltage to the light emitting diodes which is sufficient to provide full light intensity,

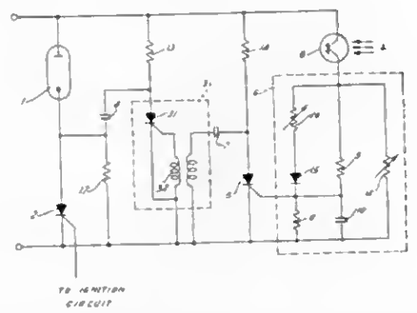
means connected to the power supply and the dimmer control potentiometer including a differential voltage detector sensitive to the voltage difference between the power supply voltage and the dimmer voltage for reducing the control voltage at the input terminal of the control means to effect dimming of the light emitting diodes according to the detected voltage difference,

whereby the light emitting diode intensity is dependent on the dimmer potentiometer position and substantially independent of power supply voltage fluctuations.

4,029,992
FLASH APPARATUS WITH FLASH TERMINATING SWITCH CONTROLLED BY PHOTOSENSOR

Heinz Engelstätter, Bad Soden, Germany, assignor to Braun Aktiengesellschaft, Frankfurt am Main, Germany

Filed May 2, 1975, Ser. No. 574,093
Claims priority, application Germany, Apr. 8, 1974, 2422237
Int. Cl.² H05B 41/02, 41/32
U.S. Cl. 315—156 6 Claims



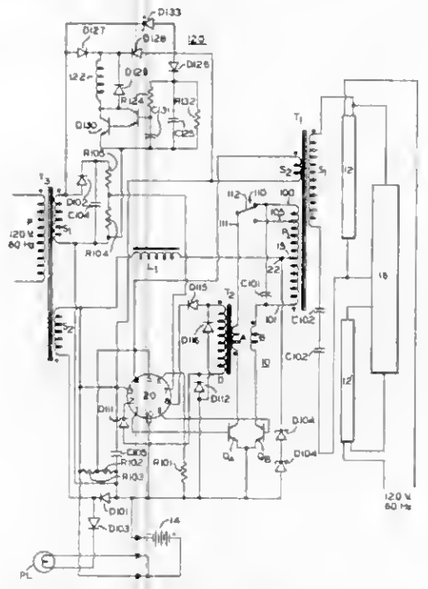
1. In the electronic flash unit of the type operative for producing flashes the duration of which is automatically controlled in dependence upon the scene brightness during the flash, in combination, a flash element; means for igniting the flash element; terminating means for terminating the flash produced by the flash element and including an electronic flash-terminating switch having a control electrode and operative when activated for causing the terminating means to terminate the flash; an integrating capacitor and means providing a current path for the capacitor; a charging resistor connected in the current path of the integrating capacitor and carrying a component of the integrating capacitor current, the charging resistor being operative for affecting the rate at which the integrating capacitor charges; means connecting the junction between the charging resistor and the integrating capacitor to the control electrode of the electronic flash-terminating switch for controlling the conductivity of the switch in dependence upon the voltage across the integrating capacitor; a light-sensing element connected in the current path of the integrating capacitor operative for making the capacitor current a function of sensed scene light; and a diode connected across the charging resistor with a polarity such as to carry a further component of the integrating capacitor current, the diode presenting to such further current component

a resistance which varies in inverse dependence upon variations in the voltage across the charging resistor.

4,029,993
TWO LEVEL INVERTER CIRCUIT

Robert Philbrick Alley, and Keith Karl Klett, both of Danville, Ill., assignors to General Electric Company, Carmel, Ind.

Filed Dec. 18, 1975, Ser. No. 642,014
Int. Cl.² H05B 41/29
U.S. Cl. 315—219 11 Claims



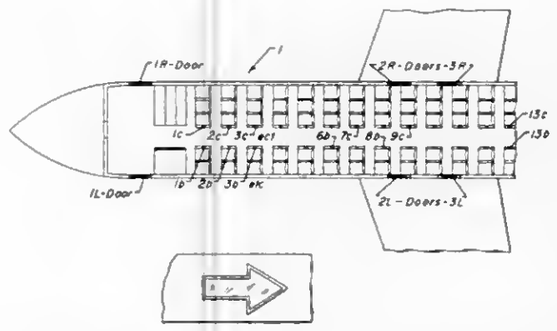
4. In an emergency lighting circuit for operating at least one gaseous discharge lamp including means for connection to an AC electrical energy source for energizing the lamp during normal conditions when the AC source voltage is above a predetermined value and an inverter having an output and an auxiliary electrical energy source for operating the lamp during emergency conditions when the AC source voltage is below a predetermined value, the improvement comprising:

switching means in the circuit for automatically operating the inverter on at least two power levels for better matching the inverter output capabilities to the lamp starting requirements and after starting, to lamp run requirements thereby to conserve energy in the auxiliary electrical energy source.

4,029,994
EMERGENCY FLASHING LIGHT SYSTEM FOR INDICATING EXITS OF PASSENGER CARRIERS

Robert C. Iwans, Hartford, Conn., assignor to UOP Inc., Des Plaines, Ill.

Filed Jan. 5, 1976, Ser. No. 647,276
Int. Cl.² H05B 37/02
U.S. Cl. 315—323 4 Claims



1. An emergency stroboscopic type of lighting system for directing passengers to an appropriate exit of a large passenger carrier having a plurality of doors, one or more of which may be unopenable in an emergency situation, which comprises in combination,

a. a strobe system including a plurality of electronic flash lamps which are maintained in spaced positions along the length of the passenger area of the carrier;

b. battery power supply means and high voltage-capacitive-trigger discharge means for each of the electronic flash lamps of the system;

c. an output driver means with switching means to connect to said flash discharge means for operating said flash lamps;

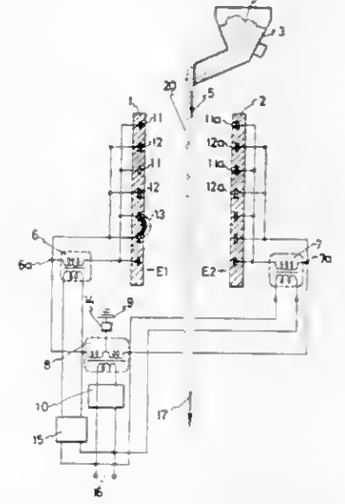
d. a time-base generator means connecting to a logic controller means and the latter in turn connecting to said output driver means to provide for the timing and switching thereof and the sequential firing of said plurality of electronic flash lamps in a manner whereby such sequential firing will create the effect of a moving light beam that will indicate a direction of egress from said carrier; and

e. a switch means at each door of the plurality thereof, each such switch being interconnected with said controller means, said controller means including programming means to provide a controlled sequence of firing from the driver means such that resulting lamp flashings will indicate directions to only such doors that are available for egress.

4,029,995
APPARATUS FOR PRODUCING CHARGED PARTICLES

Tsutomu Itoh, Tokyo, Japan, assignor to Onoda Cement Company, Ltd., Japan

Filed Jan. 6, 1976, Ser. No. 646,942
Int. Cl.² H05B 5/02
U.S. Cl. 361—226 11 Claims



1. An apparatus for producing charged particles, comprising a pair of surface-shaped ion generating electrodes, in each of which every other one of parallel linear electrodes spaced apart at a predetermined interval are connected in common to form separate electrode groups, said parallel linear electrodes, of at least one said electrode group being coated with an insulator, and an alternating voltage is applied between said respective electrode groups, and an alternating voltage is applied between said respective electrodes; a charging space formed between said pair of ion generating electrodes spaced in opposition to each other; means for shifting the phases of the alternating voltages applied to the respective ion generating electrodes relative to each other; and voltage supply means for applying between said respective ion generating electrodes another alternating voltage having a fundamental frequency twice as high as the frequency of the alternating voltage applied to the respective ion generating electrodes in

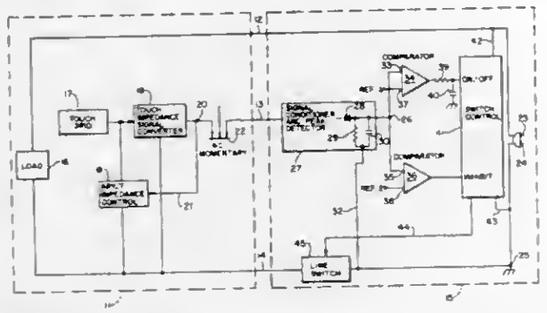
such phase relationship to said latter alternating voltage that inversion of the relative voltage between said respective electrode surfaces may not occur during the period when silent discharge is arising on one of the electrode surfaces.

4,029,996

APPARATUS HAVING A PROTECTIVE CIRCUIT

Donald Charles Mifflitt, Billerica, Mass., assignor to The Gillette Company, Boston, Mass.

Filed Mar. 8, 1976, Ser. No. 665,110
Int. Cl.² H02H *5/12*
U.S. Cl. 307—326 **17 Claims**



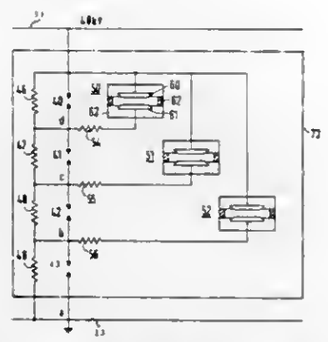
1. Apparatus electrically connectable to an AC source having a line conductor and a neutral conductor comprising:
a housing including a contact portion capable of being touched by an operator of the apparatus;
means for measuring an electrical parameter of the operator with respect to the line or neutral conductor of the AC source when the operator touches said contact portion; and
switching means electrically connectable in series with the line conductor for electrically disconnecting the apparatus from the AC source when the measured electrical parameter of the operator indicates a predetermined electrically dangerous condition for the operator.

4,029,997

SURGE VOLTAGE ARRESTER ARRANGEMENT

Hermann Wittel, Erlangen, Germany, assignor to Siemens Aktiengesellschaft, Munich, Germany

Filed Dec. 9, 1974, Ser. No. 530,970
Claims priority, application Germany, Dec. 21, 1973, 2364034
Int. Cl.² H02H *3/22*
U.S. Cl. 361—129 **11 Claims**



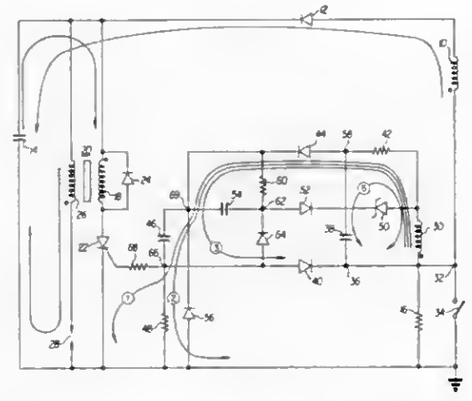
1. A surge voltage arrester module having a plurality of series arrays of spark gaps arranged in series between an upper and a lower voltage wherein the improvement comprises:
a. a plurality of controlled spark gaps, each control spark gap coupling a different junction point between two series arrays to one of the two voltages;
b. means enclosing each of said control spark gaps;
c. a gas which reduces the breakdown voltage of said control spark gaps contained within said enclosing means; and
d. means enclosing the total series array including said control spark gaps and their individual enclosures; and
e. a gas which increases the breakdown voltage of said series arrays contained within said overall enclosing means.

4,029,998

CAPACITOR DISCHARGE IGNITION CIRCUIT

Harold Elden Anderson, Los Angeles, Calif., assignor to McCulloch Corporation, Los Angeles, Calif.

Filed Mar. 3, 1975, Ser. No. 554,496
Int. Cl.² F02P *1/02*
U.S. Cl. 361—256 **4 Claims**



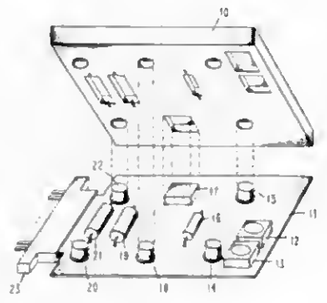
1. In a capacitor discharge ignition circuit including an ignition capacitor charged by the engine responsive rotation of a magnetic member through flux cutting proximity to a charging coil to thereby provide a charging coil waveform and discharged through an electronic switch and high voltage transformer by the engine responsive rotation of a magnetic member though flux cutting proximity to a trigger coil to thereby provide a trigger coil waveform substantially in-phase with the charging coil waveform, a method of advancing the time of discharge of the ignition capacitor relative to the engine cycle with an increase in the speed of the engine comprising the steps of providing a trigger coil waveform with a plurality of voltage peaks in a major wave component thereof and discharging the ignition capacitor responsively to the first of said voltage peaks with an amplitude exceeding a predetermined value.

4,029,999

THERMALLY CONDUCTING ELASTOMERIC DEVICE

Edward William Neumann, and Edward John Rabenda, Jr., both of Poughkeepsie, N.Y., assignors to IBM Corporation, Armonk, N.Y.

Filed Apr. 10, 1975, Ser. No. 566,853
Int. Cl.² H05K *7/20*
U.S. Cl. 361—386 **3 Claims**



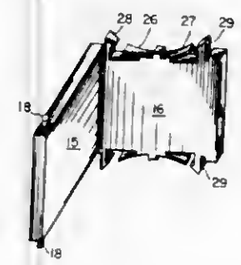
1. A device for heat transfer including heat producing electrical components of differing shapes mounted on a circuit card, a heat sink component through which said heat is to be dissipated,
a pad of a stretchable, elastomeric, thermally conducting, material,
said pad having first and second opposite surfaces, said second surface having multiple indentations each in the shape of the corresponding component on the card and replaceably fitting in glove-like relationship to the exterior of each component on said card to provide a snug interface for heat transfer from the components to the pad, and
said pad first surface contacting said heat sink component whereby said pad provides a thermal path from the heat-producing components to the heat sink component.

4,030,000

CORNER SUPPORT MEMBER FOR SUBSCRIBER CARRIER CHANNEL UNIT ASSEMBLY

James R. Stewart, Sao Jose, and Donald G. Tweed, Mountain View, both of Calif., assignors to GTE Automatic Electric Laboratories Incorporated, Northlake, Ill.

Filed Mar. 1, 1976, Ser. No. 662,638
Int. Cl.² H05K *1/04, 7/12*
U.S. Cl. 361—400 **33 Claims**



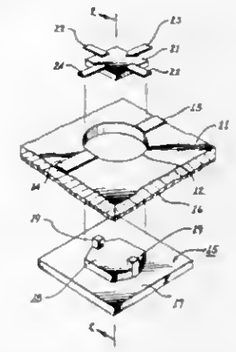
1. A member for holding a pair of printed circuit cards in a fixed, spaced-apart, adjacent and parallel relationship; groups of holes being formed in the same pattern at various locations in the faces of each card, at least one hole of each group extending all the way through the card; comprising:
first and second plates being located adjacent to each other and being joined together along one edges thereof for forming an angle therebetween which is different from 0° and 180°; at least a portion of opposing edges of said plates that are adjacent the one joined-together edges thereof being adapted for contacting faces of the cards;
a peg located on each of said opposing edges of said first plate;
a flexible post located on each of said opposing edges of said second plate; and
an arm extending from each of said posts proximate the end thereof that is spaced from said second plate in a direction substantially parallel to said portions of said opposing edges thereof;
said post and peg on the same side of said plates being located thereon such that they fit into corresponding holes in the same group of holes in a card, said arm being spaced from the portion of the associated opposing edge of said second plate a distance causing said arm to snap over the associated card to securely hold it in position, the pegs operating as load-bearing members when axial pressure is exerted on a plate in a plane parallel to the cards.

4,030,001

CO-PLANAR LEAD CONNECTIONS TO MICROSTRIP SWITCHING DEVICES

Max W. Medley, Jr., and James H. Ward, Jr., both of Largo, Fla., assignors to E-Systems, Inc., Dallas, Tex.

Filed Nov. 19, 1975, Ser. No. 633,344
Int. Cl.² H05K *1/04*
U.S. Cl. 361—401 **9 Claims**



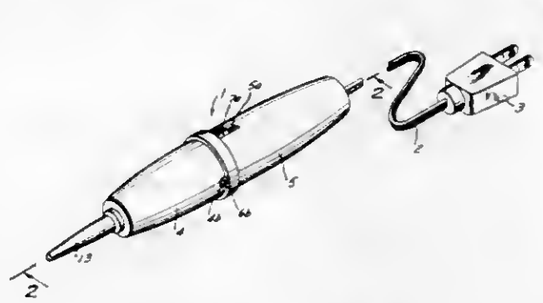
1. A method for assembling a switching device package having a plurality of terminal leads with a microstrip substrate having an input lead and an output lead on one surface of the substrate and a ground plane on the opposite surface of the substrate, said method comprising the steps of:
a. providing a hole extending through said substrate to separate the input and output leads thereof;
b. inserting a conductive member through the hole in said substrate;
c. connecting said conductive member to the ground plane of said substrate;
d. extending the ground plane of said substrate through said conductive member to become substantially co-planar with the one surface of said substrate;
e. positioning said switching device on said conductive member and generally below the extended ground plane; and
f. making co-planar connections from the terminal leads of said switching device package to the input and output leads and to said conductive member.

4,030,002

DEGAUSSER

George Alexandrovich, Sr., 7 Glenmere Court, Commack, N.Y. 11725, and Edward Perper, 1125 E. 57th St., Brooklyn, N.Y. 11234

Filed Nov. 6, 1975, Ser. No. 629,547
Int. Cl.² H01F *13/00*
U.S. Cl. 361—151 **13 Claims**



1. A degausser for degaussing magnetized components, comprising an elongated hollow housing having an internal surface and subdivided at a plane transverse to the elongation thereof into two discrete housing sections having respective detent recesses; a support having a plurality of elastically yieldable support portions which contact said internal surface of said housing to thereby position and support said housing sections on said support element, and of elastically yieldable

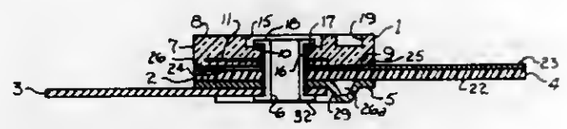
detent projections which engage with snap action in said detent recesses of said housing sections to thereby connect the latter to said support element, said support element including a flat portion, and a tubular portion of magnetically permeable material, which are rigid with one another and extend longitudinally of said housing, said flat portion and one part of said tubular portion being accommodated in said housing, and another part of said tubular portion extending to the exterior of and longitudinally beyond said housing for juxtaposition with a component to be degaussed; and means for generating a magnetic field in the circumambient region of said other part of said tubular portion to degauss the component upon juxtaposition of said other part therewith, including a core received in and surrounded by said tubular portion of said support element and extending within said parts thereof, a coil convoluted at least around a region of said one part of said tubular portion of said support element, and means for supplying electric current to said coil so as to generate an electromagnetic field which penetrates through said tubular portion of said support element and acts on the component juxtaposed with said other part of said tubular portion.

4,030,003

MINIATURE TRIMMER WITH FLEXIBLE PLASTIC BASE

Harold E. Wright, 162 Putnam Drive, Erie, Pa. 16511, and Lee A. Donatelli, 14 Summit St., Erie, Pa. 16508

Filed Aug. 22, 1975, Ser. No. 607,031
Int. Cl.² H01G 5/06
U.S. Cl. 361—293 **3 Claims**



1. A trimmer capacitor comprising a rigid dielectric disc having upper and lower surfaces and a center hole normal to said surfaces, the lower surface being flat, said disc having a rotor electrode above said lower surface and including a metal coating on said upper surface, a metal clad flexible sheet of dielectric material having on one side metal cladding presented to and engaging and making conforming contact with said lower surface, said sheet having a section registering with said disc and an integral terminal extending from said section, said metal cladding being removed to provide a stator electrode integral with said terminal on the one side of said hole and a balance pad on the opposite side of said hole, a compression washer engaging the unclad side opposite said one side and exerting a force on said sheet holding the stator electrode and balance pad against said lower surface, a rotor terminal engaging the under side of said washer, and a hollow rivet having a flange making contact on said upper surface around the hole and a flange making contact with and holding said rotor terminal against the under side of said washer.

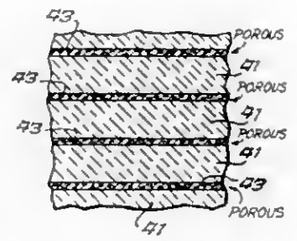
4,030,004

DIELECTRIC CERAMIC MATRICES WITH END BARRIERS

Truman C. Rutt, Niagara Falls, N.Y., assignor to NL Industries, Inc., New York, N.Y.

Continuation-in-part of Ser. No. 274,668, July 24, 1972, abandoned, which is a continuation-in-part of Ser. No. 134,689, April 16, 1971, Pat. No. 3,679,950. This application Mar. 24, 1975, Ser. No. 561,297
Int. Cl.² H01G 4/08, 4/147
U.S. Cl. 361—313 **8 Claims**

1. A sintered, unitary ceramic body comprising: a plurality of strata of a dense dielectric or insulating ceramic composition, said strata alternating with open-structured areas substantially parallel with said strata and extending to edges of said body, each of said open-structured areas containing at least some solid material and alternate ones of said open-structured areas extending to different edge regions of said body; and a penetrable barrier over each of said edge regions,



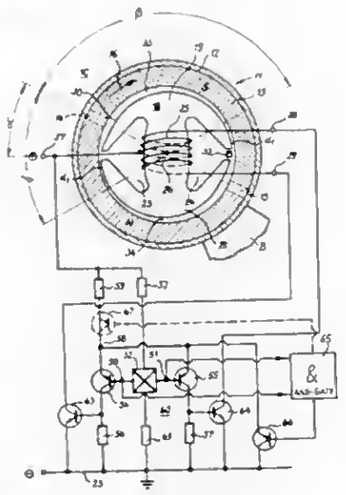
said barriers permitting molten metal to be forced by pressure into said areas.

4,030,005

BRUSHLESS D.C. MOTOR HAVING ROTOR POSITION-DEPENDENT CONTROL MEANS

Benno Doemen, St. Georgen, Germany, assignor to Papst-Motoren KG, St. Georgen, Germany

Filed Apr. 23, 1975, Ser. No. 570,837
Claims priority, application Germany, Apr. 23, 1974, 2419432
Int. Cl.² H02K 29/00
U.S. Cl. 318—138 **50 Claims**



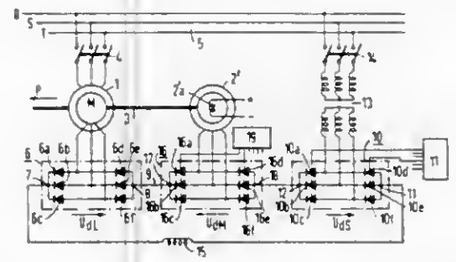
1. Brushless d.c. motor comprising:
a stator (18) having motor winding means (25, 26);
a permanent magnet rotor (11) rotatable relative to said stator;
a source of direct current (27, 53);
a rotor position-dependent semiconductor control means (32) having two pairs of terminals;
amplifying means responsive to said rotor position-dependent control means (32) and coupled to said direct current source and to said motor winding means for commutating the current in the motor winding means such that said motor winding means produces, in operation, an alternating magnetic field;
and a voltage divider (71, 72) having its end terminals coupled to one pair of the output terminals of the rotor position-dependent control means (32);
wherein said amplifying means includes a differential amplifier means (60) coupled to the other pair of output terminals of said semiconductor control means (32), the amplifying means having three output branches (54, 55, 66), two of said branches (54, 55) being coupled to control the currents in said motor winding means (25, 26);
and the voltage division ratio of the voltage divider (71, 72) being set such that the voltage of the tap point (70) of the voltage divider, when the rotor position-dependent control means (32) is subjected to a small or non-existent signal, will control said amplifying means so that current in said two branches tends to zero and current flow to said motor windings is blocked, said third branch substantially taking over and drawing the current of the differential amplifier means (60).

4,030,006

SPEED CONTROLLABLE DRIVE FOR AN ASYNCHRONOUS MOTOR

Harald Elger, Erlangen, Germany, assignor to Siemens Aktiengesellschaft, Munich, Germany

Filed Apr. 10, 1975, Ser. No. 566,789
Claims priority, application Germany, Apr. 16, 1974, 2418332; Nov. 26, 1974, 2455876
Int. Cl.² H02P 7/36
U.S. Cl. 318—197 **8 Claims**



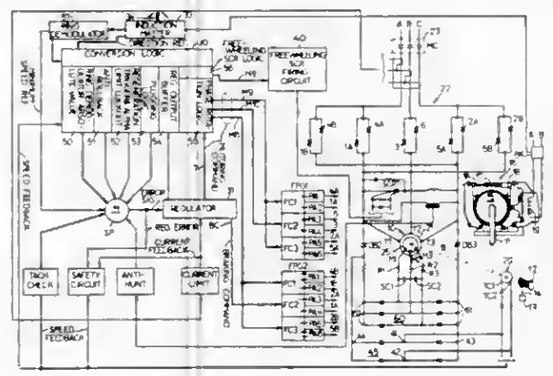
1. A speed controllable three phase drive comprising:
a. an asychronous motor having a slip ring rotor;
b. means for coupling the stator of said asynchronous motor to a three phase network;
c. a three phase synchronous motor having its shaft mechanically coupled to the shaft of said asynchronous motor;
d. an uncontrolled rectifier having its a.c. input coupled to the slip rings of said asynchronous motor;
e. a controlled inverter made up of a plurality of controlled rectifiers in a bridge arrangement feeding said three phase synchronous motor with its a.c. output; and
f. a controlled static converter having an a.c. input coupled to said three phase network, the d.c. terminals of said controlled static converter, said controlled inverter and said rectifier coupled in series with each other.

4,030,007

DIRECT CURRENT BRAKING MEANS FOR WOUND ROTOR MOTOR

Lester A. Price, Greenfield, and James N. Nash, New Berlin, both of Wis., assignors to Harnischfeger Corporation, West Milwaukee, Wis.

Filed Aug. 25, 1975, Ser. No. 607,601
Int. Cl.² H02P 3/20
U.S. Cl. 318—203 R **19 Claims**



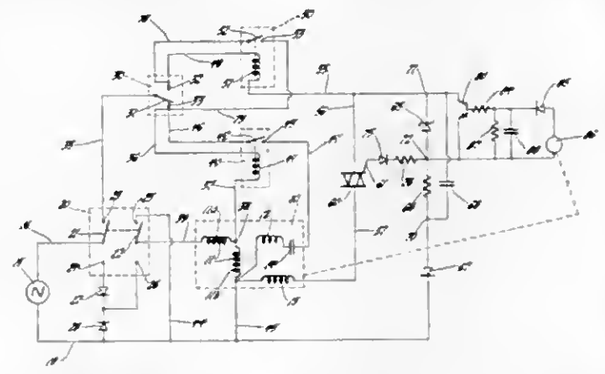
1. A system comprising:
a source of alternating current;
a hoist motor energizable from said source to hoist and lower a suspended load;
said motor comprising a stator winding energizable from said source and a rotor winding;
a brake operable when said motor is deenergized to prevent rotation of said motor and to maintain said load suspended;
control means operable when said motor exceeds a predetermined motor speed to change the applied power of the alternating current supplied to said motor from said source to produce a flow of direct current in said motor and effect direct current braking of said motor, said control means including a controlled rectifier means to smooth said flow of direct current;
first means responsive to rotation of said motor to provide an electric signal;
second means for directing said signal to said stator winding when said motor is deenergized and in the event said brake fails to maintain said load stationary to initiate a magnetic field for interaction with said rotor winding and thereby produce current flow in said rotor winding;
and third means for directing said current flow from said rotor winding to said stator winding to effect direct current braking of said motor and thereby control the speed of descent of said suspended load.

4,030,008

SINGLE PHASE ALTERNATING CURRENT MOTOR DUAL SPEED CONTROL CIRCUIT

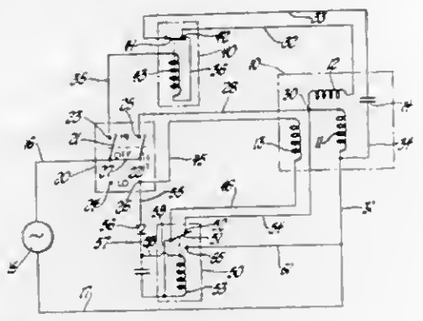
Kenneth A. Buckle, Utica, Mich.; Edwin H. Halsted, Dayton, and James O. Elliott, Xenia, both of Ohio, assignors to General Motors Corporation, Detroit, Mich.

Filed Jan. 26, 1976, Ser. No. 652,382
Int. Cl.² H02P 1/44
U.S. Cl. 318—220 B **4 Claims**



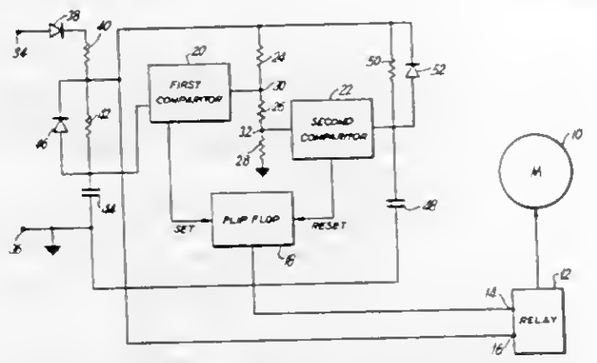
1. A single phase alternating current motor dual speed control circuit for use with a single phase alternating current motor having high speed main and starting windings and a low speed main winding comprising:
a selectively energizable energizing circuit for said high speed main winding including a first current responsive switching device sensitive to current flow through said high speed main winding for completing an energizing circuit for said high speed starting winding;
a selectively energizable energizing circuit for said low speed main winding including a bidirectional current translating device of the type capable of conducting electrical current in both directions in response to electrical control signals and a second current responsive switching device sensitive to current flow through said low speed main winding for completing an alternate energizing circuit for said high speed main winding;
means for producing electrical control signals for said bidirectional current translating device; and
means for inhibiting the producing of said control signals while the speed of said motor is greater than a predetermined value.

4,030,009
SINGLE PHASE ALTERNATING CURRENT MOTOR DUAL SPEED CONTROL CIRCUIT
Edwin Howe Halsted, Dayton, Ohio, assignor to General Motors Corporation, Detroit, Mich.
Filed Jan. 9, 1976, Ser. No. 648,044
Int. Cl.² H02P *1/44*
U.S. Cl. 318—221 R **4 Claims**



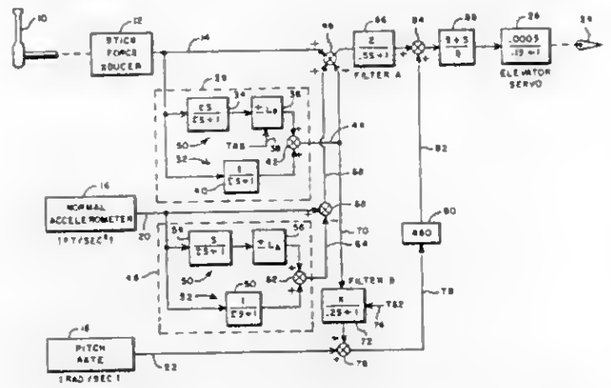
1. A single phase alternating current motor dual speed control circuit for use with a single phase alternating current motor having high speed main and starting windings and a low speed main winding comprising:
a selectively energizable energizing circuit for said high speed main and starting windings;
a selectively energizable first energizing circuit for said low speed main winding including said low speed main winding and the parallel combination of said high speed main and starting windings in series; and
a potential sensitive switching device responsive to a potential drop of a predetermined magnitude across said low speed main winding for interrupting said first energizing circuit for said low speed main winding and for establishing a second energizing circuit for only said low speed main winding.

4,030,010
TIME DELAY CONTROL CIRCUIT
Norman L. Schwartz, Stony Brook, N.Y., assignor to Multiplex Communications, Inc., Hauppauge, N.Y.
Filed Feb. 13, 1975, Ser. No. 549,764
Int. Cl.² H02P *1/10*
U.S. Cl. 318—487 **6 Claims**



1. A time delay control circuit comprising, a pair of input terminals, a capacitor, and a resistor arranged in series between the input terminals, a flip-flop, a first comparator connected across the resistor to set the flip-flop, a second comparator connected to one of the input terminals to reset the flip-flop, and resistance means connected across said input terminals and to each of said comparators to generate bias voltages for said comparators when voltage is applied across said input terminals, whereby the flip-flop is set in accordance with variations in the signal applied to the input terminals which are of a predetermined minimum duration established by the charging time of the capacitor.

4,030,011
MULTIMODE CONTROL SYSTEMS
Russell C. Hendrick, and John C. Larson, both of Minneapolis, Minn., assignors to Honeywell Inc., Minneapolis, Minn.
Filed Mar. 24, 1975, Ser. No. 561,381
Int. Cl.² G05B *13/00*
U.S. Cl. 318—561 **14 Claims**

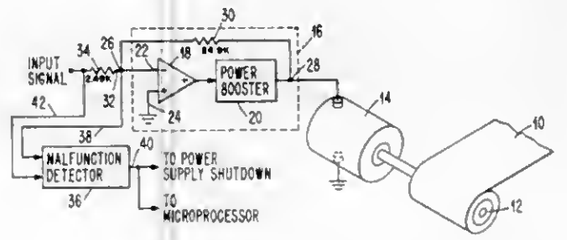


1. In a multimode control system including means for affecting physical condition in response to an input signal which is processed through nonlinear signal processing circuitry to provide more than one system response characteristic depending on input signal frequency and amplitude, the improvement which comprises:
a high pass filter;
a low pass filter;
means for supplying the input signal to said high pass and low pass filters;
an amplitude limiter;
means for supplying the output signal of one of said high pass and low pass filters to said amplitude limiter;
first summing means for additively combining the output signals of said amplitude limiter and the other said high pass and low pass filters;
second summing means for subtractively combining the input signal and the output signal of said first summing means;
first signal transfer means having a first signal response characteristic;
means for supplying the output signal of said first summing means to said first signal transfer means;
second signal transfer means having a second signal response characteristic distinct from the first signal response characteristic;
means for supplying the output signal of said second summing means to said second signal transfer means;
third summing means for combining the output signals of said first and second signal transfer means; and
means for supplying the output signal of said third summing means to the condition affecting means.

4,030,012
AMPLIFIER MALFUNCTION DETECTOR
Otto Richard Buhler, Boulder, Colo., assignor to International Business Machines Corporation, Armonk, N.Y.
Filed June 23, 1975, Ser. No. 589,100
Int. Cl.² H02H *3/28*
U.S. Cl. 318—565 **11 Claims**

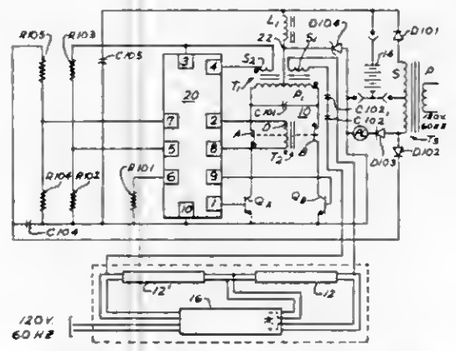
1. Apparatus for detecting malfunction in a power amplifier comprising:
amplifier means;
control means for producing a controlled signal to drive said amplifier;

malfunction means operably connected to said control means for summing a plurality of signals;
feedback means operably connected for feeding back a signal from the output of the amplifier to the malfunction means;



compare means to compare the signal from the malfunction means with reference signals; and
means for outputting an error signal indicative of the amplifier malfunction when the range of reference signals is exceeded.

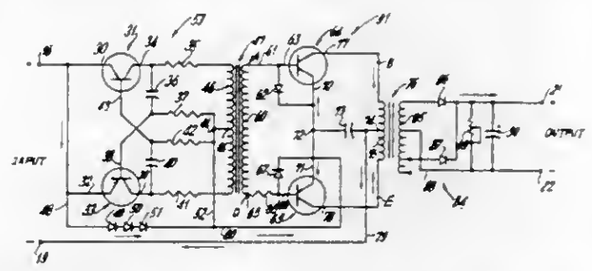
4,030,013
EMERGENCY LIGHTING SYSTEM AC LINE VOLTAGE SENSING
Donald L. Watrous, Liverpool, N.Y., assignor to General Electric Company, Carmel, Ind.
Division of Ser. No. 534,660, Dec. 19, 1974, Pat. No. 3,921,005. This application Aug. 25, 1975, Ser. No. 607,487
Int. Cl.² H05B *37/04*
U.S. Cl. 320—59 **4 Claims**



1. In an emergency lighting system having a high reactance transformer with a primary winding adapted for coupling to an AC energy source and a secondary winding, circuit means for monitoring the AC source voltage comprising:
means for coupling the secondary winding of the transformer with a non-linear load during one half cycle of the AC source voltage; and
means for coupling the transformer secondary winding with a linear load during an alternate half cycle of the AC source voltage to provide DC voltage proportional to the AC source voltage.

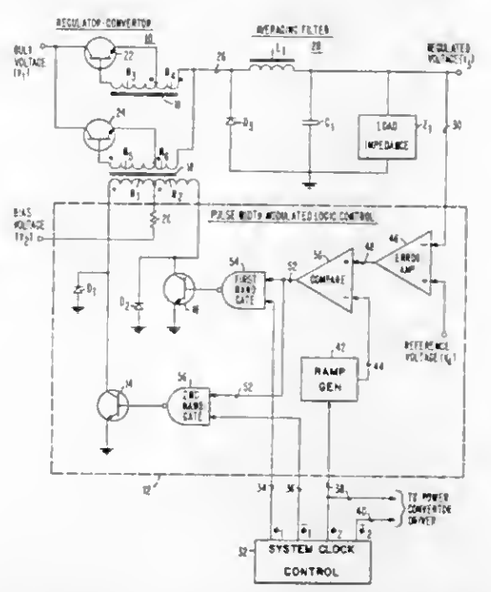
4,030,014
CURRENT-TO-CURRENT ELECTRICAL ISOLATOR
Maghar S. Chana, Rochester, and Eli Leonard Garelick, Henrietta, both of N.Y., assignors to Rochester Instrument Systems, Inc., Rochester, N.Y.
Filed Apr. 25, 1975, Ser. No. 571,586
Int. Cl.² H02M *3/335*
U.S. Cl. 321—2 **7 Claims**

1. A current-to-current isolator adapted to be utilized between a transmitter and a control room instrument and to be powered by the current signal from the transmitter and without another power source, said isolator comprising:
a pair of input terminals and a pair of output terminals;
a master oscillator means which is a push-pull chopper and connected to the first input terminal;
a first transformer whose primary winding has a center tap and two end taps;
a voltage reference means providing a voltage drop connected between said first input terminal and said center tap, the said center tap and the said taps being connected to said master oscillator;



a slave oscillator means connected to the secondary of said first transformer and whose frequency is controlled by said master oscillator;
a current transformer whose primary winding has a center tap and two end taps, said center tap being connected to the second input terminal and the end taps being connected to said slave oscillator means; and
full wave rectifying and filtering means being connected between the secondary of said current transformer and said output terminals.

4,030,015
PULSE WIDTH MODULATED VOLTAGE REGULATOR-CONVERTER/POWER CONVERTER HAVING PUSH-PUSH REGULATOR-CONVERTER MEANS
Joseph Michael Herko, and James Maurice Joyce, both of Boca Raton, Fla., assignors to International Business Machines Corporation, Armonk, N.Y.
Filed Oct. 20, 1975, Ser. No. 624,217
Int. Cl.² H02P *13/32*
U.S. Cl. 321—2 **3 Claims**



1. A regulator-converter for regulating a bulk voltage to a maximum regulated output voltage comprising, in combination:
clock means for generating first, second and third clock pulses at first, second and third outputs, respectively, of said clock means, said first clock pulse being at a frequency (F), said second clock pulse being at a frequency

(F) and 180° out phase with said first clock pulse and said third clock pulse being at a frequency (2F);

control means being driven by said first, second and third clock pulses and responsive to a ripple voltage on said regulated output voltage for generating, alternately, pulse width modulated control voltages at a frequency (F) at first and second outputs;

regulator means having a first input operably connected to said first output of said control means, a second input operably connected to said second output of said control means and a third input connected to said bulk voltage for providing a switched voltage at a frequency (2F) at its output substantially equal in amplitude to said bulk voltage and in response to said amplified pulse width modulated control voltages at a frequency (F);

said regulator means being comprised of a regulator interstage transformer having one end of a primary winding connected to said first output of said control means, the other end of said primary winding connected to said second output of said control means and a center tap connected by means of a current limiting resistor to a bias voltage, and said regulator interstage transformer having first and second secondary winding;

a first regulator power transistor having its collector connected to said bulk voltage, its base connected to one end of said first secondary winding and its emitter connected to a tapped winding; and

a second regulator power transistor having its collector connected to said bulk voltage, its base connected to one end of said second secondary winding and its emitter connected to a tapped winding, the other end of said first secondary winding being connected to the other end of said second secondary winding thereby forming said output of said regulator means; and

averaging filter means connected to said output of said regulator means for filtering said switched voltage providing at its output a regulated voltage approximating said bulk voltage.

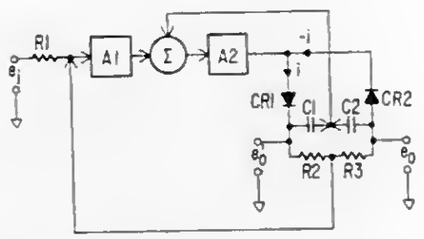
PRECISION ACTIVE RECTIFIER CIRCUIT

Joe E. Marriott, Loveland, Colo., assignor to Hewlett-Packard Company, Palo Alto, Calif.

Filed Mar. 26, 1976, Ser. No. 670,805

Int. Cl.² H02M *7/00*

U.S. Cl. 321—8 R **8 Claims**



1. A stable high speed switching circuit having feedback loops, the circuit comprising:

a first amplifier having an input and an output;

a second amplifier having an input connected to the output of first amplifier and having an output;

a first compensating feedback loop comprising a first non-linear switching component serially coupled to a first capacitor, the first non-linear switching component having a first terminal connected to the output of said second amplifier and a second terminal connected to a first terminal of the first capacitor, the first capacitor having a second terminal connected to the input of said second amplifier; and

an outer feedback loop comprising a first impedance having a first terminal connected to the second terminal of the first non-linear switching component, and having a second terminal connected to the input of the first amplifier.

4,030,017

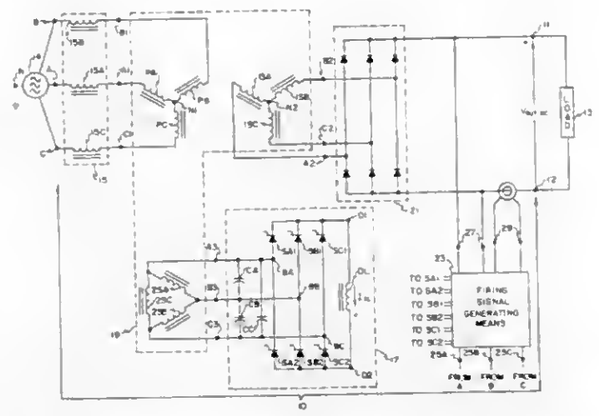
CONTROLLED REACTANCE REGULATOR CIRCUIT

Harold J. Brown, Lorain, Ohio, assignor to Lorain Products Corporation, Lorain, Ohio

Continuation-in-part of Ser. No. 546,554, Feb. 3, 1975, Pat. No. 3,983,469. This application Jan. 6, 1976, Ser. No. 646,973

Int. Cl.² H02M *7/155*; **G05F** *1/30*

U.S. Cl. 321—9 R **36 Claims**



18. A voltage regulator circuit comprising, in combination, a circuit input for connection to a polyphase a-c source, a circuit output for connection to a load, polyphase line inductance means for supporting the difference voltages between a polyphase a-c voltage at the circuit input and a desired voltage at the circuit output, a transformer having a set of polyphase primary windings, having a first set of polyphase secondary windings and having a second set of polyphase secondary windings, means for connecting the first set of secondary windings to the circuit output, at least three capacitors connected to one another in a closed circuit path, the sum of the voltages around said path being substantially equal to zero, means for connecting the capacitors to the second set of secondary windings, controllable discharging means for controllably conducting a recurring sequence of resonant discharge current pulses through the capacitors, each resonant discharge current pulse having a resonant discharge frequency of from three to ten times the frequency of the voltage at the circuit input, and control means for setting the phase relationship between the resonant discharge current pulses and the voltages at the circuit input, in accordance with the voltage at the circuit output, to maintain the desired voltage at the output, said capacitors and said controllable discharging means cooperating, under the control of the control means, to induce across the line inductance means voltages which add to the input voltages when the combined effective impedance thereof is capacitive and which subtract from the input voltages when the combined effective impedance thereof is inductive.

POWER CONVERTER SYSTEM

Takashi Tsubol, Katsuta, Japan, assignor to Hitachi, Ltd., Japan

Filed Jan. 13, 1976, Ser. No. 648,675

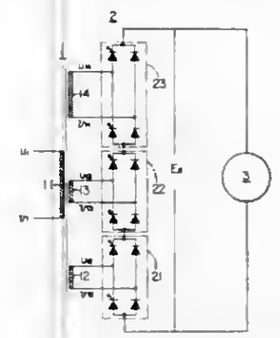
Claims priority, application Japan, Jan. 16, 1975, 50-6362

Int. Cl.² H02M *7/00*

U.S. Cl. 321—27 R **5 Claims**

1. A power converter system for converting an AC voltage into a DC voltage, comprising a transformer means provided with a primary winding connected to an AC power source and a secondary winding divided into a plurality of sets of coils; and rectifier means including a plurality of rectifier circuits, each of said rectifier circuits including controlled rectifier

elements and having AC and DC terminals, said AC terminals of each rectifier circuit being connected to the corresponding one of the sets of secondary coils, said DC terminals of said respective rectifier circuits being connected in series to produce a DC output voltage from said rectifier means, predetermined one of said rectifier circuits being adapted to control its DC output voltage sequentially and cyclically in a plurality of steps of generating the DC output voltage from said rectifier means, the remaining rectifier circuits being adapted to control their DC output voltages in an on-off fashion in said steps, said steps being switched over by on-off controlling said remaining rectifier circuits for on-off control when the DC output voltage of said predetermined one of said rectifier circuits reaches an ultimate value in each cycle; the improvement wherein the value of the DC output voltage from said rectifier means when the DC output voltage of said predetermined one of said rectifier circuits reaches said ultimate value is selected to be higher than the value of the DC output voltage from said rectifier means when the next step commences.



4,030,019

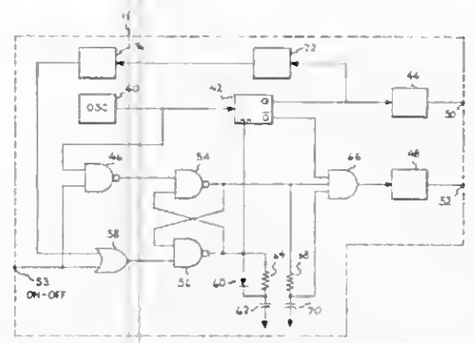
STATIC INVERTER CONTROL CIRCUIT

Ronald Barry Bailey, Erie, Pa., assignor to General Electric Company, Erie, Pa.

Filed Nov. 10, 1975, Ser. No. 630,733

Int. Cl.² H02M *7/515*

U.S. Cl. 321—45 R **4 Claims**



1. In a complementary impulse commutated inverter circuit of the type including first and second controllable switching means connected in alternate load current carrying paths between a DC power source and an inductive load, an improved control circuit including means for producing gating signals having a predetermined normal time duration, said control circuit having first and second output terminals and an input terminal, said first and second output terminals being connected to control terminals of said controllable switch means, said input terminal being connected to receive an inverter enable command signal said control circuit comprising:

a. means responsive to said enable command signal for initially supplying a first gating signal to a predetermined one of said controllable switching means and for thereafter supplying subsequent gating signals alternately to both of said controllable switching means;

b. means responsive to the removal of said enable command signal for causing a last gating signal to be applied to said predetermined one of said controllable switching means; and

c. means for prematurely terminating said last gating signal so that said last gating signal is of a subnormal duration.

INVERTER

Masahiko Akamatsu, Amagasaki, Japan, assignor to Mitsubishi Denki Kabushiki Kaisha, Tokyo, Japan

Division of Ser. No. 513,472, Oct. 9, 1974, Pat. No. 3,942,094, which is a continuation-in-part of Ser. No. 387,700, Aug. 13, 1973, abandoned, which is a continuation-in-part of Ser. No. 199,190, Nov. 16, 1971, abandoned. This application Nov. 19, 1975, Ser. No. 633,548

Int. Cl.² H02M *7/515*

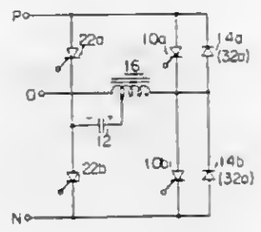
U.S. Cl. 321—45 C **12 Claims**

1. An inverter circuit comprising:

at least two semiconductor controlled rectifier means operatively connected between a source of direct current and

an AC load to provide an output current with alternating polarity;

a series combination of a commutation capacitor and a primary winding of a transformer connected across said semiconductor controlled rectifier means for applying reverse bias to said semiconductor rectifier means on commutation;



a respective first semiconductor unidirectional conductive element connected in anti-parallel with each of said semiconductor controlled rectifier means to pass reverse current on commutation; and

means for controlling the charging and discharging currents of said commutation capacitor flowing through said primary winding of said transformer with the output current having the alternating polarity and flowing through a secondary winding of said transformer.

4,030,022

PHASE-CONTROLLED CYCLOCONVERTERS

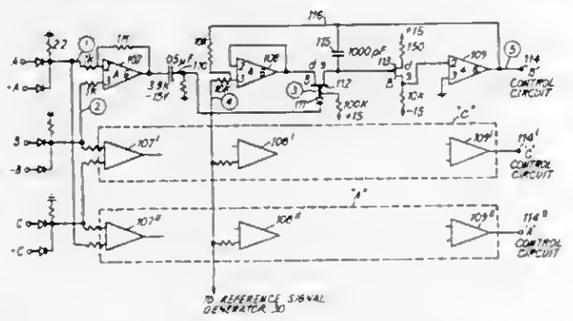
Brian Michael Bird, Bristol, England, assignor to National Research Development Corporation, England

Filed May 29, 1975, Ser. No. 581,755

Claims priority, application United Kingdom, June 3, 1974, 24430/74

Int. Cl.² H02M 5/27

U.S. Cl. 321—69 R **9 Claims**



1. A method of control of switching means for cycloconverter apparatus, for converting electrical power from an input, 3-phase alternating current supply of input frequency to an output, alternating current supply of output frequency different from said input frequency, said method comprising generating a sinusoidal reference wave of said output frequency for each phase of said output supply, sampling the amplitude of each said reference wave at the instants of amplitude equality of each pair of the input supply phases, storing the value of each sampled amplitude during the next following 180°, at supply frequency, to provide a modified reference wave of step-form amplitude, and providing a conduction initiating pulse for said switching means at each amplitude equality of each said modified reference wave and each input supply wave so as to control current conduction by said switching means and thus control the current flow from each of the input supply phases.

4,030,023

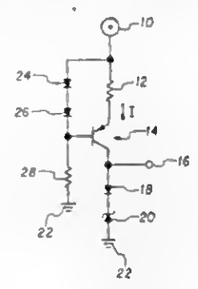
TEMPERATURE COMPENSATED CONSTANT VOLTAGE APPARATUS

John L. Keith, Garland, Tex., assignor to Rockwell International Corporation, El Segundo, Calif.

Filed May 25, 1976, Ser. No. 689,877

Int. Cl.² G05F 1/58

U.S. Cl. 323—4 **2 Claims**



1. Temperature compensated constant voltage apparatus comprising, in combination:

power supply means including first and second terminal means;

transistor means including base, emitter and collector means;

first resistive means connected between said first terminal means and said base means;

apparatus output means connected to said collector means for outputting a constant voltage;

second resistive means connected between said emitter means and said second terminal means;

first diode means, comprising two diodes connected in series each having the same direction of easy current flow, connected between said base means and said second terminal means; and

second diode means, including at least a zener diode and a further diode having a direction of easy current flow opposite that of the zener diode, connected between said collector means and said first terminal means.

4,030,024

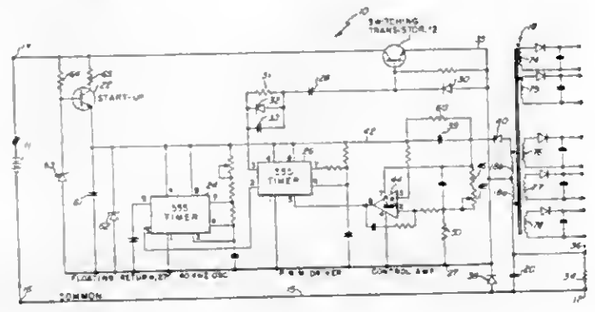
SWITCHING POWER SUPPLY WITH FLOATING INTERNAL SUPPLY CIRCUIT

Derek Chambers, Bedford, and Dee Wang, Londonderry, both of N.H., assignors to Raytheon Company, Lexington, Mass.

Filed July 2, 1976, Ser. No. 702,177

Int. Cl.³ H02M 7/217, 7/515

U.S. Cl. 323—17 **14 Claims**



1. A power supply, a pair of input terminals for connection to a source of direct current, a pair of output terminals for connection to a load, a choke coil comprising first and second windings, one end of which is connected to one of said output terminals, the other of said output terminals forming a common lead to one of said input terminals, a switching transistor coupled from a common point of said first and second windings to the other of said input terminals, a free-wheeling diode connected from said common point to said common lead and adapted to conduct during OFF periods of said switching

transistor and poled in a direction to provide a current path for said first winding, a first lead forming a common terminal for a plurality of floating power supply elements also connected to said common point, said floating power supply elements connected between said first lead and a second lead and connected by way of a rectifier diode to the other end of said first and second windings, said floating power supply elements including a voltage reference source, and means for comparing the voltage from said voltage reference source with the voltage from said rectifier diode as provided by said second lead, thereby to produce a differential voltage, and means for translating said differential voltage into pulses of varying widths for application to the floating control electrode of said switching transistor.

4,030,025

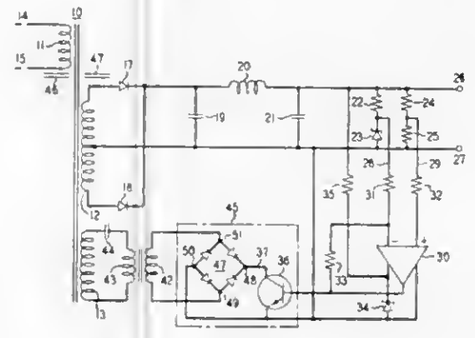
FERRORESONANT REGULATOR WITH SUPPLEMENTARY REGULATION THROUGH WAVEFORM CONTROL

Robert John Kakalec, Madison, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Feb. 20, 1976, Ser. No. 659,696

Int. Cl.² G05F 1/64

U.S. Cl. 323—61 **8 Claims**



4. A voltage regulator comprising:

a ferroresonant transformer including an input winding and an output winding,

a ferroresonant capacitor and a linear inductor connected in series and coupled to said output winding,

a peak voltage detector coupled to said output winding,

means for monitoring an output voltage of said peak voltage detector including means for generating an error signal respresentative of a deviation of the output voltage from a regulated value,

means for linearly varying the quality of said linear inductor in response to said means for monitoring including a linearly variable impedance coupled in shunt with said linear inductor, an impedance of said variable impedance being responsive to said error signal.

4,030,026

SAMPLING METAL DETECTOR

George Calvin Payne, Tempe, Ariz., assignor to White's Electronics, Inc., Sweet Home, Oreg.

Filed Nov. 25, 1974, Ser. No. 526,678

Int. Cl.² G01V 3/10; G01R 33/02

U.S. Cl. 324—3 **20 Claims**

1. A sampling metal detector comprising:

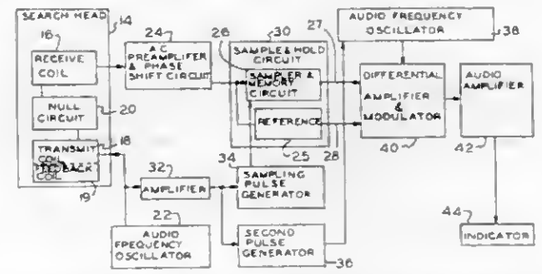
transmit coil means;

receive coil means;

search head means for enclosing and supporting said transmit coil means and said receive coil means in such a manner as to enable the detection of metal objects in an unabservable position external to the search head;

a first oscillator coupled to said transmit coil for transmitting a sinusoidal oscillator signal through said transmit coil to produce a changing electromagnetic field in the region of said search head means and cause a received signal to be induced in said receive coil during the transmission of said oscillator signal when a metal object is within the portion of said electromagnetic field which is external to said coil means and said search head means thereby enabling the detection of the metal object, said received signal including a mineral soil signal component when said metal object is located in mineralized soil;

sampling pulse generator means for producing sampling pulses at a time related to the output signal of said oscillator, said sampling pulses having a pulse width less than one cycle of said received signal and having a faster rise time than the oscillator signal;



sampling means coupled to the output of said sampling pulse generator means and having its input connected to the output of said receive coil means, for sampling said received signal at a position on its waveform where the mineral soil signal component of said received signal is of a minimum amplitude for a time period corresponding to the width of the sampling pulse to produce an output sample voltage corresponding to the sampled portion of one cycle of the received signal; and

output means for producing an output signal corresponding to a selected component of the received signal in response to the output sample voltage.

4,030,027

APPARATUS FOR NON-CONTACT MEASUREMENT OF DISTANCE FROM A METALLIC BODY USING A DETECTION COIL IN THE FEEDBACK CIRCUIT OF AN AMPLIFIER

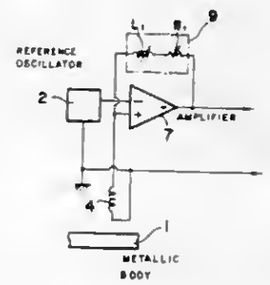
Takeo Yamada; Seigo Ando, both of Yokohama, and Katsujiro Watanabe, Tokyo, all of Japan, assignors to Nippon Kokan Kabushiki Kaisha, Tokyo, Japan

Filed Oct. 30, 1975, Ser. No. 627,463

Claims priority, application Japan, Nov. 6, 1974, 49-127048; Mar. 25, 1975, 50-34929

Int. Cl.³ G01R 33/12

U.S. Cl. 324—34 D **6 Claims**



1. Apparatus for measuring the distance between a detecting coil and a metallic body mounted in opposition thereto, said apparatus comprising a differential amplifier having positive and negative input terminals, a reference oscillator connected to the negative input terminal of the amplifier, a feedback circuit connected to the positive input of said differential amplifier, said feedback circuit incorporating said detecting coil such that amplified AC signals from said reference oscillator are applied to the detecting coil through said feedback

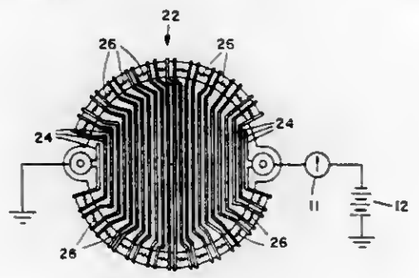
circuit, the amplified differential output signal between said AC signals applied to said differential amplifier and the signal also supplied to said differential amplifier and resulting from the impedance of the detecting coil corresponding to the distance between the detecting coil and the metallic body being thus a measure of said distance; at least one of the parameters of open-loop gain of the differential amplifier and the impedance of the feedback circuit being pre-determined so as to linearize at least for a pre-determined measuring range the output characteristics of said differential amplifier originating from the variation of the detecting coil impedance caused by the variation of said distance.

4,030,028

METHOD OF AND APPARATUS FOR DETECTING CONDUCTIVE PARTICLES IN AN OIL FLOW SYSTEM

David G. Allender, 23A - 12th Ave., San Mateo, Calif. 94402

Filed Aug. 13, 1975, Ser. No. 604,307
Int. Cl.² G01R *27/02*
U.S. Cl. 324—65 R **20 Claims**



1. The method of sensing the presence and quantity of conductive materials in a flow system for high electrical resistance fluid comprising the steps of:

a. positioning an electrically insulating substrate having a major surface with a plurality of elongated close spaced substantially parallel electrically conductive surfaces thereon below the normal level of fluid at a point in said system where the fluid flow is relatively static whereby conductive materials having a higher specific gravity than said fluid may contact said major surface of said substrate;

b. electrically connecting each of said elongated conductive surfaces at the junction between a different pair of a plurality of series connected electrical resistance elements providing a given total electrical resistance;

c. electrically isolating said plurality of series connected electrical resistance elements from said fluid of said flow system;

d. passing a given electrical current flow through said series connected electrical resistance elements; and

e. sensing effective decreases in said given total electrical resistance due to conductive materials which contact said substrate in a position to bridge the space between adjacent ones of said elongated close spaced substantially parallel conductive surfaces thereon.

4,030,029

HARNESS ASSEMBLY TEST SYSTEM

C. Eugene Cox, 2738 W. Strawberry Lane, Santa Ana, Calif. 92701

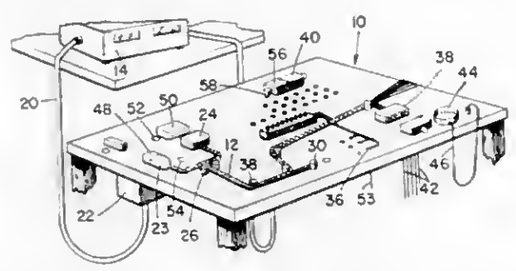
Filed Aug. 14, 1975, Ser. No. 604,821
Int. Cl.² G01R *31/02, 19/16*
U.S. Cl. 324—66 **21 Claims**

1. The method of making a wiring harness of the kind in which each conductor of a group of conductors, each having a first end and a second end, is to extend from a respectively associated first place at which a respectively associated electrically conductive element is located to a respectively associated second place at which a respectively associated electrically conductive element is located, which method comprises the steps of:

applying an initiating signal to the electrically conductive element at one of said first places;

sequentially examining the conductive elements at said first places for the presence of an initiating signal;

terminating said sequential examination upon finding a conductive element at a first place which is subjected to an initiating signal;



providing an indication to identify the second place associated with the first place which is subjected to said initiating signal; and

terminating said initiating signal and said indication by completing connection of said one conductor such that its first end is connected to the conductive element at the first place at which the initiating signal appeared and such that its second end is connected to the conductive element at the associated second place.

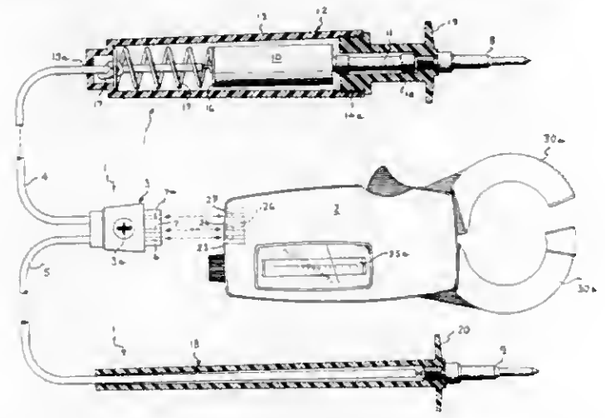
PROBE ASSEMBLY FOR AN ELECTRIC METER

Carl F. Van Bennekom; Donald R. Hyer, both of Lynnfield, and Warren N. Kernander, Boxford, all of Mass., assignors to General Electric Company, Schenectady, N.Y.

Filed Feb. 4, 1976, Ser. No. 655,315
Int. Cl.² G01R *31/02*
U.S. Cl. 324—72.5 **7 Claims**



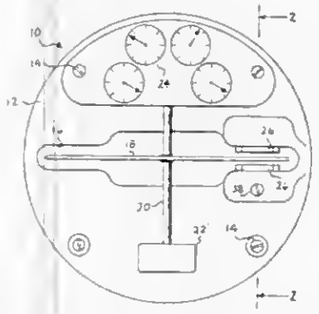
1. A probe assembly for use with a meter that is operable to measure electrical current or voltage and adaptable with said assembly to measure electrical resistance, comprising, an insulated multi-terminal plug housing, first and second flexible, insulated electrical conductors, first and second electrical probes, a plurality of terminals mounted in said plug housing, a resistor and a potentiometer, the ends of said first conductor being electrically connected, respectively, to said first probe and to one terminal in said plug housing, the ends of the second conductor being electrically connected, respectively, to said second probe and to another terminal in said plug housing, said potentiometer being electrically connected in series with one of said flexible conductors and the terminal to which it is connected and said resistor being electrically connected between the first and second flexible conductors, a fuse and a battery electrically connected in series with the other of said flexible conductors, said probes being manually movable into engagement with spaced points of an electrical conductor to measure the resistance thereof responsive to said battery establishing a potential difference between the probes whereby said potential difference is applied across the terminals connected, respectively, to the first and second probes, and said potentiometer being operable to adjust the meter to indicate full scale deflection when the first and second probes are placed in engagement with each other.

4,030,031

MAGNETIC DAMPING SYSTEM FOR INDUCTION WATTHOUR METERS

Harold Lloyd Stucker, Somersworth, N.H., assignor to General Electric Company, New York, N.Y.

Filed Sept. 10, 1975, Ser. No. 612,122
Int. Cl.² G01R *11/14, 11/10*
U.S. Cl. 324—152 **10 Claims**



1. In an induction watthour meter including a rotatably mounted electroconductive disk armature driven by alternating flux fields produced by an alternating current electromagnet, a magnetic damping system for said disk armature comprising a counterposed pair of predeterminedly spaced damping magnet units with each unit positioned adjacent opposite sides of the disk armature and opposite the other, said magnet units each comprising an assemblage including a non-permanent magnet bridge member for conducting magnetic flux, a cobalt-rare earth permanent magnet affixed to the bridge member, and a non-permanent magnet projection member for conducting magnetic flux on said bridge member extending in spaced symmetrical relationship with and in the same direction as said magnet and being of approximately the same dimensions as the magnet, the unlike poles of said permanent magnets and said non-permanent magnet projection members for conducting magnetic flux each being aligned with its respective counterpart on the opposite side of the interposing disk armature whereby a closed loop magnetic flux field is established through the counterposed pair of damping magnet units and passes twice and in opposite directions through the interposed disk armature.

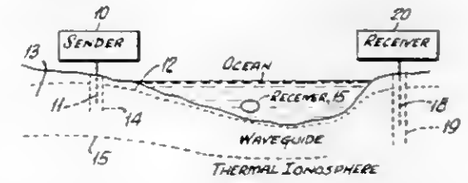
4,030,032

RADIO TRANSMISSION SYSTEM

Harold A. Wheeler, Great Neck, N.Y., assignor to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Apr. 5, 1960, Ser. No. 20,100
Int. Cl.² H04B *13/02*
U.S. Cl. 325—28 **8 Claims**

1. A method of radio transmission comprising radiating electromagnetic waves in the earth's crust through a "deep wave guide" formed of basement rock bounded on its upper side by a surface layer of sufficient conductivity to form the upper boundary of the wave guide and bounded on its lower side by a region having a temperature of several hundred degrees Centigrade, which temperature causes the lower region to have a conductivity which is high relative to that of the basement rock.

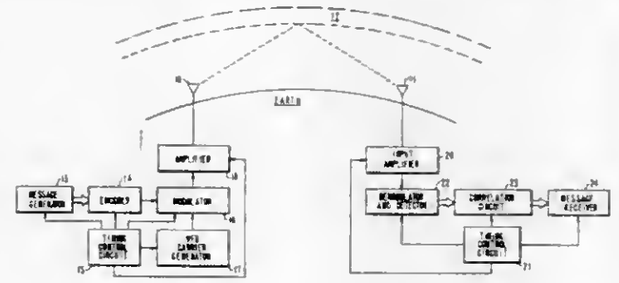


4,030,033

METHOD AND APPARATUS FOR TRANSMITTING MESSAGES TO AND FROM REMOTE LOCATIONS

Klaus Bibl, Belmont, and Bodo W. Reinisch, Bedford, both of Mass., assignors to Lowell Technological Institute Research Foundation, Lowell, Mass.

Filed June 13, 1975, Ser. No. 586,538
Int. Cl.² H04B *7/02*
U.S. Cl. 325—30 **14 Claims**



1. A communications system for transmitting a message including a plurality of characters through a highly noisy, variable delay propagation medium, said system comprising:

A. a modulated carrier wave transmitter including:

i. means responsive to each message character for establishing a corresponding multiple-bit phase code sequence,

ii. means for generating a carrier wave which shifts from one frequency to another, and

iii. means for phase-modulating the carrier wave in response to the phase code sequence thereby to transmit the modulated carrier wave with frequency diversity dependent upon the carrier wave frequency shifts to the propagation medium, and

B. a receiver for recovering from the propagation medium the transmitted message, said receiver including:

i. means for generating a carrier wave that shifts in frequency in synchronism with the carrier wave frequency shifts at said transmitter,

ii. input means for generating a demodulated signal in response to the signal from said incoming modulated carrier wave,

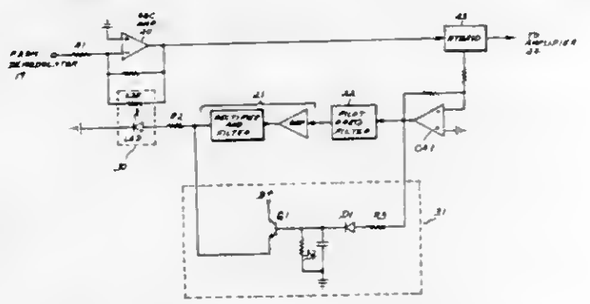
iii. detecting means for decoding the demodulated signal into a sequence of vector signals representing different predetermined range delays of the signal through the propagation medium, and

iv. correlation means for generating a message character based upon the correlation of the detected vector signals and the multiple bit phase code sequences.

4,030,034
OVERDRIVE PROTECTION CIRCUIT FOR POWER LINE CARRIER SYSTEMS AND THE LIKE

Eugen H. Ruegg, Lynchburg; Va., assignor to General Electric Company, Lynchburg, Va.

Filed Jan. 30, 1976, Ser. No. 653,716
Int. Cl.² H04B 1/16
U.S. Cl. 325—319 **5 Claims**

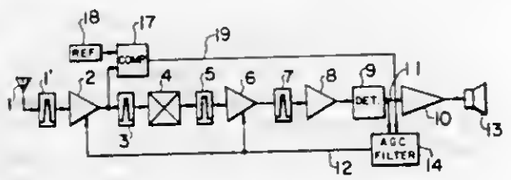


1. An improved gain control circuit for use with an arrangement having:
   a. a first amplifier having an input for a band of signals including a pilot frequency signal, having a gain control terminal for controlling the gain of said first amplifier, and having an output;
   b. a gain control loop comprising an input terminal connected to said first amplifier output, a second amplifier having its input connected to said gain control loop input terminal, a filter for said pilot frequency signal connected to the output of said second amplifier, and means connecting said pilot filter output to said gain control terminal of said first amplifier for varying the gain of said first amplifier as an inverse function of the magnitude of said pilot frequency signal; and
   c. said improved gain control circuit comprising biasing means connected to said connecting means of said gain control loop for producing a bias signal in response to said pilot frequency signal exceeding a selected magnitude, and means connected between the output of said second amplifier and said connecting means of said gain control loop for varying the gain of said first amplifier as an inverse function of the magnitude of said band of signals, said biasing means of said improved gain control circuit rendering said improved gain control circuit inoperative in response to said bias signal.

4,030,035
CIRCUIT FOR PREVENTING OUTPUT CLIPPING OF R.F. STAGE IN RADIO RECEIVER

Masanori Ienaka, Fuchu; Yasuo Kominami, Kokubunji; Yukio Suzuki, Hinode, and Masami Kawamura, Kodaira, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Sept. 29, 1975, Ser. No. 617,638
Claims priority, application Japan, Oct. 2, 1974, 49-112786
Int. Cl.² H04B 1/16
U.S. Cl. 325—404 **6 Claims**

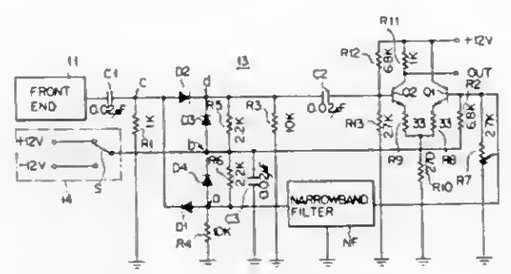


1. In a receiver including in cascade a radio frequency amplifier stage, a frequency converter stage, an intermediate frequency amplifier stage and a detector, and AGC filter means for automatically controlling the gains of said radio frequency amplifier stage and said intermediate frequency amplifier stage by an AGC voltage derived from the output of said detector, the improvement comprising voltage comparator means connected to the output of said radio frequency amplifier stage for effecting a comparison detection between the signal amplitude value of the output of said radio frequency amplifier stage and a reference value and for producing a control signal when the signal amplitude value of the output of said radio frequency amplifier stage becomes greater than the predetermined reference value, and means responsive to said control signal to reduce the gain of said radio frequency amplifier stage, thereby to prevent output clipping of said radio frequency amplifier stage.

4,030,036
BANDWIDTH CHANGING CIRCUIT

Kazutoshi Kusano, Mitaka, Japan, assignor to Sansui Electric Co., Ltd., Tokyo, Japan

Filed May 25, 1976, Ser. No. 689,948
Claims priority, application Japan, May 28, 1975, 50-71927[U]
Int. Cl.² H04B 1/16
U.S. Cl. 325—427 **5 Claims**



1. A bandwidth changing circuit comprising:
   a differential amplifier circuit means including first and second inputs and first and second transistors having input electrodes connected to said first and second inputs respectively and connected in differential configuration to each other, said second input being coupled to a power source to bias said second transistor conductive;
   a control voltage providing means for selectively providing first and second control voltages having different voltage levels to said first input of said differential amplifier circuit means, thereby causing, upon provision of the first control voltage, said first transistor to be biased conductive to constitute a differential amplifier circuit together with said second transistor and causing, upon provision of the second control voltage, said first transistor to be biased nonconductive;
   a wideband input signal source;
   a narrowband filter having an output coupled to said first input of said differential amplifier circuit means; and
   a switching circuit means for coupling, when said control voltage providing means provides the second control voltage to said first input of said differential amplifier circuit means, said wideband input signal source to said second input of said differential amplifier circuit means in response to said second control voltage, and coupling, when said control voltage providing means provides the first control voltage to said first input of said differential amplifier circuit means, said wideband input signal source to said first input of said differential amplifier circuit means through said narrowband filter in response to said first control voltage.

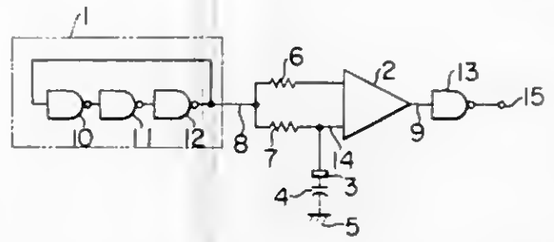
PROXIMITV DETECTING APPARATUS

Minoru Tanaka; Shoichi Mitani, both of Yokohama; Takeo Yuminaka, Katsuta; Rokuro Sasaki, Katsuta, and Hatuya Nakamura, Katsuta, all of Japan, assignors to Hitachi, Ltd., Japan

Filed Jan. 21, 1974, Ser. No. 435,268
Claims priority, application Japan, Jan. 22, 1974, 49-9649
Int. Cl.² G01V 3/10
U.S. Cl. 328—5 **10 Claims**

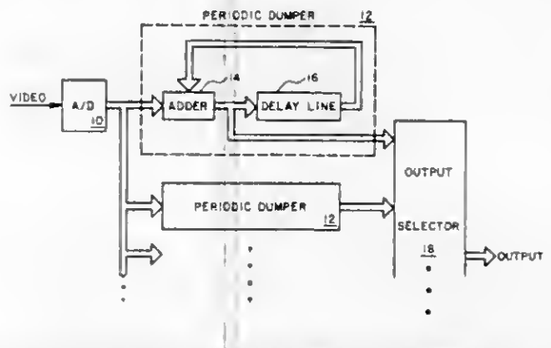


1. A proximity detecting apparatus comprising:
   an oscillator having an output terminal for generating high frequency voltage signals;
   an operational amplifier having at least two input terminals;
   at least one impedance element inserted between said output terminal of said oscillator and said input terminals for maintaining one of said input terminals at a slightly higher potential than the other input terminal; and
   a conductive metal plate connected to said one of said input terminals for forming in response to proximity of an object thereto an electrostatic capacitance between said metal plate and earth through said object.

4,030,038
MULTIPLE DUMPING INTEGRATOR

Donald D. Daniel, China Lake, and Roger V. Wilcox, Ridgecrest, both of Calif., assignors to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed Feb. 27, 1976, Ser. No. 661,916
Int. Cl.² G06G 7/18
U.S. Cl. 328—127 **3 Claims**

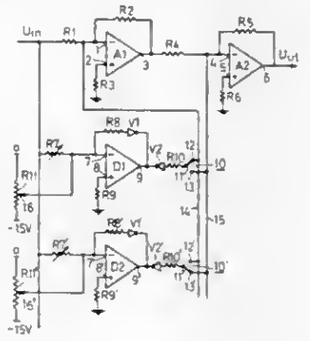


1. A multiple dumping integrator comprising:
   a source of digital signals; a plurality of periodic dumping integrators connected in parallel having a common input effectively connect to said source of digital signals and individual outputs to simultaneously integrate input data; and
   an output selector having an input connected to the outputs of said periodic dumping integrators to sequentially select each of said outputs in turn for display.

4,030,039
FUNCTION GENERATOR

Tord Fahlgren, Kolback, Sweden, assignor to ASEA Aktiebolag, Vasteras, Sweden

Filed Mar. 17, 1976, Ser. No. 667,703
Claims priority, application Sweden, Apr. 1, 1975, 7503674
Int. Cl.² G06G 7/12
U.S. Cl. 328—142 **3 Claims**

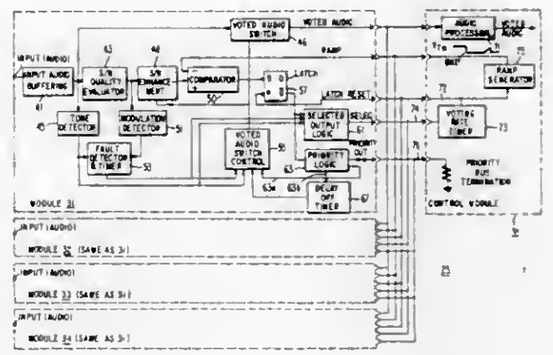


1. Function generator for generation of inverse time characteristics by approximation of the time function by means of individual, linear parts into a time function which is discontinuous at a number of break points, comprising first and second operational amplifiers, each having at least one input and at least one output the output of said first operational amplifier being connected to the input of said second operational amplifier, a plurality of amplifier circuits corresponding to the number of break points in the approximated time function, each of said amplifier circuits having at least one input and one output and operating as an ideal diode to provide a predetermined linear part of said time function, each of said amplifier circuits having said input connected to an input voltage source, and each of said amplifier circuits including selecting means for independently connecting the output thereof to the input of said first operational amplifier to decrease the derivative of the linear part of the time function generated by the respective amplifier circuit, said selecting means alternatively connecting the amplifier circuit output to the input of said second operational amplifier to increase the derivative of the linear part of the time function generated by the respective amplifier circuit.

4,030,040
RECEIVED SIGNAL SELECTING SYSTEM

Donald Duane Harbert, Prosperity, Pa., assignor to RCA Corporation, New York, N.Y.

Filed Dec. 30, 1975, Ser. No. 645,339
Int. Cl.² H04B 1/10
U.S. Cl. 328—154 **10 Claims**



1. In combination,
   signal quality detector means providing a separate control signal having a level indicative of the quality of each of a plurality of signals,

ramp signal generating means,

comparator means responsive to said control signals and to said ramp signal for providing a further control signal when the magnitudes of one of said first mentioned control signals and said ramp signal are at a given relative level, and

means responsive to said further control signal and to said plurality of signals to pass that one of said plurality of signals resulting in said last-mentioned further control signal to a utilization circuit.

4,030,041

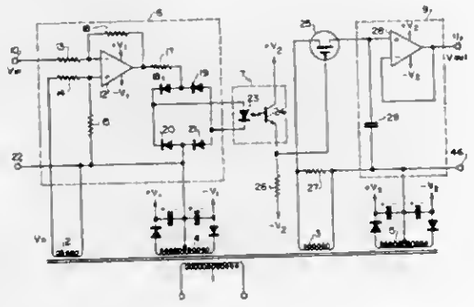
ANALOG ISOLATOR

Toshihiko Sasaki, Chigasaki, Japan, assignor to Honeywell Inc., Minneapolis, Minn.

Filed Aug. 28, 1975, Ser. No. 608,726

Int. Cl.² H03F *3/38*

U.S. Cl. 330—10 **4 Claims**



1. An analog isolator comprising:

a transformer having a primary winding arranged for connection to an A.C. power source;

a first and a second power supply secondary winding on said transformer;

a first and a second signal secondary winding on said transformer;

an input circuit arranged to be energized from said first power supply secondary winding;

input signal terminal means connected to said input circuit;

means coupling said first signal secondary winding to said input circuit;

said input circuit including means for comparing input signals applied to said input terminal means with A.C. signals induced in said first signal secondary winding and for producing a control signal derived from such comparison;

an output circuit arranged to be energized from said second power supply winding;

gating means coupling said second signal secondary winding to said output circuit; and

isolating coupling means for applying said control signal to control the operation of said gating means whereby to control the application of A.C. signals induced in said second signal secondary winding to said output circuit in accordance with said control signal;

said output circuit being responsive to said controlled application of A.C. signals from said second signal secondary winding to produce an output signal representative of the input signal applied to said input terminal.

4,030,042

FEEDBACK AMPLIFIERS

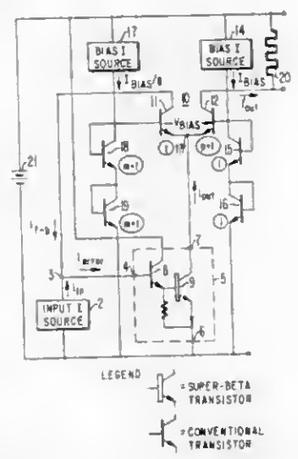
Allen LeRoy Limberg, Lambertville, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Jan. 29, 1976, Ser. No. 653,496

Claims priority, application United Kingdom, June 9, 1975, 24714/75

Int. Cl.² H03F *3/42*

U.S. Cl. 330—18 **27 Claims**



1. A feedback amplifier comprising, in combination:

a current amplifier having a signal input terminal, which is also the signal input terminal for said feedback amplifier, and an output terminal;

a current divider which includes a common terminal and first and second branch terminals, which second branch terminal is also the output terminal of said feedback amplifier, said current divider including first and second transistors, each having base and emitter and collector electrodes and being operated at substantially the same absolute temperature T, the emitter electrodes of said first and said second transistors being connected to said common terminal of said current divider and the collector electrodes of said first and said second transistors being connected respectively to said first branch terminal and to said second branch terminal, said current divider including means responsive to the temperature of said first and said second transistors for supplying a potential in fixed proportion to T, and means for applying said potential in fixed proportion to T between the base electrodes of said first and said second transistors in the poling that tends to reduce the flow of current through said first transistor as compared to the flow of current through said second transistor, the common terminal of said current divider being connected to the output terminal of said current amplifier; and

feedback circuit means connected between the first branch terminal of said current divider and the signal input terminal of said current amplifier for supplying a feedback current to said amplifier.

4,030,043

GENERALIZED OPERATIONAL AMPLIFIER

Thomas Allan Hamilton, 222 Newkirk Road, Richmond Hill, Ontario, Canada

Filed Feb. 19, 1975, Ser. No. 550,911

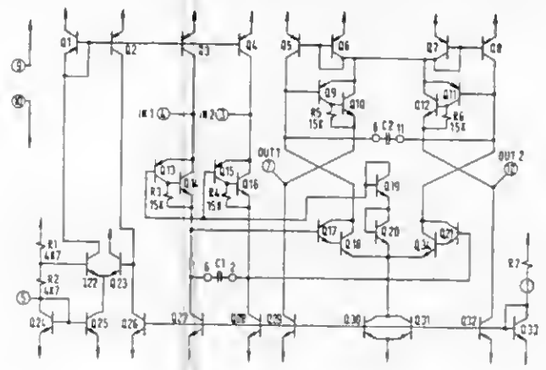
Claims priority, application United Kingdom, Feb. 20, 1974, 7761/74

Int. Cl.² H03F *3/45*

U.S. Cl. 330—30 D **10 Claims**

1. An operational amplifier comprising an input stage of first and second differential current inputs having a low input impedance connected between said inputs, a high current gain stage, an output stage of at least first and second differential current outputs, each output having at least one of each

polarity and a high output impedance connected between said first and said second differential current outputs, said high



current gain stage being interposed between said input stage and said output stage and connected to each.

4,030,044

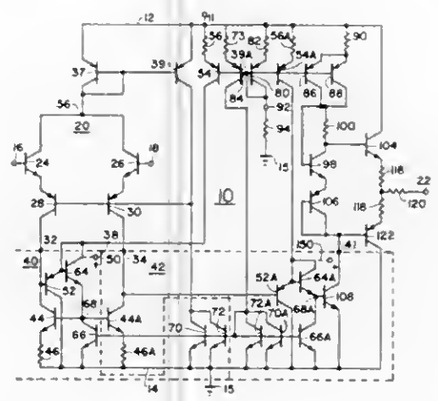
MONOLITHIC AMPLIFIER HAVING A BALANCED, DOUBLE-TO-SINGLE ENDED CONVERTER

Walter Richard Davis, Tempe, Ariz., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Nov. 13, 1975, Ser. No. 631,755

Int. Cl.² H03F *3/45*

U.S. Cl. 330—30 D **13 Claims**



11. A balanced double-to-single ended converter for transforming balanced signals occurring between the output terminals of a balanced signal supply into a single-ended output signal at an output terminal thereof, the single-to-double ended converter including in combination:

first power supply conducting means for providing a voltage of a first magnitude;

second power supply conducting means for providing a voltage of a second magnitude;

first current supply means for providing a current of a known predetermined magnitude at an output terminal thereof;

second current supply means for providing a current of said known predetermined magnitude at an output terminal thereof;

first and second circuit portions each including first, second and third signal paths, each of said first paths including a first transistor of a first conductivity type having main electrode coupled between said second power supply conductor and one of the output terminals of the balanced signal supply, each of said second paths including a transistor of a second conductivity type having main electrodes coupled between said output terminal of one of said current supply means and said second power supply conductor means and a control electrode connected to one of the output terminals of the balanced signal supply, and each of said third paths including a second transistor of said first conductivity type having main electrodes coupled between said first and second power supply conductors and a control electrode connected to one of the main electrodes of said transistor of said second conductivity type; and

first circuit means connecting the control electrodes of the first transistors of the first conductivity type of each portion together and to the second power supply conducting means.

4,030,045

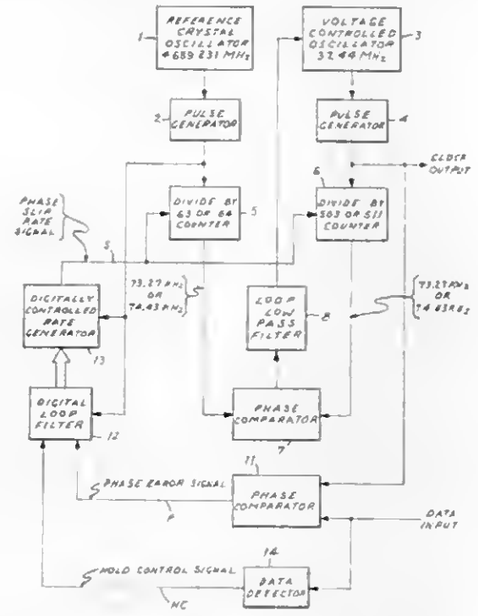
DIGITAL DOUBLE DIFFERENTIAL PHASE-LOCKED LOOP

James Monroe Clark, Cedar Grove, N.J., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed July 6, 1976, Ser. No. 702,803

Int. Cl.² H03B *3/04*

U.S. Cl. 331—1 A **30 Claims**



1. A digital double differential phase-locked loop for extraction of a bit clock from digital data comprising:

a source of digital data;

first means to provide a reference pulse train having a predetermined reference frequency;

second means including a voltage controlled oscillator to provide said bit clock having a repetition frequency locked to said repetition frequency of the bits of said digital data;

third means coupled to said first means to divide said reference frequency by a selected one of a first division factor and a second division factor different than said first division factor;

fourth means coupled to said second means to divide said repetition frequency by a selected one of a third division factor and a fourth division factor different than said first, second and third division factors;

fifth means coupled to said third and fourth means to compare the phase of the output signals of said third and fourth means and to produce a first control signal proportional to the phase difference between the output signals of said third and fourth means;

sixth means coupled to said fifth means and said second means to couple said first control signal to said voltage controlled oscillator to adjust the phase of said bit clock to lock said bit clock to the bits of said digital data; and

seventh means coupled to said source, said second means and said third and fourth means to produce a phase slip rate signal to select the appropriate one of said first and second division factors for said third mans and to select

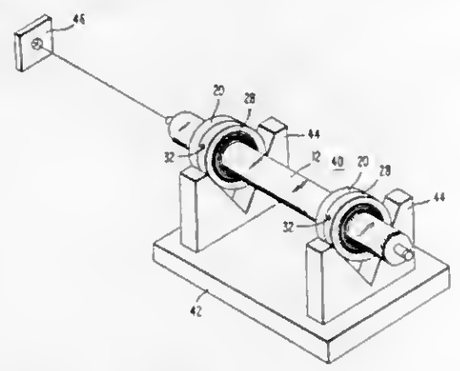
the appropriate one of said third and fourth division factors for said fourth means.

4,030,046

PREALIGNED LASER MOUNT AND METHOD OF MAKING SAME

Arthur Herbert Firester, Skillman, N.J., assignor to RCA Corporation, New York, N.Y.

Filed May 22, 1975, Ser. No. 579,968
Int. Cl.² H01S *3/03*
U.S. Cl. 331—94.5 D **4 Claims**



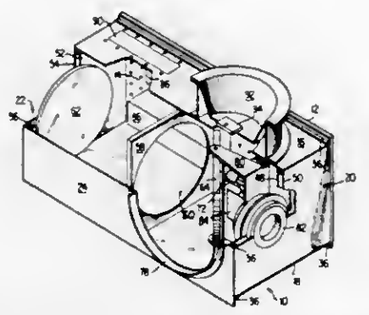
1. A gas laser discharge tube and mount comprising:
a gas laser discharge tube in the form of a closed gas confining envelope,
a first ring mount extending around the tube, the first ring mount positioned and fixedly attached to the tube near one end of the tube; and
a second ring mount extending around the tube, the second ring mount positioned and fixedly attached to the tube near the other end, the tube being in an aligned relationship with the perimeter of the first and second ring mounts.

4,030,047

OPTO-MECHANICAL SUBSYSTEM WITH TEMPERATURE COMPENSATION THROUGH ISOTHERMAL DESIGN

James C. Fletcher, Administrator of the National Aeronautics and Space Administration, with respect to an invention of Francis E. Goodwin, Malibu, Calif.

Filed Apr. 28, 1976, Ser. No. 680,957
Int. Cl.² H01S *3/02*
U.S. Cl. 331—94.5 D **10 Claims**



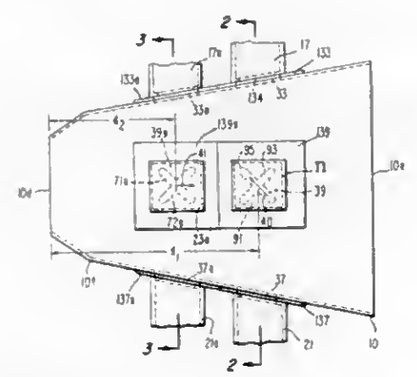
1. A thermally self compensating optical system and a mechanical support structure therefor, comprising:
housing means constructed of a selected material having a high thermal conductivity for supporting said optical system, said housing means constructed so as to minimize the existence of thermal gradients therein;
an optical system having critical focal parameters mounted within said housing, said optical system comprising optical system comprising optical elements formed of said same selected material as said housing means whereby said focal parameters are not effected by changes in temperature, said optical elements coupled both mechanically and thermally to said housing means to minimize the existence of thermal gradients therebetween.

4,030,048

MULTIMODE COUPLING SYSTEM INCLUDING A FUNNEL-SHAPED MULTIMODE COUPLER

Peter Foldes, Wayne, Pa., assignor to RCA Corporation, New York, N.Y.

Filed July 6, 1976, Ser. No. 702,402
Int. Cl.² H01P *1/16, 5/12*
U.S. Cl. 333—6 **8 Claims**



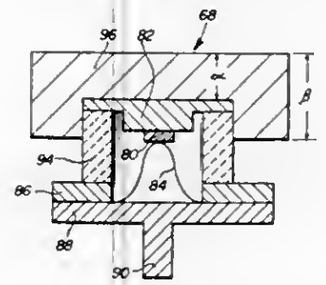
1. A multimode coupling system for coupling symmetrical waveguide mode signals at one frequency band and asymmetrical waveguide mode signals at another frequency band comprising:
a generally funnel-shaped hollow coupler with the small aperture end adapted to pass said symmetrical mode signals and reflect asymmetrical mode signals and the large aperture end adapted to be coupled to free space,
an asymmetrical mode signal terminal,
first and second sidewall coupling apertures in the tapering side wall of said coupler with said first and second side wall coupling apertures at diametrically opposite surfaces of said coupler and in a given plane orthogonal to the axis of the coupler a given distance from the small aperture end of said coupler,
third and fourth side wall coupling apertures in the tapering side wall of said coupler with said third and fourth side wall coupling apertures at diametrically opposite surfaces of said coupler equally spaced from said first and second side wall apertures and in said first given plane at said first given distance from the small aperture end of said coupler, and
coupling means including a filter-polarizer coupled between each of said first, second, third and fourth sidewall apertures and said asymmetrical mode signal terminal characterized by a response to signals at said terminal for coupling equal portions of the signal energy at the terminal to said first, second, third and fourth apertures with the phase of the coupled signals at the first and third apertures being advanced 90° relative to the phase of the signals at the second and fourth apertures,
said filter-polarizers characterized by a response to signals applied thereto at the terminal end thereof for exciting an elliptical polarized wave into the coupler, said given distance from said small aperture end of said coupler being selected together with the elliptical polarization characteristic of the filters to achieve a maximum coupling of asymmetric waveguide mode signal at a wanted polarization different from said elliptically polarized wave excited by the filter-polarizers.

4,030,049

BROADBAND LOW NOISE PARAMETRIC AMPLIFIER

David N. McQuiddy, Jr., and Truman G. Blocker, III, both of Richardson, Tex., assignors to Texas Instruments Incorporated, Dallas, Tex.

Division of Ser. No. 427,898, Dec. 26, 1973, Pat. No. 3,860,879. This application Nov. 5, 1974, Ser. No. 521,008
Int. Cl.² H03F *7/04;* **H01P** *1/20, 5/02, 5/08*
U.S. Cl. 333—33 **8 Claims**



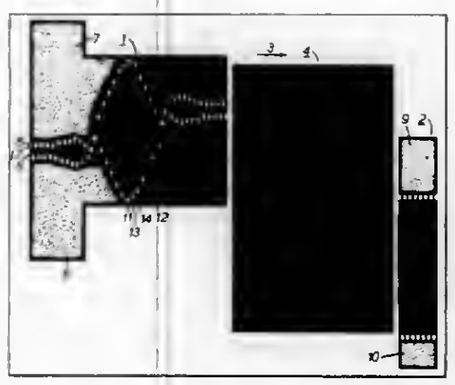
1. A varactor diode assembly for use in a parametric amplifier having a pump frequency comprising:
a varactor diode,
a conductive support for said diode,
a nonconductive spacer mounted on said support,
a conductive cap connected to said spacer remote from said support,
a conductive lead connected between said diode and said cap, and
a cup dimensioned to fit adjacent said support and having a capacitance such that the parallel resonance of said diode assembly is matched to said pump frequency.

4,030,050

ACOUSTIC SURFACE WAVE FILTERS

John Maxwell Deacon, Towcester, and James Heighway, Silverstone, both of England, assignors to Plessey Handel und Investments A.G., Zug, Switzerland

Filed Sept. 25, 1975, Ser. No. 616,689
Claims priority, application United Kingdom, Sept. 26, 1974, 41876/74
Int. Cl.² H03H *9/04, 9/06, 9/26, 9/32*
U.S. Cl. 333—72 **5 Claims**



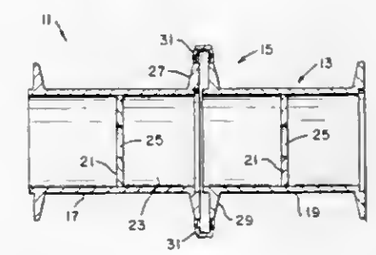
1. An acoustic surface wave filter comprising input and output transducers each having fingers of conductive material supported on a piezoelectric substrate, a pair of terminal pads to which the fingers of each transducer are electrically connected so that the fingers connected to one pad interleave with the fingers of the other pad, the transducers being mutually positionally offset in a direction orthogonal to the direction of acoustic surface wave propagation, a multistrip coupler by means of which the transducers are acoustically coupled, the spacing between adjacent fingers of at least one transducer being non-uniform, the overlap between adjacent fingers of at least one transducer being non-uniform, at least some of the fingers of at least one transducer being bifurcated so as to comprise two parts which are bridged so as to be electrically interconnected and at least some electrically connected fingers of at least one transducer being arranged to sandwich therebetween a dummy finger.

4,030,051

N-SECTION MICROWAVE RESONATOR HAVING ROTARY JOINT FOR VARIABLE COUPLING

James K. Shimizu, Palos Verdes Estates, and Richard V. Basil, Jr., Canoga Park, both of Calif., assignors to Hughes Aircraft Company, Culver City, Calif.

Filed July 6, 1976, Ser. No. 702,796
Int. Cl.² H01P *5/04, 7/06*
U.S. Cl. 333—83 R **9 Claims**



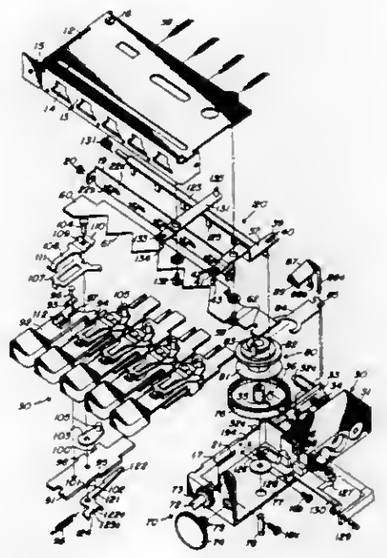
1. A microwave resonator for providing an infinitely variable coupling value over a relatively broad coupling range, comprising:
a cylindrical waveguide section having a rotating joint disposed therein;
a pair of spaced iris plates transversely disposed in said waveguide section and defining a resonant cavity section therebetween having a relatively low current density location approximately midway between said iris plates, said rotating joint being disposed in said relatively low current density location, said iris plates having centrally disposed elliptical apertures and, said iris plates being rotatable with respect to each other to provide a desired axis relationship between said elliptical apertures.

4,030,052

FLAT TUNER

Fernand Flavien Pelletier, Elmhurst, Ill., assignor to Motorola, Inc., Schaumburg, Ill.

Filed Sept. 22, 1975, Ser. No. 615,617
Int. Cl.² H03J *5/12*
U.S. Cl. 334—7 **12 Claims**



1. A pushbutton tuner comprising

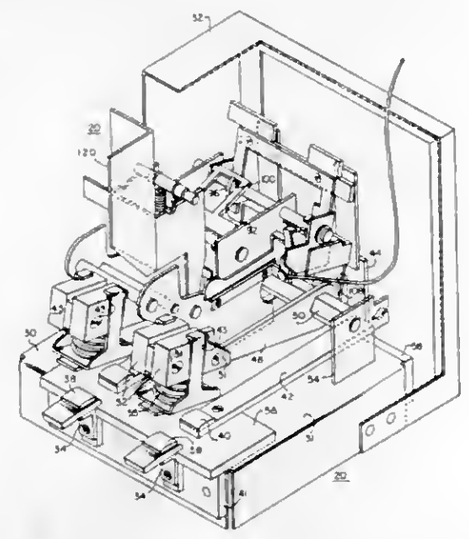
a tuner frame having a thickness dimension measured in a first plane and a width dimension measured in a second plane perpendicular to the first plane,
tuning means mounted to the frame movable to a plurality of positions representative of desired broadcast frequencies, and
a plurality of pushbutton assemblies mounted in the frame for in and out movement and each one of which carries a presettable memory cam means for recalling a memorized broadcast frequency when the one pushbutton assembly is pushed inwardly, upon actuation of a pushbutton assembly the tuning means being driven to the position corresponding to the memorized frequency of the cam carried by the actuated pushbutton
wherein the improvement comprises
slide bar means having a relatively thin dimension measured in a plane parallel to the first plane and mounted in the frame in a plane parallel to the second plane and slidable transverse the path of movement of the pushbutton assemblies for positioning the tuning means in response to driving actuation by any one of the memory cams,
a plurality of open shaped notches having cam surfaces in the slide bar aligned with the pushbutton assemblies,
the memory cam being received within its aligned open notch and engaging a cam surface thereof only when the selected pushbutton assembly carrying said memory cam is pushed in and otherwise being completely removed from its aligned open notch
inward movement of a memory cam within its aligned notch driving the slide bar transversely until the memory cam reaches the end of its travel on the engaged cam surface of its aligned notch, the slide bar and tuning means being thereby moved to the position corresponding to the memorized frequency of the actuated cam.

4,030,053

DISTRIBUTION TRANSFORMER SECONDARY CIRCUIT BREAKER HAVING CANTILEVERED CONTACTS

John F. Cotton, Athens, Ga.; Jack G. Hanks, Bethel Park, and Raymond E. Wien, Penn Township, Westmoreland County, both of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Sept. 11, 1975, Ser. No. 612,527
Int. Cl.² H01H *77/02*
U.S. Cl. 335—15 **11 Claims**



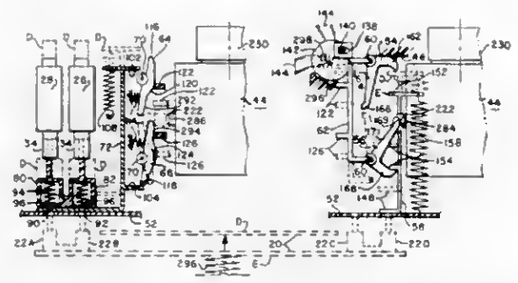
1. An oil-filled transformer having a housing with a circuit interrupter switchable between an open position wherein the electrical connections through the transformer are open and a closed position wherein the electrical connections through the transformer are closed disposed within the housing beneath the oil level comprising:
a circuit interrupter base;
a pair of stationary contacts one of which is disposed above said circuit interrupter base and the other disposed above and away from said circuit interrupter base;
bridging contact means movable between an open position spaced from said pair of stationary contacts and a closed position engaging said pair of stationary contacts completing a series circuit therethrough;
spring biasing means biasing said bridging contact means away from said pair of stationary contacts;
latching means movable between a latched position holding said bridging contact means in engagement with said pair of stationary contacts and an unlatched position allowing said bridging contact means to move away from said stationary contact means in response to said spring biasing means; and
bimetal actuating means supported from said circuit interrupter base so that transformer current flows therethrough and being cooperatively associated with said latch means to move said latch means to an unlatched position when current flow exceeds a trip level.

4,030,054

PNEUMATIC TIMING ATTACHMENT FOR AN ELECTROMAGNETIC DEVICE

Rudolf H. Kiessling, Glendale, Wis., assignor to Square D Company, Park Ridge, Ill.

Filed Dec. 23, 1975, Ser. No. 643,883
Int. Cl.² H01H *7/03, 43/00*
U.S. Cl. 335—61 **11 Claims**



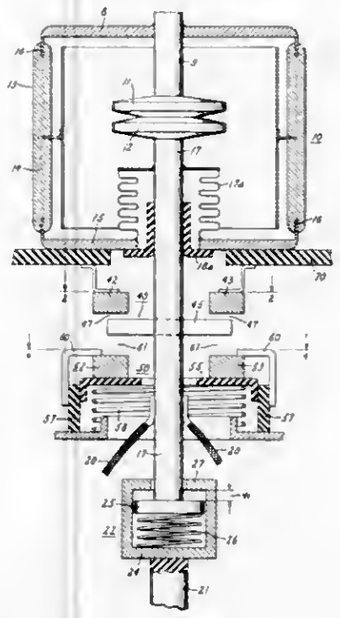
1. A timed delay device arranged for alternately providing either an ON delay or an OFF delay operation of a switch operator, comprising: a switch actuator movable between a first operated position and a second operated position for moving the switch operator from a first to a second position, a resettable timing unit having an operator movable from a reset position to a timed-out position during a regulated timed period, a first spring-biased latch having a portion releasably engaging the switch actuator for maintaining the switch actuator at its first position when the first latch is positioned in a latching position and a portion engageable with the timing unit operator for positioning the first latch in a released position when the timing unit operator is in its timed-out position, a second spring-biased latch having a portion releasably engaging the switch actuator for maintaining the switch actuator at its second position when the second latch is positioned in a latching position and a portion engageable with the timing unit operator for positioning the second latch in a released position when the timing unit is in its timed-out position, a first reset lever having a portion engageable with the timing unit operator for moving the timing unit operator to the reset position when the first reset lever is moved from a first position to a second position, a second reset lever having a portion engageable with the timing unit operator for moving the timing unit operator to the reset position when the second reset lever is moved from a first to a second position, a timing unit actuator moveable between a first position and a second position and having a portion engageable with a portion on the first reset lever for moving the first reset lever from its first position to its second position when the timing unit actuator is moved from its second position to its first position and a portion engageable with a portion on the second reset lever for moving the second reset lever from its first position to its second position when the timing unit actuator is moved from its first to its second position, and a mode selector movable to a first mode selected position and a second mode selected position and having a portion engageable with the first latch for maintaining the first latch in its released position and a portion positioning the first reset lever in its first position when the mode selector is at its first position and a portion engageable with the second latch for maintaining the second latch in its released position and a portion positioning the second reset lever in its first position when the mode selector is at its second position.

4,030,055

ELECTRIC CIRCUIT BREAKER WITH ELECTRO-MAGNETIC MEANS FOR OPPOSING MAGNETIC CONTACT-REPULSION FORCES

Peter Kotos, Havertown, Pa., assignor to General Electric Company, Philadelphia, Pa.

Filed Feb. 27, 1976, Ser. No. 662,069
Int. Cl.² H01H *77/10*
U.S. Cl. 335—195 **6 Claims**



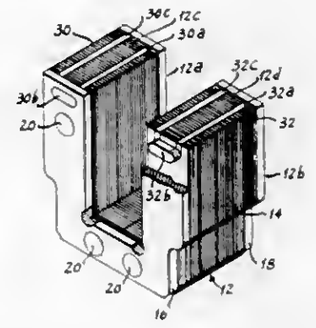
1. In an electric circuit breaker,
a. a first contact and a second contact movable into and out of engagement with said first contact,
b. a movable contact rod mechanically and electrically connected to said second contact for carrying current to and from said second contact,
c. closing-assist means for exerting on said contact rod when the contacts are engaged a magnetic hold-closed force varying in magnitude directly with current through said contact rod,
d. opening means effective during the initial portion of an opening operation for applying an impact force to said contact rod that acts to separate said contacts and to reduce the effectiveness of said closing-assist means,
e. opening-assist means effective after said contacts are separated during an opening operation for developing magnetic force acting on said contact rod in an opening direction comprising:
e_1. an armature comprising spaced segments of high permeability material fixed to opposite sides of said contact rod and projecting laterally therefrom in side-by-side relationship,
e_2. a pair of bridging members of high permeability material located at opposite sides of said contact rod and each disposed to extend between said side-by-side segments when said segments are located in proximity to said bridging members,
f. said bridging members and said segments being magnetically attracted toward each other with a force that varies in magnitude inversely with the spacing therebetween when current flows through said contact rod,
g. means mounting said bridging members for movement with said segments during the final portion of a circuit-breaker opening operation and during the initial portion of a circuit-breaker closing operation,
h. blocking means for blocking said bridging members from moving toward said segments when said contacts are engaged and for maintaining a relatively large spacing between said segments and said bridging members when said contacts are engaged,
i. said bridging members when blocked by said blocking means being positioned in the path of movement of said segments during a circuit-breaker opening operation and in such a location that the spacing between said segments and said bridging members decreases during the initial portion of a circuit-breaker opening operation.

4,030,056

CORE FOR AN ELECTROMAGNET HAVING SHADING COILS CAST IN SITU

Roman J. Patz, Wauwatosa, Wis., assignor to Cutler-Hammer, Inc., Milwaukee, Wis.

Filed Nov. 19, 1975, Ser. No. 633,389
Int. Cl.² H01F *7/10, 7/12*
U.S. Cl. 335—245 **4 Claims**



1. A laminated core assembly for an A.C. electromagnet having at least one pole face for engaging an armature, said assembly comprising a plurality of contiguously stacked magnetizable laminations flush at their ends to form said pole face, said assembly having a continuous closed-loop path therein receiving molten metal injected thereinto forming, when solidified, a cast in situ closed-loop shading coil, said coil having substantially uniform resistance due to the continuity of said metal throughout said path, at least a portion of said path extending across said ends of said laminations whereby at least a portion of said coil extends across said pole face such that minute particles of said solidified metal migrate into cracks between said laminations on said pole face after repeated engagements by said armature to provide a smoother pole face and increasing quietness of operation.

4,030,057

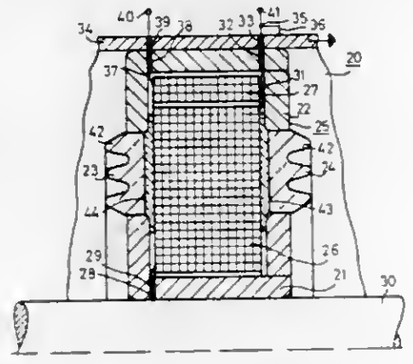
INDUCTIVE VOLTAGE TRANSFORMER

Werner Kohler, and Willi Müller, both of Berlin, Germany, assignors to Siemens Aktiengesellschaft, Munich, Germany

Continuation of Ser. No. 507,574, Sept. 19, 1974, abandoned. This application Apr. 28, 1976, Ser. No. 681,114
Claims priority, application Germany, Sept. 24, 1973, 2348397
Int. Cl.² H01F *15/02*
U.S. Cl. 336—83 **17 Claims**

1. In a metal-clad, high-voltage installation having a metal enclosure at low potential and a conductor for carrying a high

potential disposed within the metal enclosure, an inductive voltage transformer disposed between the potentials of the metal enclosure and the conductor, the inductive voltage transformer comprising: a first flux-conductive part made of electrically and magnetically-conductive material and electrically connected to the conductor of the installation; a high-voltage winding surrounding said first flux-conductive part and having a surface facing away from said flux-conductive part; a low-voltage winding arranged at said surface of said high-voltage winding; a second flux-conductive part electrically connected to the metal enclosure and made of electri-



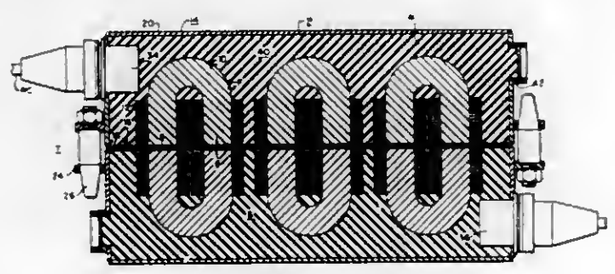
cally and magnetically-conductive material, said second flux conducting part being disposed in spaced relation to said first flux-conductive part so as to be adjacent thereto; and flux-conductive intermediate means extending between said potentials for connecting said parts together to conjointly define therewith a composite core enclosing said high-voltage and said low-voltage windings therein thereby reducing the stray inductance of said windings, said intermediate means being made of a material that is magnetically conductive while at the same time being electrically insulative thereby preventing a conductor to enclosure fault through said intermediate means during the operation of the high-voltage installation.

4,030,058

INDUCTIVE COUPLER

Delmar R. Riffe, Murrysville; Richard D. Olson, Monroeville; David M. Edison, Murrysville, and Robert J. Spreadbury, Franklin Township, Westmoreland County, all of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Mar. 30, 1976, Ser. No. 671,852
Int. Cl.² H01F 27/02
U.S. Cl. 336—92 **1 Claim**



1. An inductive coupler apparatus for connecting and disconnecting electrical power in an underwater environment, comprising:

first and second water-tight sealed stainless steel housings adapted for mechanical mating and each including a stainless steel mating wall having internal and external surfaces, each of said stainless steel mating walls being of a thickness between 0.002 and about 0.010 inches,

mechanical alignment means extending from said water-tight sealed stainless steel housing for mechanically aligning said first and second water-tight sealed stainless steel housing during mating in an underwater environment, said external surfaces of said stainless steel mating walls being aligned in intimate contact when said first and second water-tight sealed stainless steel housings are mechanically mated,

sacrificial anode means extending from at least one of said first and second water-tight sealed stainless steel housings to minimize corrosion of said housings in an underwater environment,

at least one primary transformer core section including a C-core element and corresponding pole faces and primary coil windings thereabout, said primary transformer core section being positioned within said first water-tight sealed stainless steel housing with said pole faces in ultimate contact with the internal surface of the stainless steel mating wall of said first water-tight sealed stainless steel housing,

at least one secondary transformer core section including a C-core element and corresponding pole faces and secondary coil windings thereabout, said secondary transformer core section being positioned within said second water-tight sealed housing with said pole faces in intimate contact with the internal surface of the stainless steel mating wall of said second water-tight sealed stainless steel housing, said primary and secondary transformer core sections being positioned such that the pole faces of the respective core sections are physically aligned when said first and second water-tight sealed stainless steel housings are mechanically mated to thereby complete a magnetic circuit between said primary transformer core section and said secondary transformer core section, and

fill composition filling the internal volumes of said first and second water-tight sealed stainless steel housings to provide mechanical support to enable the stainless steel mating walls to withstand the external pressure of an underwater environment.

4,030,059

FUSE

George Kwo Kiun Tong, 39, MacDonnell Road, Hong Kong

Filed June 9, 1975, Ser. No. 584,716
Int. Cl.² H01H 85/24
U.S. Cl. 337—262 **7 Claims**

1. A fuse comprising means defining a transparent casing having a side wall, a closed upper end, and a base, a first conductor having inner and outer ends extending through said base with its inner end within said casing and its outer end exteriorly of said base, a second conductor having inner and outer ends with its inner end embedded within said base and its outer end exteriorly of said base, and a filament having an inner end engaged to the inner end portion of said first conductor and an opposite end fixed to said second conductor inner end within said base.

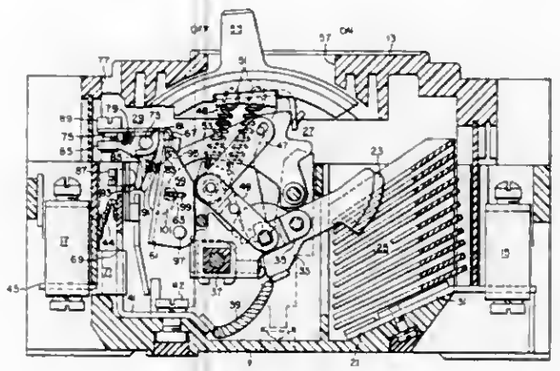
THERMALLY ADJUSTABLE CIRCUIT BREAKER

Stephen A. Mrenna, Beaver; Charles E. Haugh, New Brighton, and Glenn R. Thomas, Beaver, all of Pa., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Feb. 26, 1976, Ser. No. 661,592
Int. Cl.² H01H 71/14
U.S. Cl. 337—50 **5 Claims**

1. A multi-pole circuit breaker comprising a circuit breaker structure having a plurality of pole units, each pole unit comprising a pair of contacts, releasable means including a releasable arm to effect simultaneous opening of all of said pairs of contacts, trip means for each of said pole units, each trip means comprising a bimetal element being responsive to the occurrence of certain overload current conditions to effect release of the releasable means, the trip means also comprising a trip bar and a latch bracket, the trip bar being mounted to oscillate between latched and unlatched positions, the latch bracket being pivotally mounted with respect to the trip bar and being movable between latched and unlatched positions of the releasable arm and being urged to the unlatched position by the releasable arm, the trip bar being in the path of movement of each of the bimetal elements to effect movement



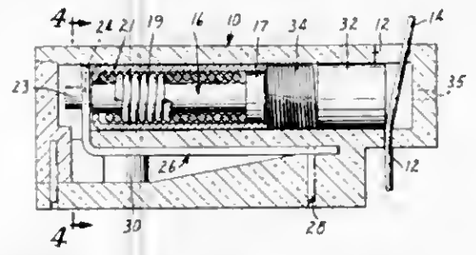
of said bracket when any one of said elements responds to an overload current, and adjustment means between the trip bar and the latch bracket for varying the distance between the bimetal elements and the trip bar.

4,030,061

ELECTRICAL WIRE CUTTING CIRCUIT BREAKER

Clifford R. Gaskell, Richfield, and Stephen E. Houghland, Maplewood, both of Minn., assignors to Minnesota Mining and Manufacturing Company, St. Paul, Minn.

Filed Apr. 14, 1976, Ser. No. 676,695
Int. Cl.² H01H 37/76, 71/20
U.S. Cl. 337—409 **9 Claims**



1. An electrical wire cutting circuit breaker comprising:

a housing formed with an electrical wire receiving aperture therethrough,

a wire cutting piston within said housing with its axis at an angle to the axis of said wire receiving aperture, said piston being axially movable from a rest position to a wire cutting position.

a compression spring positioned within said housing to propel said piston from said rest position to said wire cutting position,

retainer means movable into the path of said piston to retain it in said rest position against said compression spring, said retainer means being resiliently biased out of the path of said piston,

a thermally activatable stop positioned within said housing to retain said retainer means in the path of said piston at normal temperatures and to move at a predetermined elevated temperature to permit said retainer means to move out of the path of said piston, and

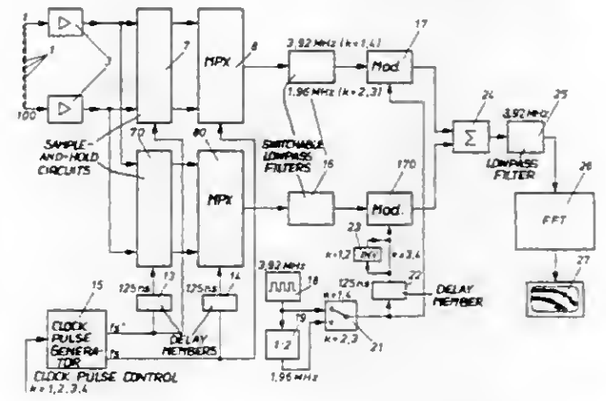
cutting means for severing a wire in said wire receiving aperture by the kinetic energy of said piston upon its release from said rest position by said retainer means and propulsion by said compression spring to said wire cutting position.

4,030,062

DIRECTION DETERMINATION IN SONAR SYSTEMS

Reiner Diehl, and Margitta Lütkemeyer-Hohmann, both of Bremen, Germany, assignors to Fried, Krupp Gesellschaft mit beschränkter Haftung, Essen, Germany

Filed Dec. 10, 1975, Ser. No. 639,603
Claims priority, application Germany, Dec. 14, 1974, 2459219
Int. Cl.² G01S 9/66, 3/80
U.S. Cl. 340—3 R **7 Claims**



1. In a method for determining the direction of echo signal pulses in a medium by means of a close range sonar system having at least one linear array of electroacoustic transducers and presenting a wide aperture angle and high azimuth and radial resolution,

the improvement comprising: dividing the total aperture angle into a plurality of partial regions each having a respective median direction and an aperture angle

$$\alpha \leq \frac{c}{D \cdot B},$$

where c is the speed of sound in the medium, D is the length of the transducer array, and B is the bandwidth of the emitted signal pulses; subjecting the received signals associated with each partial region to a delay time compensation corresponding to its associated median direction; scanning the signals received by successive units of the transducers of said array at a selected frequency f_s; intermediately storing the scanned signals; sampling successive ones of the intermediately stored signals at a sampling frequency f_s to form a serial signal; and phase compensating the resulting serial signal to produce a direction indication.

4,030,063

ULTRA LOW FREQUENCY ACOUSTIC GENERATOR

Albert E. Wallen, Winston-Salem, N.C., assignor to The United States of America as represented by the Secretary of the Navy, Washington, D.C.

Filed July 28, 1976, Ser. No. 709,151
Int. Cl.² H04B 13/00
U.S. Cl. 340—8 R **5 Claims**

1. An underwater acoustic signal generator comprising in combination:

a source of pneumatic fluid at a high pressure relative to ambient water pressure;

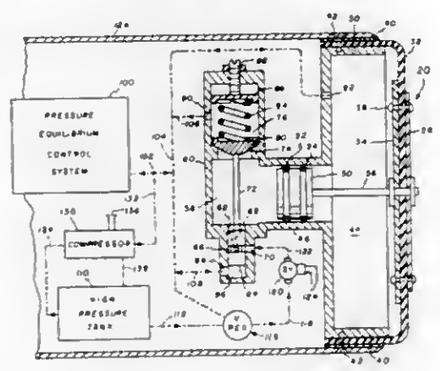
pressure equilibrium control means for providing pneumatic fluid at a reference pressure that is maintained substantially equal to ambient water pressure;

pressure reducing valve means, connected to said source and responsive to said reference pressure, for providing pneumatic fluid at a regulated pressure that is maintained at a predetermined differential over said reference pressure;

body means defining first and second chambers and a cylinder interconnecting said chambers;

pneumatic oscillator means, connected to said pressure reducing valve means to receive penumatic fluid at said regulated pressure and connected to said equilibrium control means so as to exhaust at said reference pressure, for effecting substantially square wave pneumatic pressure excursions in said second chamber at a predetermined frequency;

means for connecting the pressure equilibrium control means to said first chamber to provide pneumatic fluid at said reference pressure in said first chamber;



a first piston having one side exposed to said reference pressure in said first chamber and the other side exposed to ambient water pressures; and

a second piston disposed in said cylinder and connected directly to said first piston, said second piston being exposed on one side to pneumatic fluid at said reference pressure in said first chamber and on the other side to said pneumatic pressure excursions in said second chamber, whereby the effect of said pressure excursions on said second piston are transmitted through said first piston to said ambient water.

4,030,064

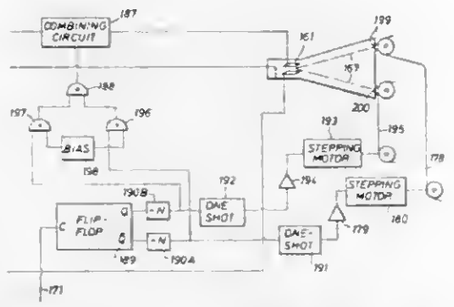
METHODS AND APPARATUS FOR RECORDING WELL LOGGING MEASUREMENTS

Jennings W. Elliott, Friendswood, Tex., assignor to Schlumberger Technolgy Corporation, New York, N.Y.

Division of Ser. No. 378,754, July 12, 1973, Pat. No. 3,916,372. This application Mar. 6, 1975, Ser. No. 556,058

Int. Cl.² G01V *1/40;* **H01J** *29/52*

U.S. Cl. 340—15.5 DS **4 Claims**



1. Apparatus for recording well logging data comprising:

means for producing synchronizing signals representative of a recurring event;

a cathode-ray tube having first and second deflection means and an intensity control means;

driving means responsive to said synchronizing signals and coupled to said first deflection means for providing a first signal of repetitively sweep the electron beam of said cathode-ray tube along an axis of the screen of said cathode-ray tube;

means for interrupting selected ones of said first signals to stop selected sweeps of said electron beam at a selected location along said axis;

means for providing first and second well logging data representative of subsurface characteristics at preselected depth intervals;

means coupled to said intensity control means and responsive to said first well logging data for modulating the intensity of said electron beam during sweeps of said electron beam to produce first indicia on said screen;

means coupled to said second deflection means and said intensity control means and responsive to said second well logging data for simultaneously modulating the intensity and location of said electron beam while said selected sweep of said electron beam resulting from said first signal is interrupted so as to produce second indicia on said screen;

a first recording medium located adjacent said screen of said cathode-ray tube and adapted for recording indicia produced thereon;

means for moving said first recording medium each that indicia produced by successive sweeps of said electron beam along a first axis of said screen are recorded at spaced intervals along said first recording medium and are representative of well logging data at preselected intervals;

a second recording medium located adjacent said screen of said cathode-ray tube adapted for recording indicia produced by successive sweeps of said electron beam along a second axis of said screen and which moves across said second axis of said screen such that traces along said second axis are recorded at spaced intervals along said second recording medium and are representative of well logging data at preselected intervals; and

means coupled to said second deflection means for shifting selected sweeps of said electron beam a preselected interval between said first axis and said second axis such that indicia produced along said first axis of said screen are recorded on said first recording medium and indicia produced along said second axis of said screen are recorded on said second recording medium.

4,030,065

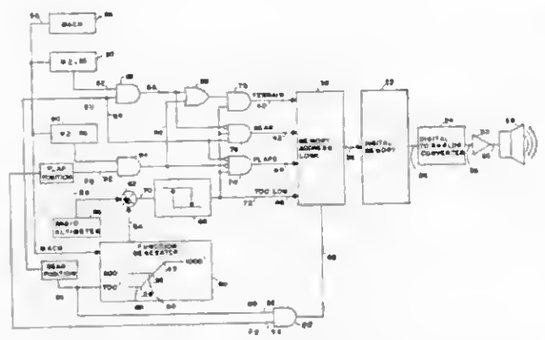
TERRAIN CLEARANCE WARNING SYSTEM FOR AIRCRAFT

Charles Donald Bateman, Bellevue, Wash., assignor to Sundstrand Corporation, Rockford, Ill.

Filed July 19, 1976, Ser. No. 706,519

Int. Cl.² G01C *5/00*

U.S. Cl. 340—27 AT **51 Claims**



1. A terrain clearance warning system for aircraft comprising:

a radar altimeter for generating signals representing the aircraft's altitude above the terrain;

a source of signals representing the aircraft's speed;

a source of signals representing the position of aircraft landing gear;

means, responsive to said speed signal, for generating a reference altitude signal as a function of aircraft speed;

means, responsive to said altitude signals and said reference altitude signals, for comparing aircraft altitude above terrain with said reference altitude signal;

means, responsive to said landing gear signal and speed signal and said comparing means for generating a first type of warning signal when the aircraft has descended below a first predetermined altitude below a predetermined speed with the landing gear up; and

means, responsive to said landing gear signal, said speed signal and said comparing means for generating a second type of warning signal when the aircraft has descended below a second predetermined altitude above said predetermined speed with the landing gear up.

4,030,066

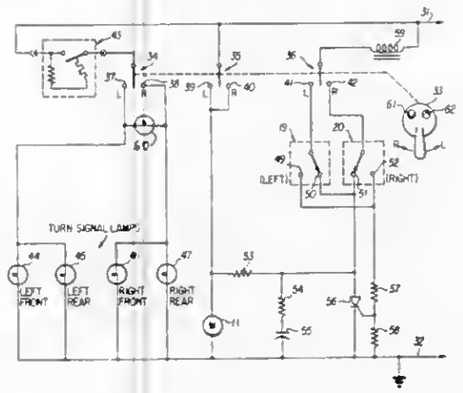
AUTOMATIC CANCELLATION MEANS FOR VEHICLE TURN INDICATOR SIGNALS

Rowland Kent White, 420 Kisconko Turn, Oxon Hill, Md. 20022

Filed Aug. 17, 1976, Ser. No. 715,134

Int. Cl.² B60Q *1/34;* **G01C** *19/02*

U.S. Cl. 340—73 **7 Claims**



1. In a turn indicator signal system for a vehicle having, turn signal means, selectively operable means for activating and deactivating said turn signal means, and means for automatically deactivating said turn signal means upon completion of a turn by the vehicle, the improvement wherein said automatically deactivating means comprises: a gyroscope mounted on said vehicle and having an axis of torque and an axis of precession, said axis of torque being located to respond to turning movements of the vehicle, means pivotally mounting said gyroscope on said axis of precession, and means responsive to pivotal movement of said gyroscope about said axis of precession for deactivating said turn signal means.

4,030,067

TABLE LOOKUP DIRECT DECODER FOR DOUBLE-ERROR CORRECTING (DEC) BCH CODES USING A PAIR OF SYNDROMES

Thomas H. Howell, Scottsdale; Gordon E. Gregg, Tempe, and Leonard Rabins, Scottsdale, all of Ariz., assignors to Honeywell Information Systems, Inc., Phoenix, Ariz.

Filed Dec. 29, 1975, Ser. No. 645,056

Int. Cl.² G06F *11/12*

U.S. Cl. 340—146.1 AL **10 Claims**

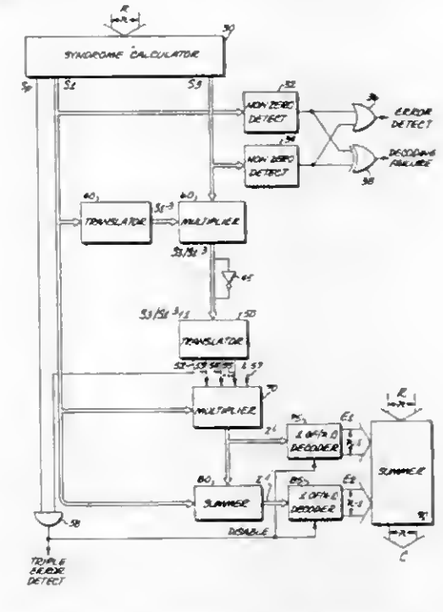
1. An apparatus for detecting and correcting double-bit errors in n-bit codewords, where said codewords include k information bits, $2m$ check bits and one parity bit ($n=k+2m+1$), said apparatus comprising:

means responsive to said codeword for calculating a first and a second syndrome, said syndromes identifying the existence and position of errors in said codeword according to an error-locator equation;

translation means responsive to said syndromes for generating root signals corresponding to one of the roots of said error-locator equation;

first multiplier means coupled to said translation means and to said calculation means for receiving said first syndrome and said root signals, said first multiplier means producing first signals for identifying a first error-location;

first summing means coupled to said first multiplying means and to said calculation means for receiving said first signals and said first syndrome, said summing means producing second signals corresponding to a second error-location;



first decoding means responsive to said first multiplying means for decoding said first signals and for producing an error word containing a 1 corresponding to said first error-location;

second decoding means responsive to said first summing means for decoding said second signals and for producing a second error word containing a 1 corresponding to said second error-locaton; and

second summing means adapted to receive said codeword and responsive to said first and said second decoding means, said second summing means adding said first and said second error words to said codeword for generating a corrected codeword.

4,030,068

OPTICAL CHARACTER RECOGNITION SYSTEM

D. Michael Banz, Wheaton, Md., assignor to Decision Data Computer Corporation, Horsham, Pa.

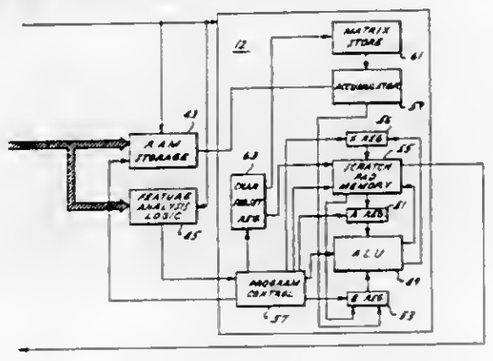
Filed Jan. 12, 1976, Ser. No. 648,298

Int. Cl.² G06K *9/12*

U.S. Cl. 340—146.3 AQ **4 Claims**

1. An optical character recognition system comprising means for scanning a character under test for generating digital information signals corresponding to the presence or absence of information bits at predetermined positions along the scan path, means operatively connected to said scanning means and responsive to the presence of the predetermined number of information bits located at adjacent positions within an area of the character under test, means responsive to the output of said last named means to thereby select a subgroup of characters having a distribution of information bits in said selective areas corresponding in general to the distribution enjoyed by said character under test, and means for performing a weight matrix analysis on each character com-

prising said selected subgroup of characters whereby each bit position of each of the characters comprising the selected



subgroup is compared with a corresponding one of said bit positions of said character under test.

4,030,069

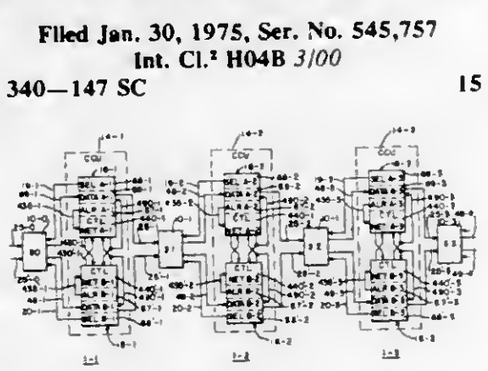
REDUNDANT MESSAGE METERING NETWORK

Gary C. Henrickson, Palo Alto, and John C. McDonald, Los Altos, both of Calif., assignors to TRW Inc., Los Angeles, Calif.

Filed Jan. 30, 1975, Ser. No. 545,757

Int. Cl.² H04B *3/00*

U.S. Cl. 340—147 SC **15 Claims**



1. A data transmission network for transmitting data comprising,

first transmission circuit means including redundant first and second data channels each operable, when enabled, to transmit data,

first channel control means including first alarm means for providing first alarms in response to alarm conditions associated with transmission of data over said first and second data channels and including first control network means responsive to said first alarms for enabling said first and second data channels,

second transmission circuit means including redundant third and fourth data channels each operable, when enabled, to transmit data received from said first or said second data channels,

second channel control means including second alarm means for providing second alarms in response to alarm conditions associated with transmission of data over said third and fourth data channels and including second control network means responsive to said second alarms for enabling said third and fourth data channels,

connection means including first connection means for connecting said first or said second data channel to said third data channel and including second connection means for connecting said first or said second data to said fourth data channel.

4,030,070

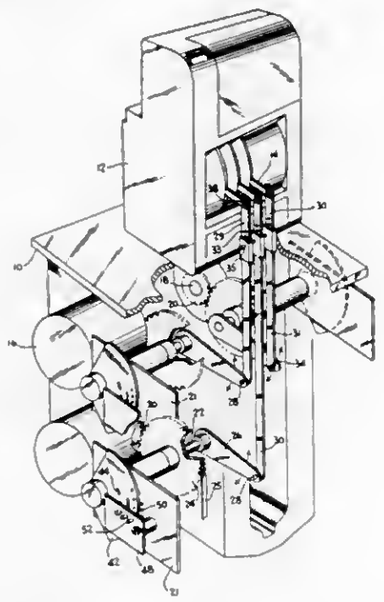
POSTAGE METER SETTING DEVICE

Louis T. Canevari, Norwalk; Vincent G. Coppola, North Branford; Daniel F. Dlugos, Huntington; Gerald C. Freeman, Darien, and Flavio M. Manduley, Seymour, all of Conn., assignors to Pitney-Bowes, Inc., Stamford, Conn.

Filed May 17, 1976, Ser. No. 687,043

Int. Cl.² H04Q *1/00*

U.S. Cl. 340—147 R **12 Claims**



1. Apparatus for remotely resetting the postage selector levers of a postage meter, comprising:

A. a housing;

B. a plurality of stepper motors each having a drive shaft extending therefrom;

C. a drive gear secured to each of said motor shafts;

D. a plurality of crank shafts rotatably secured within said housing;

E. a driven gear secured to each of said crank shafts, each of said driven gears being meshed within a drive gear;

F. a plurality of crank arms each secured at one end of said crank shafts for rotation therewith;

G. means associated with each crank shaft for determining the rotational position of each crank arm;

H. a plurality of linkage members each having one end pivotably secured to one of said crank arms and its opposite end connected to a postage selector lever; and

I. means for selectively energizing said stepper motors to selectively reset the postage selector lever.

4,030,071

ELECTRICALLY OPERATED LOCKING MECHANISM

Herbert J. Barker, 6009 Rising Sun Ave., Philadelphia, Pa. 19111

Filed Apr. 22, 1976, Ser. No. 679,247

Int. Cl.² G08B *13/08*

U.S. Cl. 340—164 R **11 Claims**

1. An electrically operated lock system comprising in combination

solenoid means having a slideable core,

means coupled to said slideable core to be moved in response to said solenoid being energized to provide a locking means,

key receptacle means having a plurality of portions formed to effect electrical contacts,

first jumper means disposed to connect certain of said portions together,

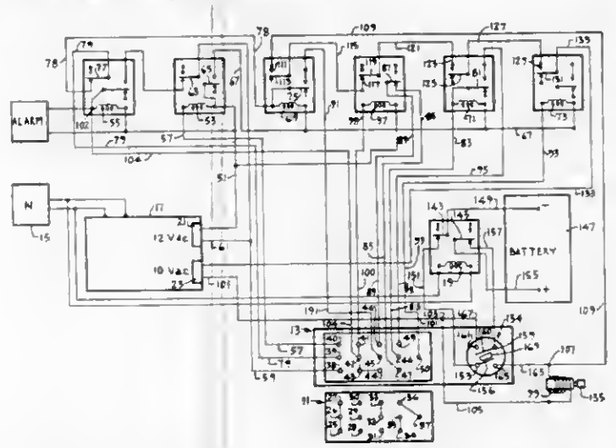
first and second groups of relays each having normally open and normally closed relay points and transfer straps associated therewith, said first and second groups of relays

having their relay points and transfer straps interconnected with each other and with certain of said portions so that when said first group of relays is energized and said second group of relays is unenergized, there are formed first and second electrical energy paths interrupted only by connection voids between certain of said receptacles,

said first electrical energy path providing a means through which electrical energy passes to energize certain relays of said first group,

said second electrical energy path providing a means to energize said solenoid,

first and second power means,



said first power means connected to certain of said portions and to certain of said relays,

said second power means connected to said solenoid through said second electrical energy path,

key means having a plurality of portions engaging portions of said key receptacle means,

second jumper means connecting certain of said portions of said key means whereby when said key means is inserted into said key receptacle means said connection voids have electrical connections thereacross and accordingly power is applied through said key receptacle means to energize said first group of relays to effect an energization of said solenoid through said second electrical energy path.

4,030,072

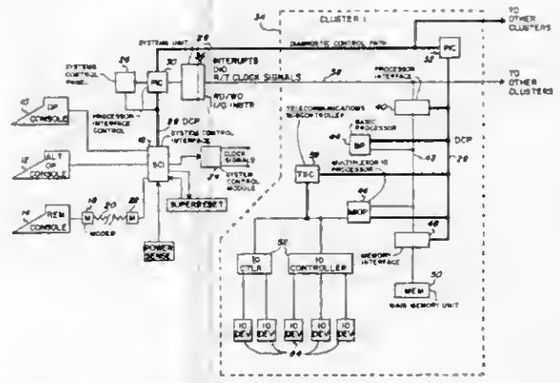
COMPUTER SYSTEM OPERATION AND CONTROL

Eyjolf Steuart Bjornsson, Manhattan Beach, Calif., assignor to Xerox Corporation, Stamford, Conn.

Filed Dec. 18, 1974, Ser. No. 534,045

Int. Cl.² G06F *11/04*

U.S. Cl. 340—172.5 **8 Claims**



1. A data processing system having a plurality of devices including a basic processor, memory unit and I/O processor, said devices interconnected to one another by a first group of data and address lines comprising a first electrical bus, the data processing system further comprising:

a. at least one operator console,

b. a controller connected to said operator console, said controller including a microprogrammed processor comprising:

1. a control memory for storing a programmed sequence diagnostic control words,

2. means for addressing said control memory,

3. an arithmetic and logic unit for processing said control words, and

4. addressing means connected to said arithmetic and logic unit for generating an address,

c. a second group of data and address lines comprising a second electrical bus, said second bus independent of said first bus for carrying diagnostic control signals associated with said diagnostic control words, said second bus connected to said controller,

d. one of said plurality of devices comprising:

1. diagnosing means for conducting diagnostic tests thereon, and

2. means responsive to said address generated by said addressing means;

e. said diagnosing means comprising storage means for storing procedures of said diagnostic test therein,

f. said diagnosing means initiated by a signal of said controller on said second bus and conducting said diagnostic test independently of said controller,

g. said diagnosing means providing an indication of successful completion of said diagnostic test on said second bus to said controller.

4,030,073

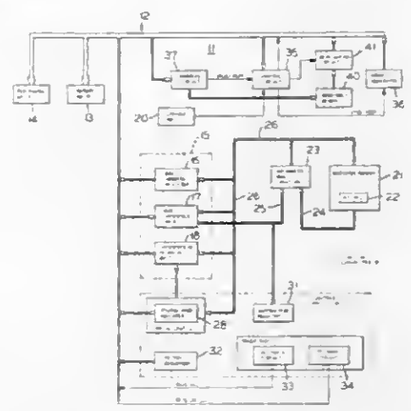
INITIALIZATION CIRCUIT FOR ESTABLISHING INITIAL OPERATION OF A DIGITAL COMPUTER

Robert A. Armstrong, Jr., Stow, Mass., assignor to Digital Equipment Corporation, Maynard, Mass.

Filed Nov. 5, 1975, Ser. No. 629,028

Int. Cl.² G06F *3/00*

U.S. Cl. 340—172.5 **5 Claims**



1. An initialization circuit for loading initial information including data and instructions defining a predetermined operating condition into a digital computer system that includes a bus, a power supply, first means for transmitting address signals onto the bus when the power supply initially is energized, means for transmitting a power supply status signal onto the bus and means for transmitting and receiving transfer control signals onto and from the bus to transfer information over the bus, said initialization circuit comprising:

A. memory means including a storage location containing the initial information and instructions for loading the initial information onto the bus for transfer to the digital computer system,

B. address generator means for transmitting address signals onto the bus, and

C. control means connected to the bus, said address generator means and said memory means for controlling trans-

fers of information from said memory means, said control means including:

i. means responsive to the power supply status signal from the bus for enabling said address generator means to transmit address signals onto the bus simultaneously with the transmission of address signals from the first address signal transmitting means in the digital computer system thereby to produce combined address signals that designate a said storage location in said memory means, and

ii. transfer means responsive to certain of the control signals and the combined address signals on the bus for transferring the contents of said storage location in said memory means over the bus to the digital computer system thereby to establish the predetermined initial operating condition in the digital computer system.

4,030,074

SYSTEM FOR CHECKING TWO DATA PROCESSORS OPERATING IN PARALLEL

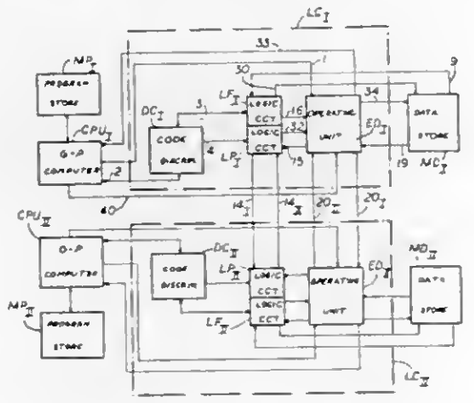
Silvano Giorcelli, Turin, Italy, assignor to Centro Studi e Laboratori Telecomunicazioni, Turin, Italy

Filed June 3, 1975, Ser. No. 583,250

Claims priority, application Italy, June 3, 1974, 68735/74

Int. Cl.² G06F *11/08, 15/00*

U.S. Cl. 364—200 **9 Claims**



1. In a data-processing system, in combination:

a pair of substantially identical data processors connected for parallel operation in the performance of a succession of operating cycles, ech data processor comprising a computer and a data store, said computer being provided with programming means establishing a succession of operating cycles, each cycle including a transfer operation and a checking operation;

a pair of substantially identical logic networks each inserted between the computer and the data store of a respective one of said data processors, each of said networks including memory means for the temporary registration of data called forth from and destined for the respective data store, each of said networks further including transfer means independent of said memory means connected to the respective computer and to the respective data store for transmitting data words therebetween during a transfer operation of any operating cycle;

comparison means for ascertaining the equality of information respectively registered in said memory means of said networks, said comparison means being provided with enabling circuitry rendered effective by the respective computer at the end of an operating cycle; and

feedback means extending from said comparison means to the computers of said data processors for reverting to an earlier operating cycle upon ascertainment of a mismatch between the contents of the respective memory means of said networks;

each of said logic networks comprising a first counter for the counting of successive operating cycles and a second counter for the counting of successive checking operations, said counters having output connections extending to said comparison means for initiating a checking operation upon the count of said first counter exceeding that of said second counter.

4,030,075

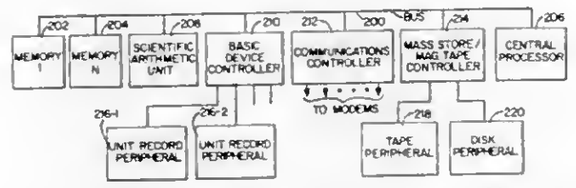
DATA PROCESSING SYSTEM HAVING DISTRIBUTED PRIORITY NETWORK

George J. Barlow, Tewksbury, Mass., assignor to Honeywell Information Systems, Inc., Waltham, Mass.

Filed June 30, 1975, Ser. No. 591,902

Int. Cl.² G06F *9/18*

U.S. Cl. 340—172.5 **21 Claims**



1. A data processing system having a priority determining system comprising:

A. a plurality of units each capable of either or both transferring or receiving information;

B. a common electrical bus, coupled to each of said units, for providing a path for the asynchronous transfer of informatin between any two of said units; and

C. a priority network, coupled with each of said units, for indicating the one of said units which is the highest priority unit requesting to transfer information over said bus, said priority network comprising:

1. a priority bus having a first end and a second end, the one of said units coupled to said first end of said priority bus having the highest priority, the one of said units coupled to said second end of said priority bus having the lowest priority, and the other ones of said units having a priority relative to their proximity to said first and second ends of said priority bus, and

2. priority logic, included in each of said units, said priority logic having

a. means for asynchronously attempting to transfer information over said common has independent of the operation of any other of said units, and

b. means, responsive to said means for asynchronously attempting to transfer information included in each of said units, for enabling said transfer of information if there is no other unit of higher priority currently transferring or attempting to transfer information over said common bus.

4,030,076

PROCESSOR NUCLEUS COMBINED WITH NUCLEUS TIME CONTROLLED EXTERNAL REGISTERS INTEGRATED WITH LOGIC AND ARITHMETIC CIRCUITS SHARED BETWEEN NUCLEUS AND I/O DEVICES

Arnold Blum, Pforzheim; Johann Hajdu, Boeblingen; Claus Erich Mohr, Munich; Leopold Reichl, and Guenther Sonntag, both of Boeblingen, all of Germany, assignors to International Business Machines Corporation, Armonk, N.Y.

Filed July 16, 1975, Ser. No. 596,487

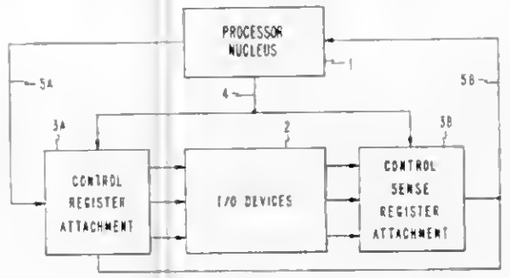
Claims priority, application Germany, Aug. 2, 1974, 2437252

Int. Cl.² G06F *3/00, 7/38, 9/12*

U.S. Cl. 340—172.5 **6 Claims**

1. In a stored program data processing system including a processor nucleus and input/output (I/O) devices, said processor nucleus including control storage containing microinstructions and data, said microinstructions having control bits and address bits, a microinstruction register connected to receive microinstructions from said control storage, microinstruction fetch means for accessing said control storage and transferring a selected microinstruction to said microinstruction register, a data local store, addressing means for addressing said data local store, internal address generation means selectively connectable by said control bits to receive said address bits from a microinstruction in said microinstruction register and connected to provide addresses to said addressing means, first and second operand registers having inputs from said data local store, from said microinstruction register and from sources external to said processor nucleus, an arithmetic and logic unit (ALU) connected to said operand registers, a data register connected to receive data from said ALU, clock timing control means connected to be controlled by said control bits and operable to provide timing control signals, the improvement comprising:

external address register means selectively connectable under control of said control bits to receive said address bits from said mircoinstruction,



external registers having logic means integral therewith to perform logical operations on data entered into said external registers for either said processor nucleus or said I/O devices

means connecting said logic means integral with said external registers to said I/O devices,

first gating means connected to control entry of data into said external registers, said first gating means connected to receive data from said data register under control of said external address register means and said clock timing control means, said data entered into said external registers including control data for said logic means integral with said external registers, and

second gating means connected to said logic means integral with said external registers to receive output data therefrom and pass said output data to said operand registers in said processor nucleus, said second gating means being connected under control of said external address register means and said clock timing control means.

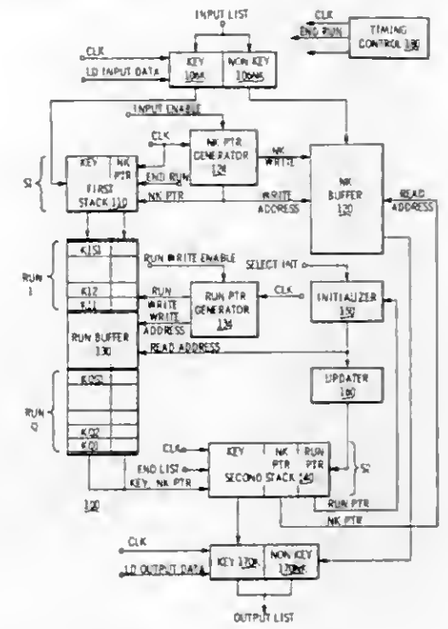
number into proper numerical order among the numbers previously received from the same group;

M-1 subsequent stages for progressively forming fewer groups of more numbers each, the last stage of which forms the numerically sorted output list, each stage including:

interstage storage means for storing the ordered groups from the preceding stage;

stack input means for sequentially receiving each of the numbers stored in the interstage storage means;

comparing means for comparing each currently received number to the previously received numbers currently in the sorting stack;



pushdown storage means of inserting each currently received number into proper numerical order among the previously inserted numbers, which pushdown storage means progressively fills up from a first position to a last position as each currently received number is inserted;

interstage output means for advancing the current number in the last position to the next stage; and

pointer means for identifying the next-to-be received number from the interstage storage means which is the next number from the same group as the current number in the last position; and

output means for receiving the ordered numbers from the last stage.

4,030,077

MULTISTAGE SORTER HAVING PUSHDOWN STACKS FOR ARRANGING AN INPUT LIST INTO NUMERICAL ORDER

Judit Katalin Florence, Menlo Park, and Michel Alexandre Rohner, San Jose, both of Calif., assignors to The Singer Company, Binghamton, N.Y.

Filed Oct. 16, 1975, Ser. No. 622,911

Int. Cl.² G06F *7/24*

U.S. Cl. 340—172.5 **21 Claims**

1. An M stage sorter for arranging input numbers into a numerically sorted output list, comprising:

means for grouping the input numbers into groups;

a first stage for ordering the input numbers within each of the groups, formed by a sorting stack which includes:

stack input means for sequentially receiving all of the numbers within each of the groups;

comparing means for comparing each currently received number to the previously received numbers from the same group; and

stack storage means for inserting each currently received

4,030,078

DYNAMIC MEMORY ARRANGEMENT FOR PROVIDING NONCYCLIC DATA PERMUTATIONS

Werner Klüge, Bensberg-Refrath, Germany, assignor to Gesellschaft fur Mathematik und Datenverarbeitung m.b.H., Bonn, Germany

Filed Dec. 16, 1975, Ser. No. 641,593

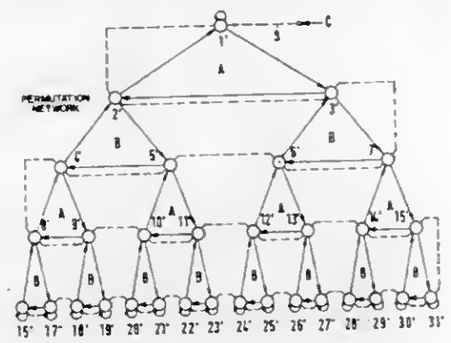
Claims priority, application Germany, Dec. 16, 1974, 2459476

Int. Cl.² G11C *9/02, 19/00, 21/00*

U.S. Cl. 340—172.5 **8 Claims**

1. In a circuit arrangement for noncyclic data permutations between the memory cells of a dynamic memory including a permutation network for transferring the contents of a predetermined memory cell into the read-write cell of the memory, and an access control means connected to said permutation network, for producing a permutation sequence to cause the transfer of the contents of the predetermined memory cell into said read-write cell of the memory; the improvement wherein: said permutation network is comprised of 2^k-1 memory cells which are arranged in a tree-like structure in k of 0 to $k-1$

numbered planes so that plane i is formed of 2^i memory cells, each memory cell of plane i is connected with two adjacent interconnected memory cells of plane $i+1$ so that these three associated memory cells form an interconnected triangle in which the contents of said memory cells can be cyclically interchanged in a clockwise direction, each memory cell of the planes $1 \leq i \leq k-2$ is included in two of such triangles, and the one memory cell of plane 0, which acts as the read-write cell for the memory and each of the memory cells of plane k–1 is included in but one triangle; and said access



control means is connected to said permutation network for producing either a permutation A constituted by the simultaneous transfer of the contents of the memory cells disposed in even numbered planes to the associated memory cells of the next higher odd numbered planes or a permutation B constituted by the simultaneous transfer of the contents of the memory cells disposed in odd numbered planes to the associated memory cells of the next higher even numbered plane, said permutation sequence constituting a sequence of permutation A and permutation B.

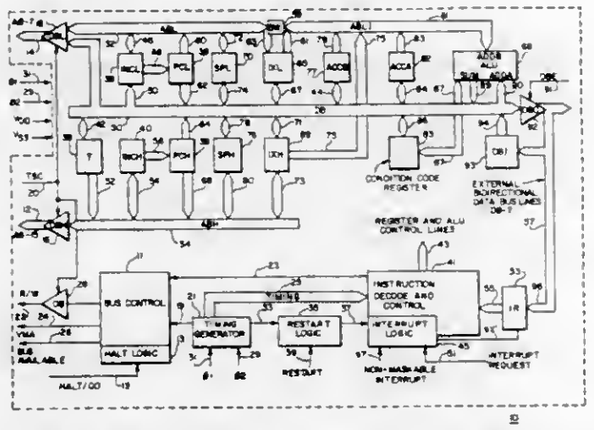
PROCESSOR INCLUDING INCREMENTOR AND PROGRAM REGISTER STRUCTURE

Thomas H. Bennett; Earl F. Carlow, both of Scottsdale; Anthony E. Kouvoussis, Phoenix, all of Ariz.; Rodney H. Orgill; Charles Peddle, both of Norristown, Pa., and Michael F. Wiles, Phoenix, Ariz., assignors to Motorola, Inc., Chicago, Ill.

Continuation of Ser. No. 519,150, Oct. 30, 1974, abandoned. This application Sept. 2, 1976, Ser. No. 719,889

Int. Cl.² G06F *7/50*

U.S. Cl. 340—172.5 **4 Claims**



1. A processor including a first bus, a second bus, and control means for producing control signals, said processor also including means comprising:

counter means having a plurality of inputs and a plurality of outputs and responsive to said control means and coupled between said first bus and said second bus for incrementing digital information at said inputs in response to said control means;

first means responsive to said control means for operatively coupling said inputs to said first bus to effect transferring digital information from said first bus to said inputs;

second means responsive to said control means for operatively coupling said inputs to said second bus to effect transferring digital information from said second bus to said inputs;

third means responsive to said control means for operatively coupling said outputs to said second bus to effect transferring digital information from said outputs to said second bus;

said second means and said third means controllably coupling said outputs, respectively, to said inputs via said second bus in response to said control means in order to cause said counter means to temporarily latch information present on said inputs upon the condition that said first means and said third means, respectively, simultaneously operatively couple said outputs to said second bus and said second bus to said inputs.

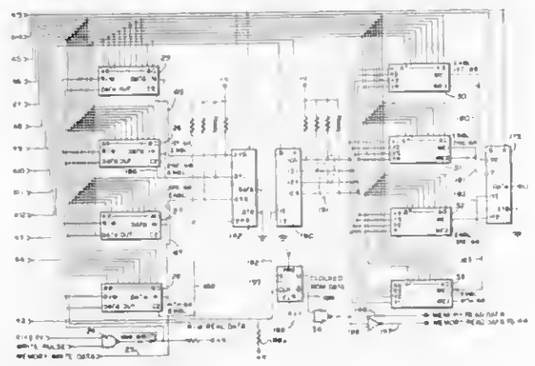
VARIABLE MODULE MEMORY

Bobby G. Burkett, Richardson, and Raymond W. Henry, Dallas, both of Tex., assignors to Texas Instruments Incorporated

Division of Ser. No. 431,538, Jan. 7, 1974, Pat. No. 3,953,034. This application Dec. 24, 1975, Ser. No. 643,970

Int. Cl.² G06F *13/00*; **G11C** *9/00*

U.S. Cl. 340—172.5 **6 Claims**



1. In a programmable controller for selectively connecting and disconnecting a power signal to each of a plurality of output devices in response to computed respective on/off states generated by execution of a stored control program on a plurality of binary parameters, wherein the value of each of said parameters corresponds to a state of a respective input device, a variable module memory for storing said control program comprising:

a. a set of up-to-N memory modules, each for storing a plurality of program instructions of n binary bits each;

b. N receptacle means for receiving said set of up-to-N memory modules, and for coupling each of the received memory modules to a common serial output bus;

c. memory address control means coupled via said receptacle means to said up-to-N memory modules for providing address signals for sequentially addressing each of ten memory modules and sequentially addressing the program instruction words of the addressed memory module to provide the contents stored therein in series to said common serial output bus; and

d. means for detecting the absence of memory modules in said receptables and for forcing said common serial data output bus to a predetermined binary state for all bits of

all program instruction words of vacant ones of said receptable means.

APPARATUS FOR THE TREATMENT OF YARN THICKNESS VARIATION SIGNALS

Tsugio Goto, Nobeoka, Japan, assignor to Asahi Kasei Kogyo Kabushiki Kaisha, Osaka, Japan

Continuation of Ser. No. 343,980, March 22, 1973, Pat. No. 3,885,232. This application Nov. 5, 1974, Ser. No. 521,189

Claims priority, application Japan, Mar. 24, 1972, 47-29893

Int. Cl.² G11C *11/24*; **G06H** *3/05*

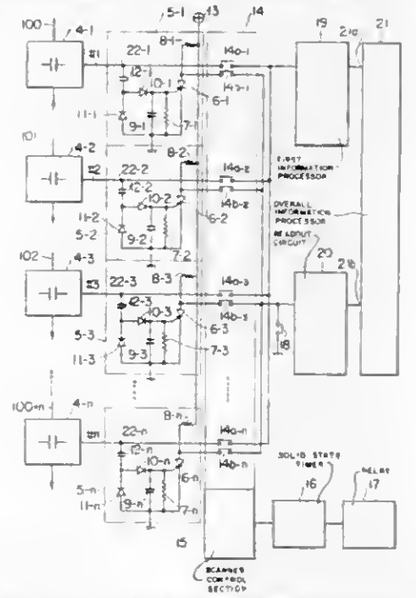
U.S. Cl. 340—173 R **1 Claim**

1. An apparatus for processing defect signals from a plurality of yarns wherein said signals may be applied to a computer, said apparatus comprising:

a. a plurality of sensor means, each sensor means associated with one of said yarns for detecting a defect in said yarns;

b. a plurality of memory means, each of said memory means coupled to a corresponding one of said sensor means for storing a defect signal produced by the corresponding said sensor means;

c. scanner means coupled to said plurality of memory means and to said computer for cyclically sequentially sampling the signals stored in said memory means and applying the signals stored therein to said computer; and



d. reset means for periodically resetting said memory means at the beginning of each sampling cycle.

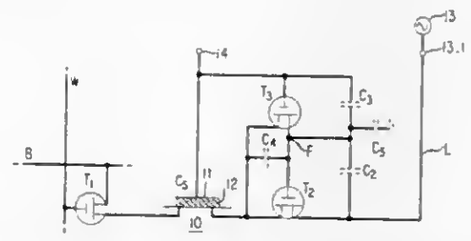
SELF-REFRESHED CAPACITOR MEMORY CELL

Harry Joseph Boll, Berkeley Heights, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Continuation-in-part of Ser. No. 565,227, April 4, 1975, abandoned. This application Dec. 18, 1975, Ser. No. 642,191

Int. Cl.² G11C *11/00*

U.S. Cl. 340—173 DR **43 Claims**



1. Apparatus which comprises:

a. a capacitor memory element capable of storing electrical charge to represent binary digital memory states of the element;

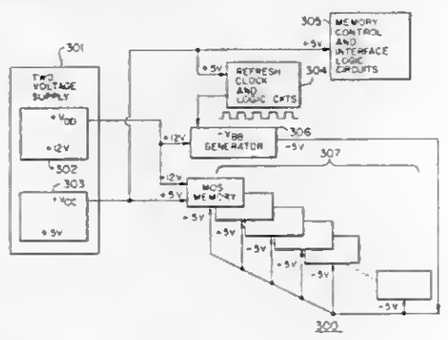
b. a first electrical network means for providing access reading and writing signals to the element; and

c. a second electrical network refresh means including first and second switching transistors, each having a pair of high current terminals and a low current terminal, one high current terminal of the first switching transistor being ohmically connected to a terminal of the memory element and the other high current terminal of the first switching transistor being ohmically connected to an electrically conductive refresh line, said refresh line having a refresh terminal means for the connection thereto of electrical means for acting as an electrical sink for spurious charges in the memory element during operation, one high current terminal of the second switching transistor being ohmically connected to the one high current terminal of the first switching transistor and the other high current terminal of the second switching transistor being ohmically connected to the low current terminal of the first switching transistor, the low current terminal of the second switching transistor being connected to a different terminal of the memory element.

4,030,084
SUBSTRATE BIAS VOLTAGE GENERATED FROM REFRESH OSCILLATOR

Edwin P. Fisher, N. Abington, and Robert B. Johnson, Billerica, both of Mass., assignors to Honeywell Information Systems, Inc., Waltham, Mass.

Filed Nov. 28, 1975, Ser. No. 636,276
Int. Cl.² G11C 11/40
U.S. Cl. 340—173 R 6 Claims



1. In a metal-oxide semiconductor (MOS) memory array associated with a data processing unit wherein information in groups of said (MOS) memory elements is to be refreshed by a refresh means, apparatus for providing negative bias to said (MOS) memory array comprising:

a. first means for providing a plus voltage to said MOS memory array relative to ground;

b. second means in said (MOS) memory array coupled to said first means for providing rectangular wave refresh clock signals;

c. third means responsive to the rectangular wave refresh clock signals for switching between the plus voltage and ground;

d. fourth means coupled to said third means for alternately accumulating the positive charge and releasing the positive charge to ground, whereby an a.c. voltage is generated;

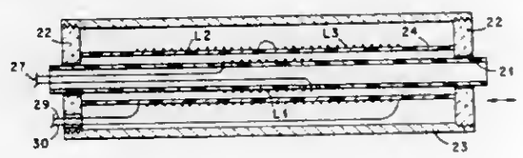
e. fifth means coupled to said fourth means for rectifying the a.c. voltage signal; and

f. sixth means coupled to said fifth means for filtering the rectified a.c. voltage signal.

4,030,085
NONFERROMAGNETIC LINEAR VARIABLE DIFFERENTIAL TRANSFORMER

James F. Ellis, Powell, and Peter L. Walstrom, Oak Ridge, both of Tenn., assignors to The United States of America as represented by the United States Energy Research and Development Administration, Washington, D.C.

Filed July 20, 1976, Ser. No. 707,000
Int. Cl.² G08C 19/08
U.S. Cl. 340—199 4 Claims

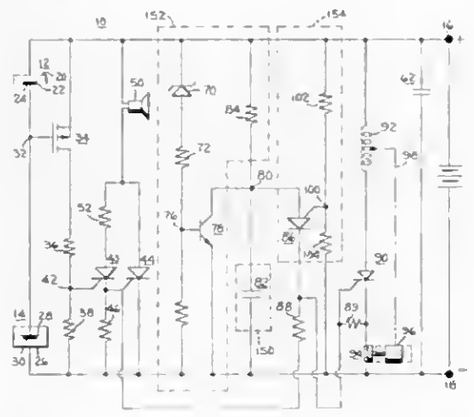


1. A nonferromagnetic linear variable differential transformer system for measuring mechanical displacements in the presence of a high magnetic field, comprising a cylindrical non-magnetic housing, a pair of respective non-magnetic end plates mounted in the respective ends of said housing, said end plates being provided with respective axial apertures therein, a slidable shaft of a non-magnetic insulator material, said shaft adapted to be moved between and through said apertured end plates, a coil form of a non-magnetic insulator material mounted within said housing and affixed to said end plates, said coil form axially encompassing said slidable shaft, a primary coil wound about said shaft, a pair of secondary coils wound series-opposed about said coil form, an oscillator for providing a fixed-frequency, constant-voltage signal, a first pair of leads coupled between said oscillator and said primary coil, a first capacitor means connected across said leads for tuning said primary coil to resonance, a phase sensitive demodulator, a second pair of leads coupled between said demodulator and said secondary series-opposed coils, and a second capacitor means connected across said second pair of leads for tuning said secondary coils to a resonant frequency slightly higher than the frequency of said oscillator, said primary coil being normally positioned in a null position with respect to said secondary coils, whereby when said slidable shaft is displaced axially within said housing said demodulator will provide an accurate indication of such displacement.

4,030,086
BATTERY VOLTAGE DETECTION AND WARNING MEANS

Robert J. Salem, Danbury, Conn., assignor to General Electric Company, Bridgeport, Conn.

Filed Nov. 10, 1975, Ser. No. 630,201
Int. Cl.² G08B 19/00, 17/10
U.S. Cl. 340—249 5 Claims



1. For use in a battery-operated device such as a smoke detector, means for detecting when the battery voltage drops below a predetermined level and for providing warning in response thereto, said detection and warning means comprising:

terminal means for connection to the terminals of a battery, a capacitor,

capacitor charging circuit means connected to said terminal means and said capacitor for gradually charging said capacitor when the voltage of a battery connected to said terminal means drops below a predetermined level, said capacitor charging circuit means including resistive means coupled to said capacitor, a normally conductive switching element in parallel with said capacitor, and voltage sensing means connected across said terminal means, said voltage sensing means coupled to said normally conductive switching element to maintain said normally conductive element conductive when the voltage of a battery connected to said terminal means is above the predetermined level and to render said normally conductive element non-conductive when the voltage of a battery connected to said terminal means drops below the predetermined level, whereby said capacitor charges only when the voltage of a battery connected to said terminal means drops below the predetermined level for a period of time,

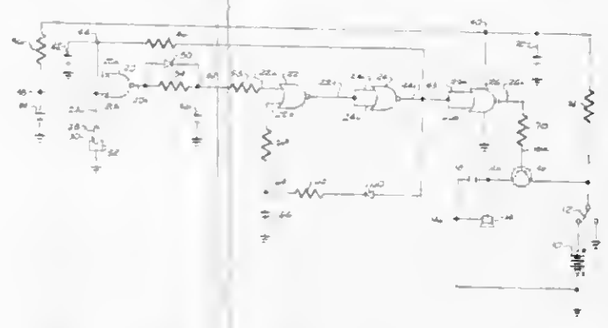
capacitor discharging circuit means connected to said capacitor and responsive to the voltage of said capacitor for rapidly discharging said capacitor when the charge on said capacitor exceeds a predetermined level,

and alarm means coupled to said capacitor discharging circuit means for producing a warning signal in response to at least the initial discharge of said capacitor.

4,030,087
ANTI-THEFT ALARM SYSTEM

Dale A. Ritchie; Walker G. Petroff, and Roy G. Smarr, Jr., all of Columbia, S.C., assignors to Augustus E. Quattlebaum, Pendleton, S.C.

Filed Mar. 12, 1976, Ser. No. 666,391
Int. Cl.² G08B 13/22
U.S. Cl. 340—261 8 Claims



1. In an alarm system for detecting a desired disturbance to an associated structure, said system having a buzzer for emitting an audible alarm signal in response to said detection, a d-c power source connected to said buzzer for supplying current thereto, first and second switch means connected in series with said buzzer and said power source for selectively connecting said buzzer to said power source, said first switch means being manually operated to activate said alarm system, a disturbance detecting circuit for controlling said second switch means comprising:

a detection means for detecting said disturbance and producing a detection signal;

a first digital logic gate means having a first input terminal coupled to said detection means for receiving said detection signal and producing a conditioned output signal of a predetermined level;

a second digital logic gate means having first and second input terminals and an output terminal, said first input terminal coupled to said first logic gate means for receiving said predetermined output signal and producing an output signal of a predetermined voltage level;

latch-up means coupled to said input terminal of said second logic gate for gating said second logic gate on and clamping the output terminal of said second logic gate at said predetermined voltage level when said disturbance is continued for a predetermined period of time;

a third digital logic gate means providing a high gain inverting amplifier having an input coupled to the output terminal of said second logic gate means and an output terminal coupled to said second switch means;

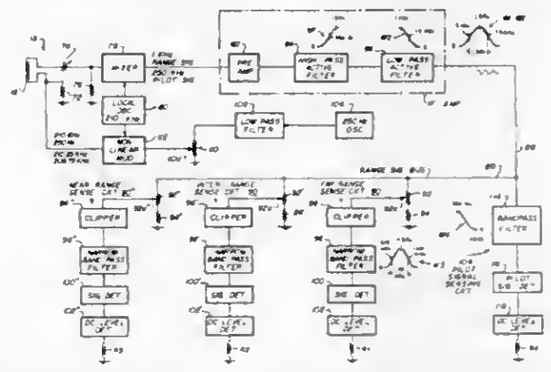
said third logic gate means inverting said predetermined output voltage of said second logic gate producing an output signal for switching said second switch means into conduction; and

said buzzer emitting a short audible alarm signal when said system is activated an an initial disturbance is detected and, thereafterward, said buzzer emitting a continuous audible alarm signal when said disturbance is continued for said predetermined period of time.

4,030,088
VEHICLE PROXIMITY SENSING AND CONTROL SYSTEM

David Jacob McCullough, Spruce Head Island, Maine, assignor to Dynascan Corporation, Chicago, Ill.

Continuation-in-part of Ser. No. 336,417, Feb. 28, 1973, abandoned. This application Oct. 21, 1974, Ser. No. 516,656
Int. Cl.² G08B 21/00
U.S. Cl. 340—267 C 21 Claims



1. A proximity sensing and control system for a vehicle having powered drive means, the system comprising, in combination: a radio transmitter and associated transmitting antenna associated with the system for radiating an alternating electromagnetic field at a low enough frequency such that signal reinforcement or attenuation at a receiving location due to signal reflections from nearby objects does not generally occur, and the induction field component predominates in strength over the electric field within the desired operating range of the system; a radio receiver and associated receiving antenna for sensing the level of the electromagnetic field thereat, one of said antennas being mounted on said vehicle and the other antenna being mounted remote therefrom, so the spacing therebetween varies as the vehicle is moved; first control means for carrying out a first control operation when the transmitting and receiving antennas are relatively widely spaced apart; second control means for carrying out a second control operation when the transmitters and receiving antennas are relatively closely spaced apart, the relative signal strengths at the receiving antenna being vastly different for these two relative spacings; said radio receiver including a given received signal output point; first and second range sensing circuits connected in parallel to said received signal output point and respectively including first and second signal level detecting means responsive to given signal levels indicative respectively of said relatively wide and close spacings of said transmitting and receiving antennas by initiation of operation respectively of said first and second control means, and first and second adjusting means associated with said first and second range sensing circuits for adjusting the level of the received signal at said received signal output point which effects operation of the associated control means.

4,030,089
ALARM SYSTEM

Wolfgang Wurfel, Konigsteinstrasse 12, 8000 Munich 40, BRD, Germany

Filed Apr. 2, 1976, Ser. No. 672,973
Int. Cl.² G08B 13/04, 13/08
U.S. Cl. 340—274 R 3 Claims

1. In an alarm system with a sensor arrangement including a break responsive means on a relatively movable part energized from a source of electric energy on a locally fixed part, the improvement comprising:

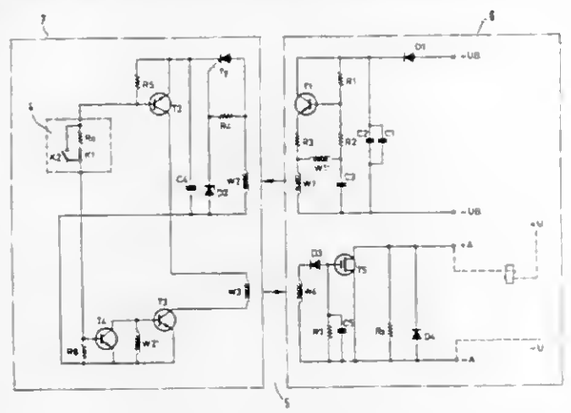
a first coil on an open core disposed on said fixed part for connection to a circuit including an alternating voltage source;

a second coil electrically coupled to the sensor arrangement on a second core disposed on the relatively movable part,

so that said first coil transmits energy to said second coil when said parts are in normal adjacent position;

a third coil on an open core mounted on said relatively movable part and connected to the sensor arrangement to normally maintain one state of operation; and

a fourth coil on an open core mounted on said fixed part;



said cores carrying said third and fourth coils being spaced apart with the coils thereon magnetically coupled with said parts are in normal adjacent position; and circuit means interconnecting said sensor arrangement and said second and third coils whereby actuation of the sensor arrangement will cause a change in the state of energization of said third and fourth coils.

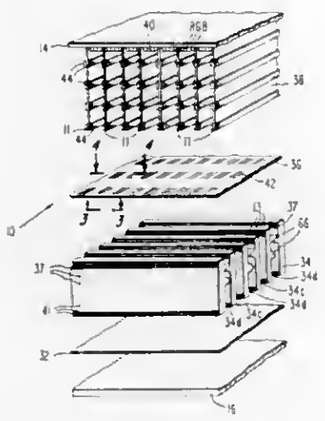
FLAT IMAGE DISPLAY DEVICE UTILIZING DIGITAL MODULATION

John Guiry Endriz, Plainsboro, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Dec. 17, 1975, Ser. No. 641,641

Int. Cl.² G09F *9/32*

U.S. Cl. 340—324 M **13 Claims**



1. An image display device comprising a matrix of cathodoluminescent cells, each cell including:

a. a source of electrons;

b. an electron multiplier, including at least one dynode member for multiplying electrons emitted from said electron source, said multiplier being open to feedback and of sufficiently high gain to produce regenerative feedback and sustained electron emission;

c. digital modulation means for modulating a flow of electrons from an output of said electron multiplier;

d. means for accelerating the modulated flow of electrons; and

e. a cathodoluminescent screen excitable by the accelerated and modulated flow of electrons.

4,030,091

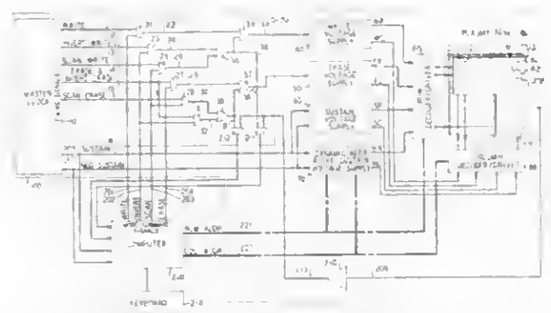
TECHNIQUE FOR INVERTING THE STATE OF A PLASMA OR SIMILAR DISPLAY CELL

Peter Dinh-Tuan Ngo, Colts Neck, N.J., assignor to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed Jan. 30, 1976, Ser. No. 653,662

Int. Cl.² H01J *17/48*

U.S. Cl. 340—324 M **26 Claims**



1. Circuitry for inverting a gas discharge display cell having light-emitting and non-light-emitting states from a current one of said states to the other, said cell comprising a volume of gas having an associated breakdown voltage and adapted to store voltages across said volume of gas, a characteristic voltage being stored at said cell when it is in said light-emitting state, said circuitry comprising

first means for applying a first signal to said cell, said first signal storing a first voltage at said cell at a predetermined time if said current state is said non-light-emitting state,

second means for repetitively applying first and second polarity sustain pulses of predetermined duration and predetermined voltage less than said breakdown voltage alternately to said cell, said sustain pulses causing said characteristic voltage to be stored at said cell in response to the storage of said first voltage thereat, thereby rendering said cell in a light-emitting state, and

third means for applying an inverting erase signal of predetermined voltage to said cell at said predetermined time, the sum of said inverting erase signal voltage and said characteristic voltage being greater than said breakdown voltage, and the sum of said inverting erase signal voltage and said first voltage being less than said breakdown voltage, whereby said inverting erase signal renders said cell in a non-light-emitting state only if said current state is said light-emitting state.

4,030,092

DIGITAL TO ANALOG CONVERTER USING RECIRCULATING SHIFT REGISTER

Paul Sieber, Heilbronn, and Joachim Kuhlmann, Heilbronn-Bockingen, both of Germany, assignors to Licentia Patent-Verwaltungs-G.m.b.H., Frankfurt am Main, Germany

Filed Aug. 13, 1974, Ser. No. 497,082

Claims priority, application Germany, Sept. 18, 1973, 2348831

Int. Cl.² H03K *13/02*

U.S. Cl. 340—347 DA **9 Claims**

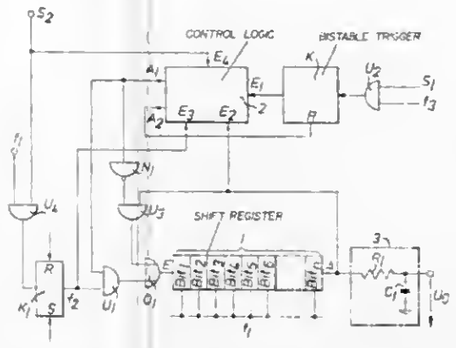
1. A digital/analog converter circuit for setting and varying electrical values comprising, in combination:

a shift register whose binary content corresponds to a defined value of an electrical parameter with the value of the electrical parameter being the ratio of the total number of logic "one" values in the register to the total number of logic "zero" values in the register;

a feedback line connected between the output and the input of said shift register;

means for continuously applying shift clock pulses of a first frequency to said shift register to cause the normally continuous circulation of the data in said register via said feedback line;

a logic circuit means for initially writing an alternating sequence of logic "zero" and logic "one" values, corresponding to the defined average of an electrical value, into said shift register and for thereafter selectively varying the ratio of the logic "one" and logic "zero" values circulating in said shift register to vary the digital content, said logic circuit means having a control logic means, and a means for changing the number of logic "zero" or one values contained in said shift register including: a first trigger stage for selectively providing a logic "one" or "zero" value at its output; a logic unit, which is controlled by said control logic means, connected between the output of said first trigger stage and the input of said shift register; and a second trigger stage triggered by means of



an input logic unit, which second trigger stage is connected to the input of said control logic means to control same when an input signal is present at said input logic unit; said control logic means being responsive to a single from said second trigger stage to trigger said logic unit to cause the conversion of the first circulating logic value in said shift register which is capable of conversion into the logic value appearing at the output of said first trigger stage;

and an analog integrating means connected to said output of said shift register for continuously integrating the signals appearing at said output of said shift register to continuously provide an output voltage whose magnitude corresponds to the digital content of said shift register.

4,030,093

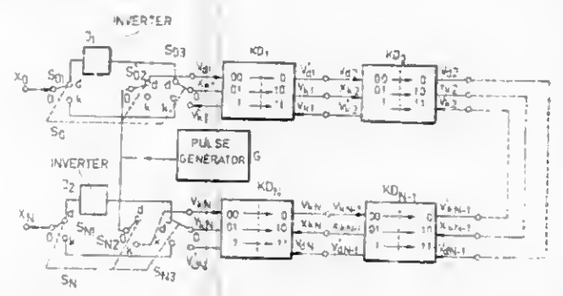
REVERSIBLE CODE COMPANDER

Jozsef Denes, and Mihaly Szokolay, Budapest, Hungary, assignors to Szamitastechnikai Koordinacios Intezet, Budapest, Hungary

Continuation-in-part of Ser. No. 281,016, Aug. 16, 1972, abandoned. This application May 9, 1974, Ser. No. 468,548

Int. Cl.² H03K *13/00*

U.S. Cl. 340—347 DD **1 Claim**



1. An arrangement for reproducing the original signal sequence from encoded binary contracted signal sequences comprising, in combination, a plurality of inverters; switching means connected to a common circuit point and to said inverters; a driving pulse generator connected to said common circuit point; a plurality of code transformers connected to said switching means having signal inputs and outputs, and having controlling inputs and outputs, the contracted encoded signal to be reproduced being applied to one of said inverters through said switching means for decoding by said inverters, said code transformers being connected in series, the signal output of any one code transformer being connected by pairs to the signal input of the subsequent code transformer, the output signal from the last code transformer being applied to another one of said inverters through said switching means for decoding by said other inverter after direct coding by said switching means, said pulse generator being connected to the controlling inputs of said code transformers through said switching means, said pulse generator being connected during decoding to the controlling input of the first code transformer through said switching means, said pulse generator being connected during encoding to the controlling input of the last code transformer through said switching means, the controlling inputs and outputs of said code transformers being interconnected by pairs, the encoding occurring in accordance with the rule 00 0, 1 11, 01 10, and the decoding occurring in accordance with the rule 11 1, 0 00, 10 01.

4,030,094

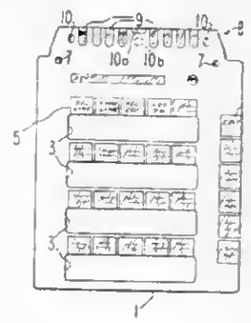
DEVICE FOR SELECTING COMPUTER OPERATIONAL MODE AND LABELING INPUT CONTROLS ACCORDINGLY

Richard C. Anderson, Los Altos, Calif., assignor to Varian Associates, Palo Alto, Calif.

Filed July 14, 1975, Ser. No. 595,946

Int. Cl.² G08C *1/00*

U.S. Cl. 340—365 R **2 Claims**



1. In an input/output station for a data processing system, said input/output station having a plurality of manually operable switches, THE IMPROVEMENT COMPRISING a translucent overlay receivable on said input/output station, said overlay including visible legend means for labeling said switches, and means on said overlay for optically encoding information, said input/output station having reader means to opto-electronically transduce said message into an electronic signal, said means for optically encoding including means for producing a signal indicative of receipt of said overlay on said input/output station and correct alignment therebetween.

4,030,095

PULSED ALARM SYSTEM

Edward Dalman, Arlington Heights, Ill., assignor to Honeywell Inc., Minneapolis, Minn.

Filed Jan. 19, 1976, Ser. No. 650,490

Int. Cl.² G08B *19/00*

U.S. Cl. 340—413 **10 Claims**

1. A pulse indicating system comprising:

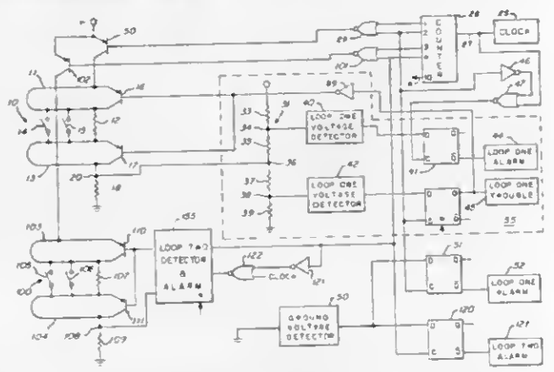
pulse source means for supplying energizing pulses and synchronizing pulses;

sensor means connected to be energized by said energizing pulses for providing a sensed output dependent upon a sensed condition;

voltage divider means comprising an impedance circuit having an input connected to receive said sensed output and first and second outputs, a high voltage detection

circuit having an input connected to said first output and having a first detection output, and a low voltage detection circuit havng an input connected to said second output of said impedance circuit and having a second detection output;

a first switch having a first input connected to said first detection output, a second input connected to receive said synchronizing pulses, and a switch output;



a second switch having a first input connected to said second detection output, a second input connected to receive said synchronizing pulses, and a second switch output; and,

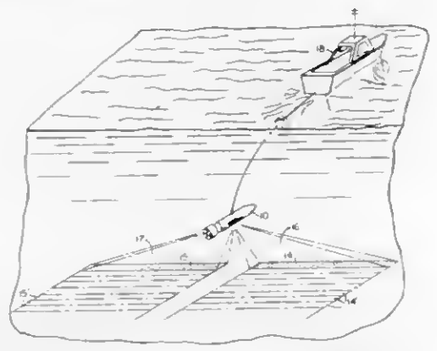
indicating means connected to said first and second switch outputs.

4,030,096

AUTOMATIC TARGET DETECTOR

Wesley E. Stevens, and Frederick Brimberg, both of Severna Park, Md., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Dec. 5, 1975, Ser. No. 637,999
Int. Cl.² G01S 9/02, 7/04, 9/66
U.S. Cl. 343—5 CM **12 Claims**



9. An automatic target detector for side-looking energy apparatus of the type which travels over a target area at an operating altitude and provides repetitive side-looking energy signals indicative of said target area, comprising:

A. means responsive to a side-looking energy signal for determining the presence of a target highlight and shadow, indicative of a possible target; and

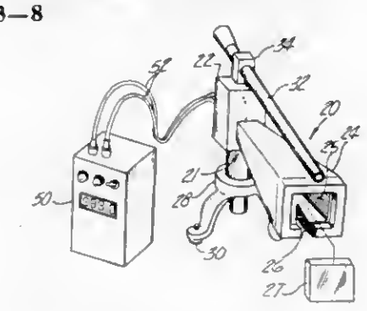
B. means for indicating the presence of said possible target only when the equivalent length S of said shadow is proportional to the range to said shadow by a predetermined factor.

4,030,097

MUZZLE VELOCITY CHRONOGRAPH

Anthony A. Gedeon, 508 Hull Ave., Lewisburg, Tenn. 37091

Filed Feb. 2, 1976, Ser. No. 654,246
Int. Cl.² G01S 9/44
U.S. Cl. 343—8 **13 Claims**



1. A chronograph for measuring the muzzle velocity of a projectile discharged from a firearm and in a portion of the trajectory, comprising:

electromagnetic wave energy source means at a predetermined frequency, f_1;

electromagnetic wave energy receiver means for receiving electromagnetic wave energy originating from the source means and reflected by the projectile at a frequency, f_2;

an electromagnetic wave antenna coupled to the source means and receiver means for illuminating the trajectory of the projectile with electromagnetic wave energy and receiving such energy as reflected by the projectile,

the electromagnetic wave antenna having a layer of sonic damping means disposed thereover to lower the resonant mechanical frequency thereof into a range near 0 to 10 Hz;

a mixer coupled to the source means and receiver means which has an output signal at a frequency f_d proportional to the difference between f_1 and f_2; and,

means for processing the mixer output signal to determine the muzzle velocity as a function of the frequency f_d.

4,030,098

METHOD AND MEANS FOR REDUCING REFLECTIONS OF ELECTROMAGNETIC WAVES

Maurice E. Nahmias, Ryswyk, Netherlands, assignor to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Mar. 26, 1962, Ser. No. 183,694
Int. Cl.² H01Q 17/00
U.S. Cl. 343—18 A **8 Claims**

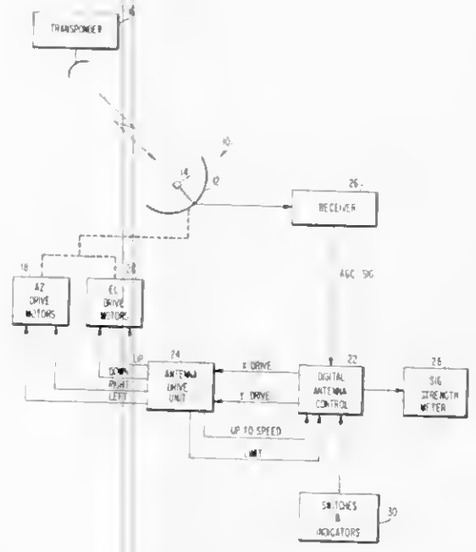
6. In combination with an aircraft having normally reflecting surfaces to radio frequency electromagnetic waves, a coating at singular places on its reflecting surfaces, said coating comprising a substance containing a radioactive material for creating a cloud of electrons in space to shroud said aircraft and provie attenuation to said rdio frequency electromagnetic waves incident thereon the distribution and concentration of said radioactive material producing a relatively uniform surface activity whose average value is in the order of 10 curies per square centimeter.

4,030,099

DIGITAL ANTENNA CONTROL APPARATUS FOR A COMMUNICATIONS TERMINAL

James V. Valenti, Laurel, Md., and Herbert Hanft, Alexandria, Va., assignors to Westinghouse Electric Corporation, Pittsburgh, Pa.

Filed Dec. 12, 1974, Ser. No. 532,277
Int. Cl.² G01S 3/42, 3/44
U.S. Cl. 343—117 R **12 Claims**



1. A system for controlling a directive antenna for a communications receiver to periodically slew said antenna to a quasi-stationary remote communications signal source wherein the system includes a directive electromagnetic wave antenna having electrical drive means coupled thereto for being driven preferably along two separate axes together with manual antenna control means coupled to said drive means for providing course acquisition of said antenna to said remote signal source and communication signal receiver means coupled to said antenna providing an output signal indicative of the signal strength received by said antenna from said remote signal source, the improvement comprising:

digital antenna control means coupled to said drive means for automatically providing fine acquisition of said antenna to said signal source following course acquisition on at least one of two separate axes in response to the received signal, said digital antenna control means including,

first means for periodically sampling said output signal from said receiver means and converting the samples resulting from said sampling into respective digital signal samples;

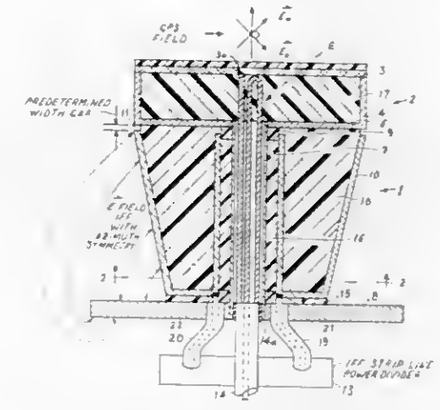
second means coupled to said conversion means for comparing one digital signal sample with the previous digital signal sample and generating a signal adapted to provide a continuous directional control signal coupled to said drive means in accordance with the comparison to cause said antenna to seek the maximum or peak signal strength of the received signal from said remote signal source and providing a stop command signal when a predetermined plurality of consecutive digital samples bear a predetermined value relationship to one another indicative that substantially maximum signal strength is being received by said antenna.

4,030,100

MULTIPURPOSE SUBMARINE ANTENNA

Emmanual Joseph Perrotti, Ramsey, N.J., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed Feb. 6, 1976, Ser. No. 655,812
Int. Cl.² H01Q 1/34, 1/36
U.S. Cl. 343—709 **18 Claims**



1. A multipurpose submarine antenna comprising:

an identification friend or foe (IFF) antenna disposed symmetrically about a vertical axis;

first means coupled to said IFF antenna to symmetrically feed said IFF antenna;

a global positioning satellite (GPS) antenna disposed coaxially of said vertical axis and above said IFF antenna;

a gap having a predetermined width disposed between the top of said IFF antenna and the bottom of said GPS antenna;

second means disposed coaxially of said vertical axis and within said IFF antenna to feed said GPS antenna; and

a conductive shield disposed coaxially of said vertical axis surrounding said second means and interconnecting said IFF antenna and said GPS antenna for isolation therebetween;

said GPS antenna including

a spiral radiator disposed coaxial of and perpendicular to said vertical axis, and

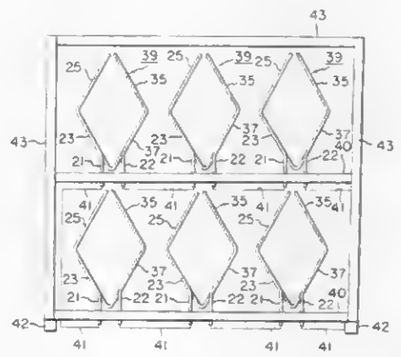
a cavity and ground plate disposed coaxial of said vertical axis and extending from and below said spiral radiator.

4,030,101

REGULAR EIGHT FACE POLYHEDRAL ANTENNA ELEMENT

Kazuhisa Satoh, 24-10-1 Megurohoncho, Meguro, Tokyo, Japan

Continuation-in-part of Ser. No. 503,699, Sept. 6, 1974, abandoned. This application Mar. 15, 1976, Ser. No. 667,154
Int. Cl.² H01Q 1/36, 1/42
U.S. Cl. 343—872 **7 Claims**



1. An antenna element comprising a single continuous length of electrically conductive metal bent into rectilinear

sections to form longitudinal edge lines defining the faces of a regular eight-face polyhedron-shaped antenna element, with the two ends of the continuous length of electrically conductive metal being bent outwardly at the bottom of said polyhedron to form electrical terminals of the antenna element; the length of each rectilinear section, with respect to a preselected frequency of transmission and reception, being equal to one half the wave length of the radiation at such preselected frequency.

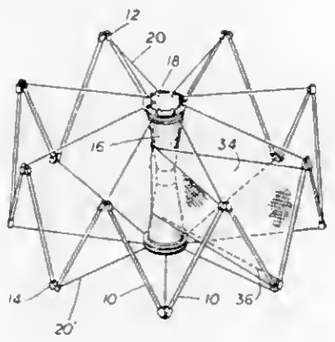
DEPLOYABLE REFLECTOR STRUCTURE

Richard Kaplan, East Meadow, and Jack L. Schultz, Huntington, both of N.Y., assignors to Grumman Aerospace Corporation, Bethpage, N.Y.

Filed Oct. 23, 1975, Ser. No. 625,210
Int. Cl.² H01Q *15/20*
U.S. Cl. 343—915 **10 Claims**



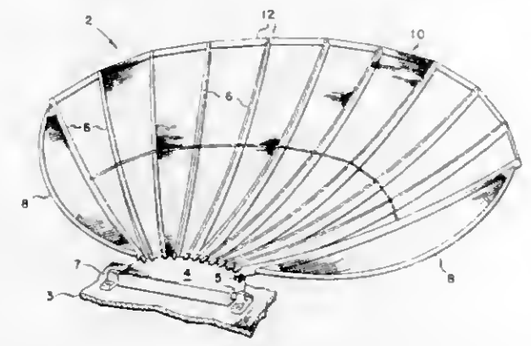
1. A process of deploying a structure to be a support for large surface devices, said process comprised of the steps:
unfolding a plurality of rim segments that are hinged to each other by means so as to permit mid span rotation and outward translation of each rim segment;
deploying spoke means between opposite ends of a central hub member to said rim segments to controllably limit said outward translation; and
removing panels from the central hub by the mid span rotation and outward translation to orient said panels to be the large surface device between the hub and the rim segments.

4,030,103

DEPLOYABLE OFFSET PARABOLOID ANTENNA

Gordon Kleth Colin Campbell, Los Altos, Calif., assignor to Lockheed Missiles & Space Company, Inc., Sunnyvale, Calif.

Filed Dec. 10, 1975, Ser. No. 639,236
Int. Cl.² H01Q *15/20*
U.S. Cl. 343—915 **2 Claims**



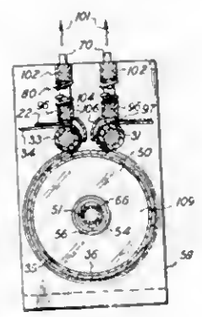
1. An antenna with a paraboloid shape which is fed from a feed in a position offset from the focal point of the paraboloid, said antenna deployable from a retractable stowed position to an extended deployed position, comprising:
a rigid generally semicircular support hub,
a number of radial ribs spaced about said support hub, each of said radial ribs including inner and outer ends,
a pair of rigid semicircular side supports attached to each of the outer radial ribs,
said radial ribs and said semicircular side supports defining an offset paraboloid when deployed,
inner hinge means pivotally joining the inner ends of said radial ribs to said support hub,
outer hinge means pivotally connected to the outer ends of each of said radial ribs,
foldable stiffeners connected to the outer hinge means of adjacent radial ribs for maintaining the adjacent ribs in a spaced apart relationship when the antenna is deployed, and
a preformed lightweight flexible metalized mesh stretched across and attached to said radial ribs and said semicircular side supports for forming a paraboloid shaped reflective surface when said antenna is deployed.

4,030,104

THERMO-MAGNETIC IMAGE TRANSFER APPARATUS

Stephen F. Pond, Fairport, N.Y., assignor to Xerox Corporation, Stamford, Conn.

Filed Nov. 12, 1975, Ser. No. 631,006
Int. Cl.² G11B *11/14, 5/027;* **G03B** *15/05*
U.S. Cl. 346—74.1 **6 Claims**



1. A thermoremanent transfer apparatus for thermomagnetically transferring an image from a slave web onto the magnetizable surface of the master web comprising:
a transparent cylindrical carriage means,
web transport means cooperating with said carriage means for transporting said slave web and said master web into intimate contact around substantially the entire periphery of said carriage means;
a radiation source located within said carriage means for producing a thermomagnetic transfer of the image from the slave web onto the master web, and;
energy deflecting means for reflecting energy from said radiation source onto the surface of said carriage means to provide a substantially uniform irradiation over the entire surface.

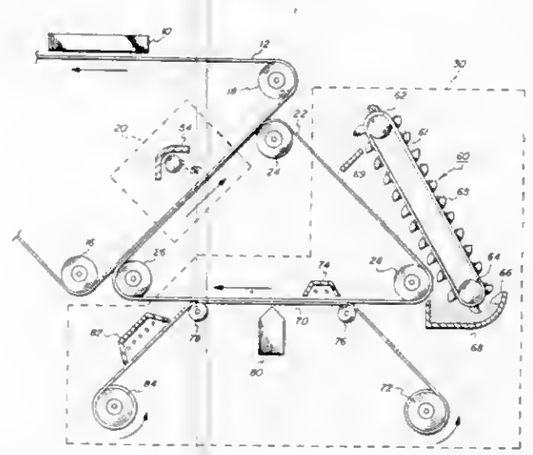
4,030,105

TECHNIQUE OF CHARACTER GENERATION ON MAGNETIC TAPES

Armand P. Neukermans, Palo Alto, Calif., assignor to Xerox Corporation, Stamford, Conn.

Filed Sept. 26, 1975, Ser. No. 617,137
Int. Cl.² G03G *19/00*
U.S. Cl. 346—74.1 **11 Claims**

1. A direct recording magnetographic system comprising:
a magnetic head assembly having multiple integrated recording elements,
a buffer web with a magnetizable surface;
means, controlling said magnetic head assembly, for directly writing a magnetic latent image onto the surface of the buffer web with multiple passes of said magnetic head assembly;
a copy web with a magnetizable surface;
means for transferring said magnetic latent image from the magnetic surface of the buffer web to the magnetic surface of the copy web;
means for developing said magnetic latent image on the copy web into a visual image; and



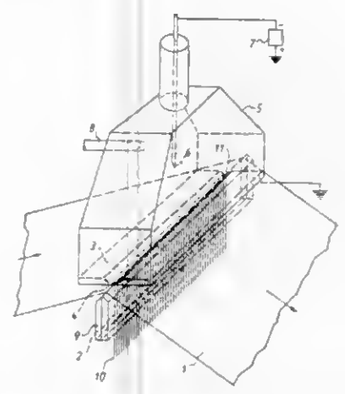
means for transferring said visual image to a hard copy output medium; wherein the ratio of the width of said magnetic head assembly to the width of said buffer web is substantially equal to the ratio of the magnetic writing speed of said head assembly to the development speed of said development means and transferring speed of said transferring means.

4,030,106

METHOD AND ARRANGEMENT FOR ELIMINATING UNDESIRED DENSITY VARIATIONS IN ELECTROSTATICALLY CREATED COPIES OF AN ORIGINAL

Friedrich Bestenreiner, Grunwald; Josef Helburger, and Wolfgang Ruf, both of Munich, all of Germany, assignors to AGFA-Gevaert, A.G., Leverkusen, Germany

Filed Sept. 22, 1975, Ser. No. 615,795
Claims priority, application Germany, Sept. 24, 1974, 2445543
Int. Cl.² G03G *15/044*
U.S. Cl. 346—153 **11 Claims**



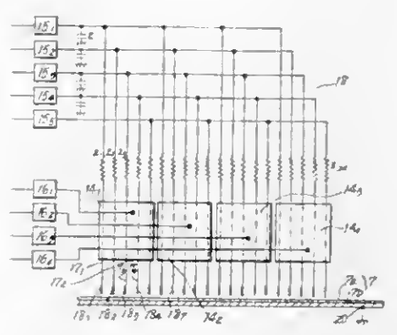
1. In a method of forming on a travelling recording medium an image of an original to be copied, wherein the original is scanned line-by-line and the scanning signals corresponding to one line are routed to respective ones of a plurality of recording channels, each recording channel being comprised of a writing electrode and a signal transmission channel leading to the writing electrode, the writing electrodes being disposed in a row extending transverse to the recording medium travel direction, the recording channels undesirably having non-identical characteristics tending to produce images containing perceivable stripes extending in the recording medium travel direction, a method of equalizing the operation of the recording channels so that such stripes will not appear, the equalizing method comprising the steps of applying identical test signals to the recording channels, using detector means to generate a plurality of error signals corresponding in a number to the recording channels and indicative of the lack of equality in the operation of the recording channels, in response to the application of the test signals, associating with the transmission channels a corresponding plurality of adjusting stages each operable for adjusting the transmission characteristic of the respective transmission channel, appplying the plurality of error signals to the plurality of adjusting stages to cause the latter to effect automatic errorsignal-dependent adjustments in the transmission characteristics of the transmission channels to equalize the operation of the plurality of recording channels and prevent the formation of such stripes.

4,030,107

ELECTROGRAPHIC RECORDING DEVICES EMPLOYING ELECTROSTATIC INDUCTION ELECTRODES

Takao Tagawa, Kashihara, Japan, assignor to Sharp Kabushiki Kaisha, Osaka, Japan

Filed Sept. 12, 1975, Ser. No. 613,033
Claims priority, application Japan, Sept. 12, 1974, 49-105614; Sept. 18, 1974, 49-108218; Sept. 20, 1974, 49-109198
Int. Cl.² G03G *15/044;* **G01D** *15/06*
U.S. Cl. 346—155 **7 Claims**



1. An electrostatic recording or printing device comprising:
a record medium on which a record image is to be disposed;
a record electrode spaced against the record medium to form a gap therebetween;
an electrostatic induction plate disposed over the record electrode or its associated lead wires and capacitively coupled thereto via insulation means;
an impedance element;
a pair of voltage sources switchable between first and second voltage levels, one being connected with the record electrode via the impedance element and the other being connected with the record electrode via the electrostatic induction plate, wherein the record electrode is activated by the sum of voltages from the first and second sources.

4,030,108
APERTURE SETTING DEVICE FOR CAMERA

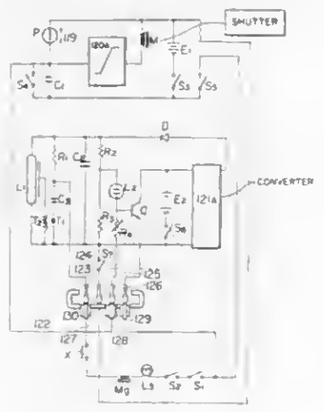
Mutsunobu Yazaki; Takashi Uchiyama; Mutsuhide Matsuda, all of Yokohama; Tetsuya Taguchi, Kawasaki, and Yukio Mashimo, Tokyo, all of Japan, assignors to Canon Kabushiki Kaisha, Tokyo, Japan

Continuation of Ser. No. 399,480, Sept. 21, 1973, abandoned. This application May 12, 1975, Ser. No. 576,441

Claims priority, application Japan, Sept. 25, 1972, 47-95997; Sept. 26, 1972, 47-96474

Int. Cl.² G03B 7/16

U.S. Cl. 354—27 4 Claims



4. An exposure control apparatus for a camera having an objective lens comprising:

electric flash means for producing a controlled quantity of light energy;

energy means coupled to said flash means for storing electric energy to be translated into the light energy in said electric flash means;

a first diaphragm to control a first aperture size of the objective lens of the camera;

a second diaphragm coupled to the first diaphragm to control a second aperture size;

light sensitive means within the camera for converting an amount of light passing through said second diaphragm into an electric quantity;

shutter control means in the camera for generating a shutter operating signal;

timing means in the camera for controlling said shutter control means for a time period dependent upon the output signal of said light sensitivie means;

first information means for establishing an aperture suitable for daylight photography;

second information means for entering at least the distance to an object being photographed so as to establish an aperture suitable for flash photography;

transmitting means alternatively connected with said first information means or said second information means so as to transmit the output signal of the connected one of said two information means to said second diaphragm;

control means coupled to said energy means for connecting said transmitting means with said second information means when an electric energy value of said energy means reaches a predetermined value and for connecting said transmitting means with said first information means when said electric energy value reaches a second predetermined value.

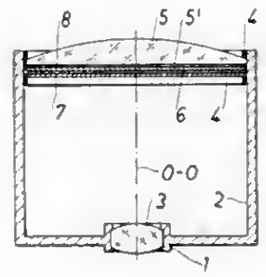
4,030,109
APPARATUS FOR CONTROLLING A PHOTOGRAMMETRICAL CAMERA

Gerhard Ernst Hecker; Heinrich Peter Klose, and Wilfried Friedrich Heinrich Muller, all of Jena, Germany, assignors to Jenoptik Jena G.m.b.H., Jena, Germany

Filed May 5, 1975, Ser. No. 574,995

Int. Cl. G03b 39/00

U.S. Cl. 354—68 3 Claims



1. An apparatus for control of a photogrammetrical camera, comprising

an imaging system,

a frosted glass arranged in the image plane of said imaging system,

said imaging system being adapted to image an object to be photographed onto said frosted glass,

a voltage sensitive material of variable optical transmissivity,

said material forming a plano-parallel sheet and being located adjacent to said frosted glass.

said sheet having a plurality of strip electrodes on one of its faces and a sheet electrode on the other of its faces,

an electronic counter,

each of said strip electrodes being connected to an output of said electronic counter,

and a tunable pulse generator connected to said counter,

said counter successively applying voltage pulses from said tunable pulse generator to said strip electrodes for producing potentials between said strip electrodes and said sheet electrode,

said pulse generator being adapted to control the frequency of said voltage pulses.

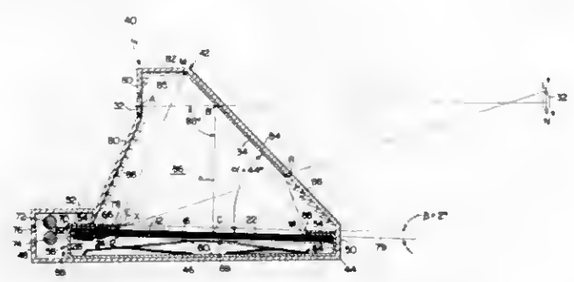
4,030,110
PHOTOGRAPHIC APPARATUS HAVING A REFLEX OPTICAL SYSTEM

Bruce K. Johnson, Andover, Mass., assignor to Polaroid Corporation, Cambridge, Mass.

Filed Mar. 3, 1975, Ser. No. 554,928

Int. Cl.² G03B 19/12

U.S. Cl. 354—152 15 Claims



12. A camera and film apparatus comprising:

a film unit having an exposure image area of a given length and width and further having the characteristic of reflecting a small portion of light rays thereonto;

a housing;

an objective lens having an optic axis and being mounted on said housing;

a mirror mounted within said housing for receiving image-bearing light rays from a scene being photographed which enter said housing through said lens, and for redirecting said image-bearing light rays; and

means within said housing for positioning said film unit to extend with the length of its exposure area disposed at an angle to said mirror so that the entire exposure area of said film unit is illuminated by said redirected image-bearing light rays, said film unit positioning means being disposed within said housing to locate said film unit at a focal plane of said lens;

said film unit positioning means being arranged and said mirror being disposed at an angle with respect to said optic axis of said lens such that the one ray of said image-bearing light rays travelling along said optic axis is redirected by said mirror onto said film unit at a point substantially coincident with the center of its exposure area and in a directon substantially normal to said film unit, said mirror being spaced from said film unit a predetermined distance, as measured along the line which said one ray travels after being so redirected by said mirror, so that all of the image-bearing light rays redirected by said mirror onto the exposure area of said film unit and reflected back therefrom onto said mirror are then redirected a second time by said mirror to locations within said housing that are outside of the exposure area of said film unit with the ones of said image-bearing light rays reflected by said film unit back onto the portion of said mirror closestmost disposed with respect to said film unit being redirected said second time by said mirror to a location within said housing substantially contiguous with the exposure area of said film unit.

4,030,111
POWER-OPERATED ACTUATOR FOR A FILM ADVANCE MECHANISM OF A CAMERA

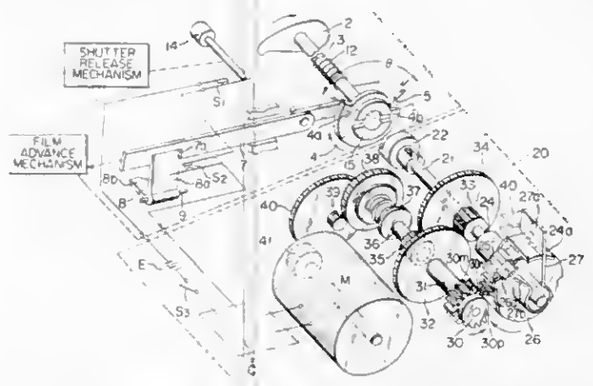
Shuji Kimura, Yokohama, Japan, assignor to Nippon Kogaku K.K., Tokyo, Japan

Filed Nov. 4, 1975, Ser. No. 628,652

Claims priority, application Japan, Nov. 13, 1974, 49-136562[U]

Int. Cl.² G03B 1/00

U.S. Cl. 354—173 12 Claims



1. In a camera having a film advance mechanism that includes a movable member for operating the mechanism, the combination of:

a. manually operable actuator means for manually moving the member;

b. motor driven actuator means for moving the member; and

c. means decoupling the motor of said motor driven actuator means from said member while said motor is de-energized and for automatically coupling said motor to said member in response to initial operation of said motor driven actuator means, whereby said manually operable actuator means is not loaded by said motor and whereby the motor starting load is substantially reduced.

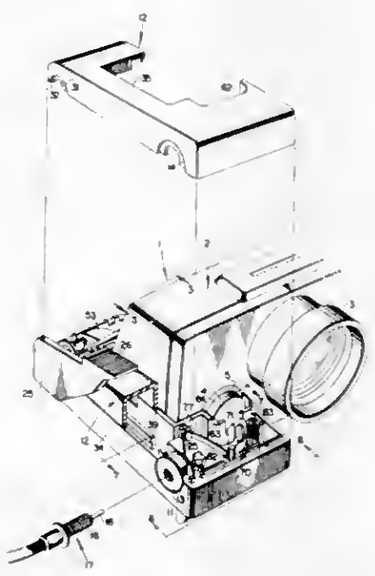
4,030,112
ACCESSORY ADAPTER FOR CAMERAS

John B. Morse, Boston; Donato F. Pizzuti, Saugus, and John M. Reynard, Framingham, all of Mass., assignors to Polaroid Corporation, Cambridge, Mass.

Filed Jan. 13, 1976, Ser. No. 648,653

Int. Cl.² G03B 17/38

U.S. Cl. 354—269 3 Claims



1. An adapter for connecting a cable release to a camera of the kind having a housing including a front panel on which a shutter actuating button is mounted, a side panel adjoining the front panel, and a rear panel adjacent the side panel and behind the front panel, the rear panel having a detent formed thereon, said adapter comprising means forming an adapter housing adapted to embrace the three panels of the camera, means forming a cable release socket in said adapter housing, force transmitting linkage extending in said adapter housing from said cable release socket to an opening in said adapter housing confronting the shutter actuating button of the camera when the adapter is in operative position on the camera, said force transmitting linkage comprising a lever in said adapter housing and having one end thereof terminating in a plunger adapted to engage the shutter actuating button of the camera, and a spring connected to said lever and adapted to be engaged by a push rod of a device coupled to said cable release socket to drive said plunger into shutter button actuating position but also to yield and allow further movement of the push rod should said plunger meet an obstruction.

CAMERA FITTING

Christo Obreschkow, 1507-805 W. Broadway, Vancouver, British Columbia, Canada (V5Z 1K1)

Filed Sept. 19, 1975, Ser. No. 614,945

Int. Cl.² G02B 7/04; G03B 15/02, 17/00

U.S. Cl. 354—286 9 Claims

1. A lens containing converter adapted to be removably interposed between the standard master lens and the body of a single lens reflex camera to permit the formation of close-up images comprising;

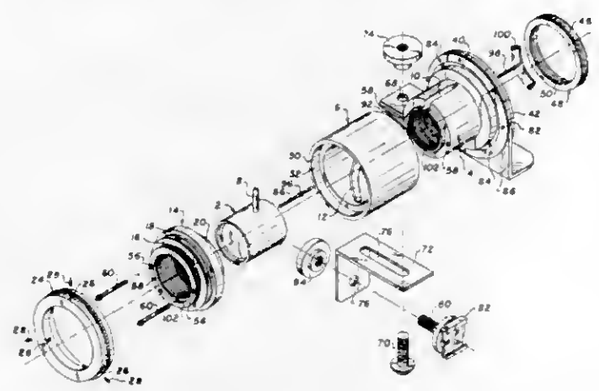
a lens system mounted in a lens carrier;

a sleeve in which the lens carrier can reciprocate;

means to determine the direction and extent of the reciprocation of the lens carrier within the sleeve and thus of the size of the image produced;

means at a first end of the lens containing convertor to

permit mounting of the lens containing convertor in place of the standard master lens of the camera; and



means at a second end of the lens containing convertor to permit mounting of said standard master lens on the lens containing convertor.

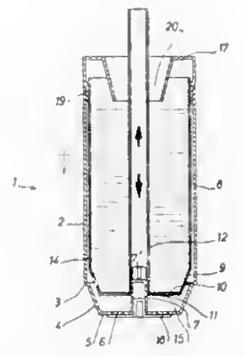
VERTICAL TANK FOR DEVELOPING PHOTOGRAPHIC MATERIAL

Claude M. Perriniaux, Auxerre, France, assignor to Anvar Agence Nationale de Valorisation de la Recherche, Neuilly sur Seine, France

Filed Nov. 12, 1975, Ser. No. 631,398
Claims priority, application France, Nov. 20, 1974, 74.38189
Int. Cl.² G03D *13/00*
U.S. Cl. 354—299 **11 Claims**



1. A vertical tank for the daylight development of sheet-type photographic materials comprising:

a. an outer tubular vessel having a closed bottom and open at its top;

b. an inner tubular vessel having a closed bottom, a space being formed between said vessels;

c. an annular chamber defined between said inner and outer vessels and adapted to receive the sheets to be treated;

d. a lower chamber defined between the closed bottoms of said inner and outer vessels and communicating with said annular chamber;

e. at least one closable conduit communicating with said lower chamber for the introduction of treatment solution into said lower chamber;

f. means for effecting the discharge of said solution from said lower chamber;

g. a lid for forming at least a light-tight recess defined by the space included between the two vessels and said lid; and

h. sliding means for axial motion of one of said vessels with respect to the other of said vessels for forcing the treatment solution introduced into said lower chamber into said annular chamber for development of the sheet-type photographic materials.

4,030,116

HIGH ASPECT RATIO P-N JUNCTIONS BY THE THERMAL GRADIENT ZONE MELTING TECHNIQUE

Samuel M. Blumenfeld, Schenectady, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Division of Ser. No. 411,151, Oct. 30, 1973, Pat. No. 3,897,277. This application May 16, 1975, Ser. No. 577,999
Int. Cl.² H01L *29/06, 29/04*
U.S. Cl. 357—32 **10 Claims**

1. A semiconductor device comprising

a body of single crystal semiconductor material having opposed major surfaces, a first type conductivity, a vertical axis and a selected resistivity;

an array of columnar regions disposed in the body substantially parallel to each other and the vertical axis of the body and substantially perpendicular to the two opposed major surfaces, each region extending between and terminating in the two major opposed surfaces and the material of the region consists of recrystallized semiconductor material of the body;

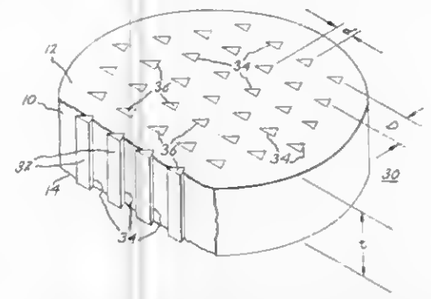
each region being formed in situ by the migration of a melt of a metal-rich semiconductor material through the body by thermal gradient zone melting at a predetermined elevated temperature along a thermal gradient substantially parallel with the vertical axis of the body and has a predetermined level of concentration of the metal of the melt therein as determined by the solid solubility limit of that metal in that semiconductor material at that predetermined elevated temperature of migration, the metal being distributed substantially uniformly throughout the

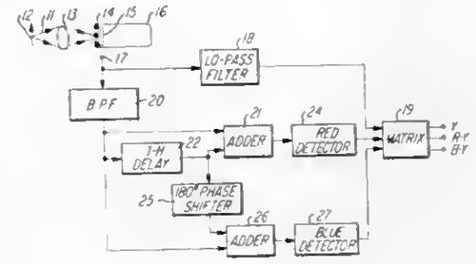
4,030,118

COLOR ENCODING CAMERA UTILIZING COMB FILTERING FOR COLOR SIGNAL SEPARATION

Robert Adams Dischert, Burlington, N.J., assignor to RCA Corporation, New York, N.Y.

Filed Feb. 11, 1970, Ser. No. 10,323
Int. Cl.² H04N *1/22, 9/07*
U.S. Cl. 358—5 **33 Claims**





entire region and comprising a dopant impurity material to impart a second and opposite conductivity thereto, and the metal is derived from a metal lead thermocompression bonded to the major surface from which migration is initiated;

a P-N junction formed by the contiguous surfaces of each region and the body, and

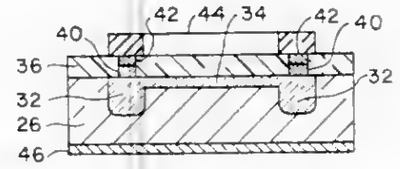
each region has a substantially equilateral triangular cross-section.

4,030,117

ZENER DIODE

Harry C. Kling, Boxford, Mass., assignor to International Telephone and Telegraph Corporation, Nutley, N.J.

Filed Mar. 10, 1975, Ser. No. 557,206
Int. Cl.² H01L *29/90, 23/02*
U.S. Cl. 357—13 **11 Claims**



1. A zener diode comprising

a body of semiconductive material having a first type of semiconductivity and opposed front and back surfaces;

a shallow junction region of a second type of semiconductivity formed in one surface of said body in pn-junction forming relation with said body;

a deep diffused region of a second type of semiconductivity formed in said one surface in contact with and about the entire periphery of the shallow junction region;

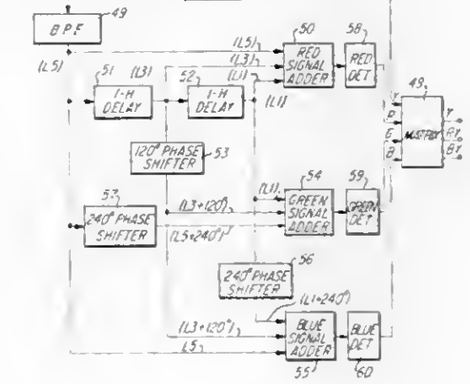
an insulating layer formed over said regions;

a metal contact means extending through the insulating layer and connected to and formed on the deep diffused region over the entire length of the region;

an electrical contact means formed on the other of said surfaces of the body of semiconductive material opposite from the one surface in which the shallow and deep diffused regions are formed;

first and second axially aligned electrodes disposed on opposite sides of said body of semiconductive material and in electrical contact with the previously mentioned contact means; and

a cylindrical sleeve of non-porous encapsulating material disposed about said electrodes and sealed thereto for encasing the body of semiconductive material.



11. A camera for encoding color information onto a black and white film for producing color representative signals when subsequently scanned, comprising:

a black and white film;

a striped spatial color encoding filter assembly disposed between said film and a scene;

means for imaging said scene and said color encoding filter assembly onto said film for encoding scene light and forming a record of said encoded light on said film;

said spatial color encoding filter assembly including first and second superimposed encoding gratings for encoding first and second colors, the direction of the stripes of said first grating being angularly disposed from the direction of the stripes of said second grating, the width of the stripes of said first and second gratings being selected such that subsequent scanning of said encoded film produces a signal including first and second carrier wave components resulting from scanning said first and second encoding gratings, respectively, the carrier frequency and sidebands of both groups of components having the same

frequency during a single line scanning interval, at least one of said carrier wave component groups having a phase change on successive scanned lines.

23. A system for producing signals representative of a scene, comprising:

an image scanning pickup device;

color encoding filter means disposed between said scene and a photosensitive electrode of said image pickup device for encoding light from said scene such that colored light information is derived as modulation of a composite signal derived from said image pickup device as said electrode is scanned,

said filter comprising three superimposed gratings for encoding three colors, the stripes of at least one of said gratings being angularly disposed with respect to the stripes of the other of said gratings, said stripes of each of said gratings having widths such that said composite signal includes a plurality of amplitude modulated color representative carrier wave components having the same frequency during a scanning interval,

at least two of said gratings having its stripes angularly disposed from the direction of scanning such that at least two component waves of said composite signal have a phase change on successively scanned lines; and

first, second and third signal processing means coupled to said image pickup device for combining signals derived from a plurality of scanning lines for producing signals representative of first, second, and third colors, respectively,

said first, second, and third signal processing means including means for delaying said signals for periods equal to the periods of one and two scanning lines for enabling said signals derived from a first and two next preceding scanning lines to be combined; and

said first, second, and third signal processing means including means for combining said signals derived from said three scanning lines in different phases for producing said first, second, and third color representative signals.

32. A system for producing signals representative of the color of a scene, comprising:

an image scanning pickup device;

striped spatial color encoding filter means comprising at least first and second gratings for encoding at least first and second colors, said gratings being disposed between said scene and a photosensitive electrode of said image pickup device for filtering the scene light reaching said electrode such that a composite signal representative of the color of said scene is derived from said image pickup device during scanning of said photosensitive electrode,

the encoding stripes of each said gratings being angularly disposed relative to the stripes of each other grating, said stripes of each of said gratings having a width such that said scanning produces said composite signal including a plurality of amplitude modulated color representative carrier wave components having the same frequency during a scanning interval; and

means coupled to said image pickup device for combining signals derived from a plurality of successively scanned lines for producing separate and simultaneous signals representative of a plurality colors.

VIDEO WINDOW CONTROL

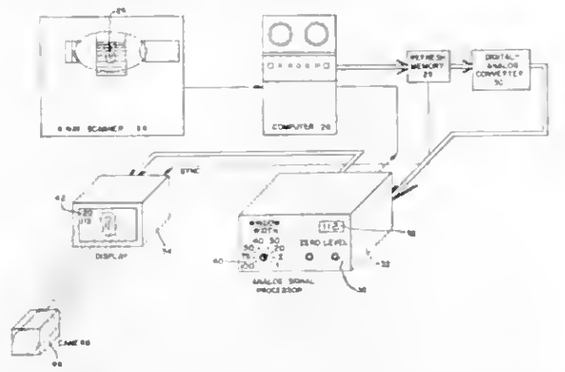
George W. Ellis, Burnt Hills, N.Y., assignor to General Electric Company, Schenectady, N.Y.

Filed Oct. 1, 1975, Ser. No. 618,682
Int. Cl.² H04N *7/18*; **H03K** *13/08*
U.S. Cl. 358—11 **14 Claims**

1. In an X-ray tomographic imaging system of the type comprising:

a source of radiation transmission data, a digital computer connected to receive said transmission data, and to calculate therefrom digital tomographic image data, a digital-to-analog converter connected to receive said digital image data and to produce therefrom a high resolution, analog image waveform, and an image display connected to receive and present a limited resolution analog image signal in an intensity modulated, visual format; the improvement comprising

an analog data processor connected to receive said high resolution image waveform and to convert said waveform into a limited resolution signal comprising an expanded function of those levels of said high resolution image waveform falling within the range of a selectable window function, said data processor including:



means for subtracting a reference level from said high resolution image waveform;

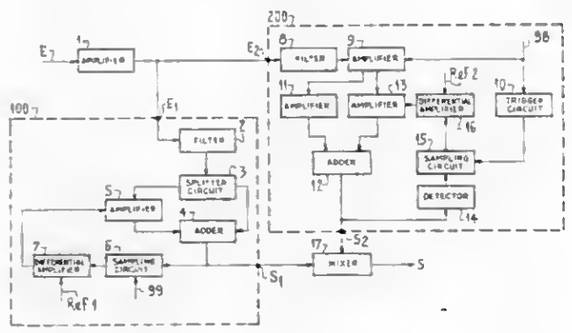
variable gain amplifier means connected to receive and increase the output of said means for subtracting; and

clipping means connected to act upon the output of said variable gain amplifier means whereby high level and low level data from said high resolution analog image waveforms are excluded from said limited resolution signal and the intensity resolution of said image display is selectively increased.

4,030,120
PROCESSING ARRANGEMENT AND CORRECTING DEVICE FOR COLOR TELEVISION SIGNALS

Luc Pham Van Cang, Paris, France, assignor to Thomson-CSF, Paris, France

Filed Dec. 17, 1975, Ser. No. 641,668
Claims priority, application France, Dec. 24, 1974, 74.42636
Int. Cl.² H04N *9/535*
U.S. Cl. 358—27 **6 Claims**



1. A processing arrangement for processing, prior to transmission or recording, a video frequency composite colour television signal including: horizontal sync. pulses, a chrominance information comprising a modulated chrominance sub-carrier outside the blanking intervals, and burst signals each of which is formed by a train of oscillations at the sub-carrier frequency and is transmitted in a horizontal blanking interval, and a picture signal, said arrangement comprising first and second processing circuits having respective inputs for receiving said composite signal, and respective outputs, said first circuit comprising first selecting means for selecting

said sync. pulses, and a first correcting circuit for receiving said sync. pulses and imparting thereto a predetermined amplitude, said second circuit comprising second selecting means, having an output, for selecting an upper portion, including said chrominance information, of the frequency spectrum of said composite signal, at least when said chrominance information is formed by said burst signals, and a second correcting circuit for receiving the output signal from said second selecting means and giving it a predetermined amplitude, said arrangement further comprising a mixer circuit having two inputs respectively coupled to said outputs of said first and second processing circuits, and an output for delivering a processed video frequency composite signal.

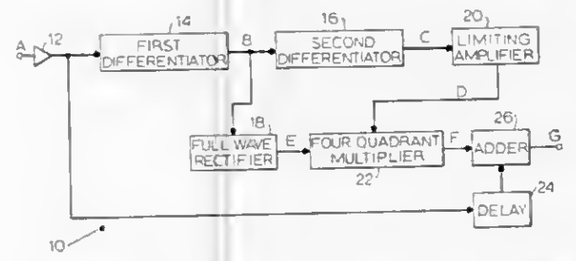
VIDEO CRISPENER

Yves C. Faroudja, 26595 Anacapa Drive, Los Altos Hills, Calif. 94022

Filed Dec. 2, 1975, Ser. No. 636,837
Int. Cl.² H04N *5/14*, *9/535*
U.S. Cl. 358—37 **28 Claims**



1. A method of shortening the transition time of transitions occurring in related high speed aperiodic signals including the steps of

differentiating a first related signal having transistions to be shortened to provide a first differential of said first signal,

twice differentiating a second signal which is related to said first signal to provide a second differential of said second signal,

producing a function of said first differential of said first signal,

producing a function of said second differential of said second signal,

multiplying said function of said first differential of said first signal by said function of said second differential of said second signal to produce a product,

delaying said first signal by a time factor equal to transit delay introduced in generating said product to provide a delayed first signal,

adding said product and said delayed first signal in phase to produce a sum which is the first signal having the transitions thereof shortened.

RECORDING APPARATUS UTILIZING SMALL OPTICAL COMPONENTS

Robert Guido Chemelli, Morristown; Dwight Dexter Cook, New Providence, and Richard Carrel Miller, Summit, all of N.J., assignors to Bell Telephone Laboratories, Incorporated, Murray Hill, N.J.

Filed July 28, 1975, Ser. No. 599,850
Int. Cl.² H04N *5/76*
U.S. Cl. 358—127 **10 Claims**

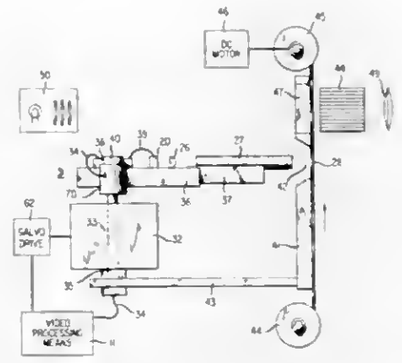
1. Appartus for forming an image in the form of discrete holes on a recording medium in response to an input signal representing video information comprising:

a laser medium adapted to emit pulses of coherent radiation in the form of an astigmatic elliptical beam in response to said input signal;

means for focusing said radiation onto said recording medium comprising an optical fiber with a parabolic radial index of refraction;

a hemicylindrical lens interposed between said laser and said optical fiber with the flat surface of said lens facing said laser, said hemicylindrical lens having a radius and being positioned at a distance from said laser so as to convert said radiation into an approximately nonastigmatic circular beam;

said laser, optical fiber and hemicylindrical lens being



mounted on a support which is capable of being deflected over a prescribed arc by rotation about an axis of said support;

means for conforming the recording medium to an arc concentric with the arc defined by said support; and

means for periodically deflecting said support in one direction from an initial position across the prescribed arc so as to scan a line of said recording medium and in the opposite direction to return the support to its initial position.

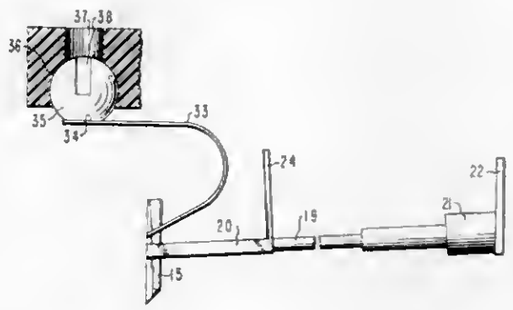
STYLUS ADJUSTMENT APPARATUS FOR A VIDEO DISC PLAYER

Byron Kent Taylor, Indianapolis, and James Austin Allen, Monrovia, both of Ind., assignors to RCA Corporation, New York, N.Y.

Filed Mar. 16, 1976, Ser. No. 667,396
Claims priority, application United Kingdom, Sept. 18, 1975, 38458/75; Nov. 28, 1975, 49107/75
Int. Cl.² H04N *5/76*
U.S. Cl. 358—128 **9 Claims**



1. In a system for playing back prerecorded signals from a spirally-grooved and rotatable record, said system including a carriage mounted for lateral motion relative to a base plate of said system in correlation with lateral motion of a groove-riding stylus during playback; an apparatus comprising:

A. a stylus arm carrying said stylus at one end thereof;

B. means for flexibly supporting the end of said stylus arm remote from said one end within said carriage;

C. a spring for urging said stylus into said record groove during playback; said spring having a first end and a

second end; said first end of said spring being secured to said stylus; and

D. means mounted within said carriage and secured to said second end of said spring for adjusting the location of said second end of said spring.

VIDEO DISC PLAYBACK SYSTEM AND PICKUP CARTRIDGE THEREFOR

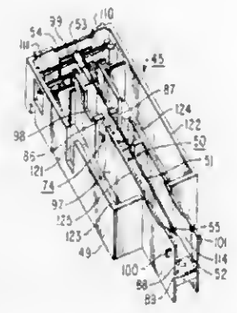
James Austin Allen, Monrovia, Ind., assignor to RCA Corporation, New York, N.Y.

Filed Mar. 16, 1976, Ser. No. 667,420

Claims priority, application United Kingdom, Sept. 18, 1975, 38458/75; Nov. 28, 1975, 49108/75

Int. Cl.² H04N *5/76*

U.S. Cl. 358—128 **11 Claims**



1. In a system for playing back prerecorded signals from a spirally grooved and rotatable record; said system including a carriage mounted for lateral motion relative to a base plate of said system in correlation with lateral motion of a groove-riding stylus during playback; said system further including a support member located within said carriage; an apparatus comprising:

A. a stylus arm unit including:

a. a stylus arm carrying said stylus at one end thereof.

b. a connector plate; and

c. a compliant member securing said connector plate to the other end of said stylus arm;

B. a cartridge having walls defining a protective enclosure for said stylus arm unit; said cartridge being subject to reception in a compartment provided in said carriage;

C. means for releasably clamping said stylus arm in a retracted position in said cartridge; said retracted position providing a location for said stylus withdrawn within the confines of said cartridge remote from an opening in the bottom of said cartridge through which said stylus may otherwise protrude;

D. means for flexibly suspending said connector plate within said cartridge; said suspending means establishing a location of said connector plate permitting alignment thereof with said support member when said cartridge is received in said compartment; said suspending means including a flexible diaphragm; said suspending means further including means for securing said diaphragm to said cartridge; a rear surface of said flexible diaphragm being oriented at a certain angle with respect to a front surface of said flexible diaphragm; said connector plate being secured to said rear surface; said cartridge having a bearing surface for engagement with said front surface to establish location of said front surface in said cartridge; and said certain angle being such that said compliant member is unstressed when said stylus arm is retained in said retracted position in said cartridge during said engagement of said front surface of said diaphragm with said bearing surface of said cartridge.

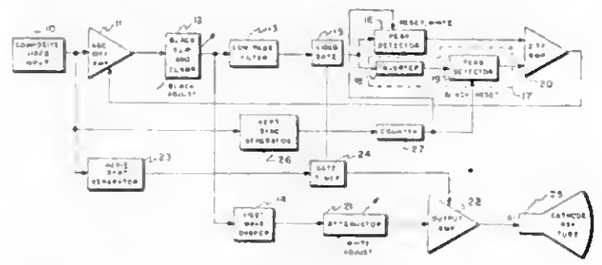
AUTOMATIC VIDEO PROCESSING FOR HIGH-PERFORMANCE CRT DISPLAYS

Robert J. Bedell, Arlington, Tex., and Richard E. Franseen, Springfield, Va., assignors to The United States of America as represented by the Secretary of the Army, Washington, D.C.

Filed Dec. 16, 1976, Ser. No. 751,296

Int. Cl.² H04N *5/14*

U.S. Cl. 358—169 **4 Claims**



1. A video processor including a gain-controlled amplifier having a composite video input, a control input, and an output; an adjustable clipper-clamper having an output and having an input connected to said output of said amplifier; a video gate having a control input, a video input, and a video output; a resettable peak video signal detector having an output and a reset input, and having a signal input connected to said video output of said gate; a resettable minimum video signal detector having an output and a reset input and having an input connected to said video output of said gate; a difference detector having an output and having individual inputs connected to said outputs of said peak and minimum video signal detectors, said difference detector output being connected to said control input of said gain-controlled amplifier; video waveshaping means having an input connected to said output of said clipper-clamper and having an output; a gated video output amplifier having a gain input, a video input, and an output; gate control means having a composite video input and having an output connected to said gate inputs of said video gate and said gated video output amplifier; detector reset means having a composite video input and having an output connected to said reset inputs of said detectors; and a cathode ray tube having a video input terminal connected to said output of said video output amplifier.

4,030,126

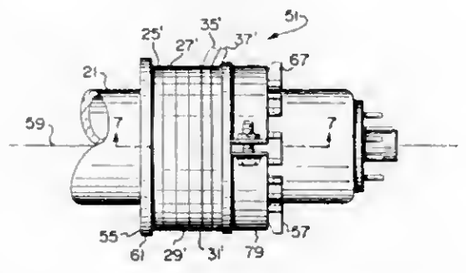
SUPPORT MEANS FOR A CRT BEAM ADJUSTMENT DEVICE

Peter George Puhak, Seneca Falls, N.Y., assignor to GTE Sylvania Incorporated, Stamford, Conn.

Filed Jan. 16, 1976, Ser. No. 649,684

Int. Cl.² H04N *5/645*; **H01F** *7/02*

U.S. Cl. 358—248 **8 Claims**



1. Support means for exteriorly positioning and retaining a beam adjustment device formed a plurality of sequentially oriented annulate magnetic members on the neck portion of a cathode ray tube, said support means comprising:

a cylindrical support sleeve formed of insulative material having substantially opposed alpha and beta end portions and a longitudinal axis therethrough, said sleeve having an internal diameter to facilitate sliding placement on said neck portion and an external diameter dimensioned to accommodate said annulate members positioned thereon, said alpha end portion having a terminus formed as an outstanding circumferential member to provide stop means for said annulate members, said beta end portion of said cylindrical sleeve having a plurality of spaced apart longitudinal slits therein oriented parallel with said axis to form a plurality of substantially similar tongue-like extensions of said sleeve, each of said extensions having at least one terminally oriented protuberance formed to extend radially outward therefrom to effect an outstanding circular array around the beta end of said sleeve, the surface of each protuberance oriented toward said annulate members being an angularly related surface sloping toward the body of said sleeve;

a spacer ring dimensioned for sliding placement upon said sleeve, said ring being positioned thereon between said protuberances and said annulate members; and

a ring-type band clamp having associated adjustable means and a circumferential dimensions less than that of said annular array of protuberances and greater than that of said sleeve, said band clamp being positioned between said protuberances and said spacer ring in a manner to abut said ring and ride on said sloping surfaces of said protuberances to simultaneously exert longitudinally directed pressure to positionally lock said annulate rings and circumferentially directed pressure to affix said support means upon said neck.

4,030,127

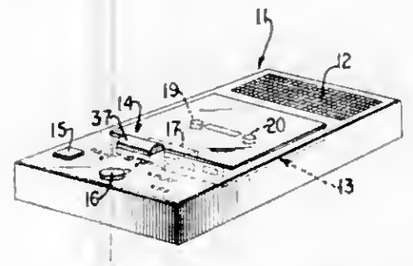
AUDIO TAPE PLAYER DRIVER INFORMATION DEVICE

Harry Newman, Main St., Box 141, South Fallsburg, N.Y. 12779

Filed May 14, 1975, Ser. No. 577,313

Int. Cl.² G11B *5/00, 15/06*

U.S. Cl. 360—12 **2 Claims**



1. In an audio tape device having a speaker and an audio tape energized transducer means connected to said speaker for providing a prerecorded informative message to a listener, the combination including means for receiving a reversable two track audio tape having reversed indicia and spaced information thereon for energizing said speaker when said tape is moved relative to said transducer, transport means for moving said tape relative to said transducer, manual reciprocable button means for energizing said transport means, said manual means having solenoid releasable locking means effective for one track only for holding said manual means in a tape device energized mode after said manual means is moved to energize said transport means, and portions of said tape indicia being insulative and portions being electrically conductive for releasing said locking means at the end of a message, and optical viewing means including a reflective mirror and adjacent prism means whereby the indicia is reflected by said mirror for enlarging by and viewing through said prism.

4,030,128

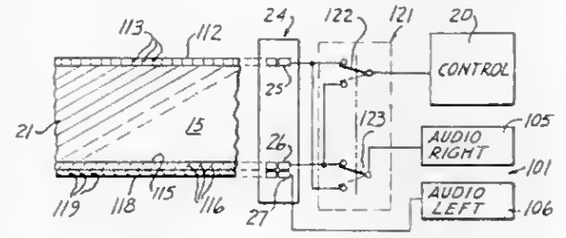
VIDEO RECORD SCRAMBLING AND UNSCRAMBLING

Ludwig A. Perret, La Canada, Calif., assignor to Bell & Howell Company, Chicago, Ill.

Filed Nov. 21, 1974, Ser. No. 526,019

Int. Cl.² H04N *5/76, 1/44*

U.S. Cl. 360—33 **24 Claims**



1. A method of scrambling a video information recording of a type having video information and a video information playback synchronization control signal recorded on a recording medium, with said playback control signal being normally in that type of recording recorded in a first track positioned on the recording medium for playback by a specifically positioned playback device in a standard video information playback apparatus for a control of the video information playback, and said video information being normally in that type of recording recorded in a slant-track pattern oriented in a predetermined manner on said recording medium, comprising in combination the steps of:

recording said video information on one side of said recording medium in said slant-track pattern being oriented in said predetermined manner; and

switching the recording of said video information playback control signal on said one side of said recording medium from said first track to a second track different from said first track and spaced from said specifically positioned playback device during playback in said standard video information playback apparatus sufficiently to miss the synchronization control signal playback device if said recorded video information and control signal were attempted to be played back from said medium in a standard video information playback apparatus.

4,030,129

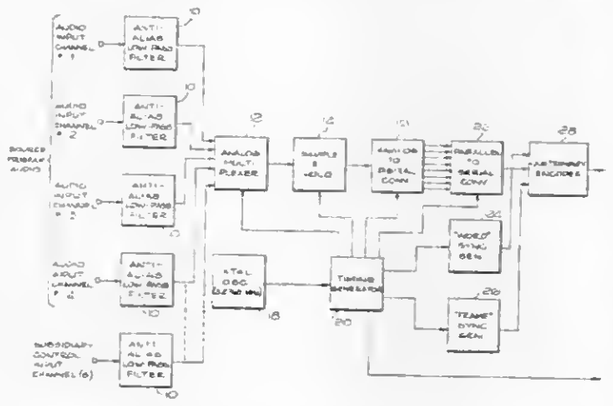
PULSE CODE MODULATED DIGITAL AUDIO SYSTEM

William E. Whitlock, Sherman Oaks, Calif., assignor to Lase Industries, Van Nuys, Calif.

Filed June 14, 1976, Ser. No. 696,156

Int. Cl.² G11B *5/00, 5/62*

U.S. Cl. 360—32 **26 Claims**



1. A system for minimizing discernable output discontinuities in reproducing digitally transmitted samples of continuous analog signals comprising:

means for receiving successive multibit digital words indica-

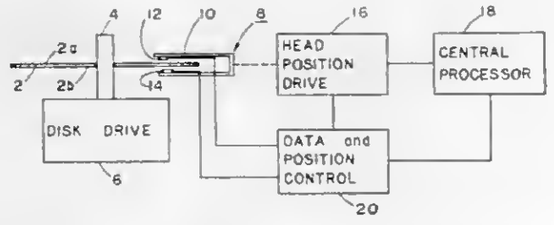
tive of the instantaneous amplitude value of successive samples of the analog signal;
memory means for entering each successive digital word received to be stored in one of a sequential plurality of word address positions;
dropout detector means for sensing a selected characteristic of the transmitted signal being received to generate an error signal indicative of transmission deficiencies;
memory address means responsive to said error signal for interrupting the normal sequence of entry for said digital words being received and for reading out from said address positions previously entered data words in the reverse sequence of their entry;
digital to analog converter means for receiving either the digital words being entered in forward sequence or digital values derived from the digital words being read out in reverse sequence from the memory means to generate analog values corresponding to successive samples of the continuous analog signal; and,
controlled low pass filter means providing a selectively variable cut-off frequency that decreases gradually from a maximum audio level in response to said error signal and that is gradually restored to or maintained at the maximum level during the absence of said error signal.

4,030,130

TRANSDUCER HEAD ASSEMBLY AND APPARATUS FOR USING SAME IN A PLURAL- TRACK RECORD DISK SYSTEM

Douglas A. Smith, Fife, Scotland, assignor to Burroughs Corporation, Detroit, Mich.

Filed Nov. 27, 1974, Ser. No. 527,896
Claims priority, application United Kingdom, Mar. 15, 1974, 11610/74
Int. Cl.² G11B *21/10*
U.S. Cl. 360—77 **11 Claims**



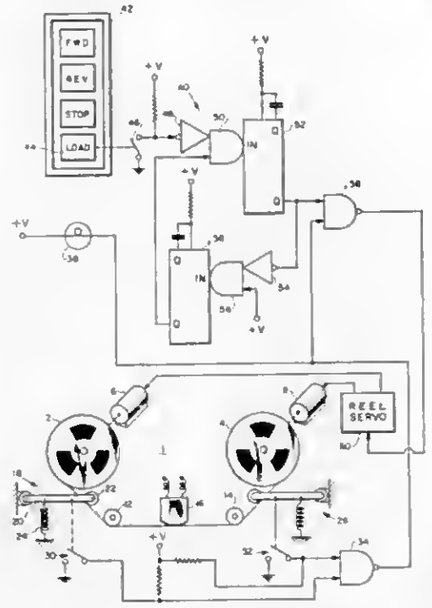
1. Apparatus for use in recording, reproducing or erasing data, comprising:
a record disk having a plurality of equally-spaced, radial, recording tracks on both faces thereof, tracks on one side being correspondingly, equal-radially spaced with respect to respective tracks on the other side, and variable informational data being recorded onto said tracks at different clock frequencies with respect to adjacent tracks;
support means;
an upper transducer head carried by said support means and cooperable with the upper face of said disk for reading or writing informational data from or onto said tracks;
a lower transducer head carried by said support means and cooperable with the lower face of said disk for reading or writing informational data from or onto said tracks, said lower transducer head fixed in a radially spaced relationship from said upper head with respect to said disk by one-half the distance between pairs of adjacent of said equally spaced tracks; and
means for centering either one of said heads with a said track by correspondingly centering other of said heads between two adjacent of said tracks on the opposite face of said disk, said means comprising:
1. means for separating reproduced data from said other head according to said different clock frequencies of said two adjacent tracks;
2. Means for comparing the amplitude of said separated reproduced data; and
3. Drive means responsive to said comparing means for driving said heads radially with respect to said disk for maintaining equal amplitude comparison by said amplitude comparison means.

4,030,131

SLACK TAPE LOADER

Glenn A. Belter, Louvlers, and Donald A. Evert, Littleton, both of Colo., assignors to Honeywell Inc., Minneapolis, Minn.

Filed Aug. 20, 1975, Ser. No. 606,231
Int. Cl.² G11B *15/43*; **B65H** *59/38*
U.S. Cl. 360—71 **10 Claims**



1. A tape transport control system comprising
a pair of tape storage reels,
a pair of reel drive motors for driving respective ones of said storage reels,
a reel motor control system connected to said drive motors to supply energizing signals thereto,
means for detecting a slack condition in a tape driven by the tape transport between said storage reels to supply signals representative of said slack condition, and
selectively operable signal generator means responsive to said signals from said last-mentioned means and connected to said reel motor control system for providing a selectively operable signal generating capability to produce a succession of control signals for said reel motor control system with each control signal having a predetermined duration for energizing said reel motor control system for said predetermined duration to drive said reel motors to remove said slack condition in said tape.

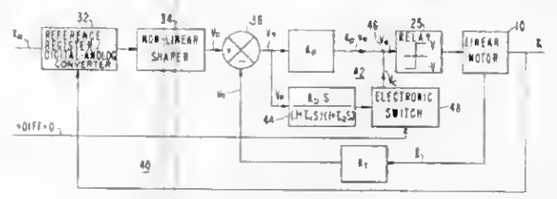
4,030,132

DUAL MODE VELOCITY SERVO CONTROL FOR A LINEAR ACTUATOR MOTOR

Syed H. Iftikar, San Jose, and Bing M. Leong, Sunnyvale, both of Calif., assignors to Memorex Corporation, Santa Clara, Calif.

Filed Mar. 27, 1975, Ser. No. 562,682
Int. Cl.² G11B *5/56*, *21/08*, *17/00*
U.S. Cl. 360—78 **13 Claims**

7. In a servo control system for controlling the movement of at least one magnetic transducer head relative to a rotating magnetic disc surface by means of a linear actuator motor having position and velocity modes of control, said servo control system having a velocity error signal and wherein the improvement comprises anticipatory mode means for deriving a compensatory signal proportional to the rate of change of



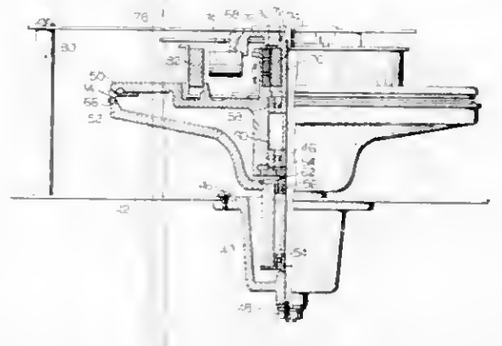
the velocity error signal in the operating frequency range of the system, and means responsive to both the servo error signal and compensatory signal for control of the linear actuator motor.

4,030,133

GUIDE DRUM APPARATUS FOR A VIDEO TAPE RECORDER AND/OR PLAYER

Klichiro Yamada, Nishinomiya; Isao Kozu, Katano; Takenori Akamine, Osaka, and Ryota Shimizu, Katano, all of Japan, assignors to Matsushita Electric Industrial Co., Ltd., Kadoma, Osaka, Japan

Filed Sept. 9, 1975, Ser. No. 611,601
Claims priority, application Japan, Sept. 18, 1974, 49-108244
Int. Cl.² G11B *5/52*, *21/18*
U.S. Cl. 360—84 **4 Claims**



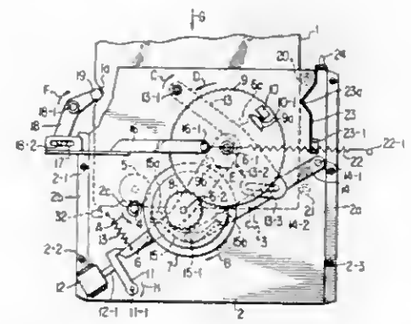
1. A guide drum apparatus for a video tape recorder and/or player in which a field or a frame of video signal is recorded in the longitudinal direction of a moving magnetic tape, and the recorded video signal is reproduced while the tape is moving, said apparatus comparising:
a main shaft fixedly secured on a chassis;
a first guide drum rotatably mounted on said main shaft and having a tape guiding surface on the periphery thereof and a plurality of magnetic video heads mounted thereon;
driving means coupled to said first guide drum for rotating said first guide drum at a rotational speed greater than the speed of movement of the tape;
a second guide drum mounted on said fixedly secured main shaft coaxially with said first guide drum and having a tape guiding portion at the periphery thereof which is opposed to the tape guiding portion of said first guide drum in the direction of the axis of said shaft so as to guide the magnetic tape together with said tape guiding surface on said first guide drum, said second guide drum being rotatable independently from said first guide drum at a lower rotational speed than that of said first guide drum according to the movement of the tape and due to the friction between the tape and the tape guiding portion of said second guide drum while said first guide drum is rotating at said greater rotational speed, whereby while moving around said guide drums the magnetic tape is scanned by said magnetic heads; and
adjusting means mounted on said fixedly secured main shaft and movable in a longitudinal direction of said fixedly secured main shaft for adjusting the height position of said magnetic video heads relative to the tape guiding portion of said second guide drum even while said first guide drum is rotating.

4,030,134

APPARATUS FOR TURNING ROTOR FOR EACH DESIRABLE ANGLE BY DRIVING FORCE OF CAPSTAN DRIVE SYSTEM

Itsuki Ban, Higashi-Oizumi; Takanori Kasuya, Kodaira; Kanji Yano, Higashi-Murayama, and Kenichi Maruyama, Toyoshima, all of Japan, assignors to Itsuki Ban, Tokyo, Japan

Filed Nov. 25, 1975, Ser. No. 635,146
Claims priority, application Japan, Nov. 27, 1974, 49-135524
Int. Cl.² G11B *21/08*, *15/08*
U.S. Cl. 360—92 **4 Claims**



1. An apparatus for turning a rotary element, of a tape cartridge insertion and removal system, for each desirable angle by a capstan drive system which comprises:
a lever turnable about a pivot bearing at one end thereof, the other end being free;
an eccentric free travelling ring carried by said turnable lever at a point revoved from said pivot end thereof so as to be contactable and discontactable from a rotary shaft of said capstan drive system;
a small gear connected to said free travelling ring;
a rotary element drivingly engaged with said small gear for reducing the rotation thereof and being pivotally mounted on said pivot bearing of said turnable lever;
lever means operatively associated with said rotary element at one end thereof and operatively engageable with said tape cartridge at the other end for permitting and forcefully ejecting said tape cartridge from a cartridge housing mounted on a tape deck, or for preventing the ejection of said cartridge from said housing, depending upon the rotary position of said rotary element;
means for biasing said free travelling ring toward said rotary shaft of said capstan drive system;
electromagnetic control means for interlocking the free end of said turnable lever so as to prevent contact of said free travelling ring with said rotary shaft of said capstan drive system; and
means for actuating said electromagnetic control means for releasing the interlock of said free end of said turnable lever so as to permit contact of said free travelling ring with said rotary shaft of said capstan drive system.

4,030,135

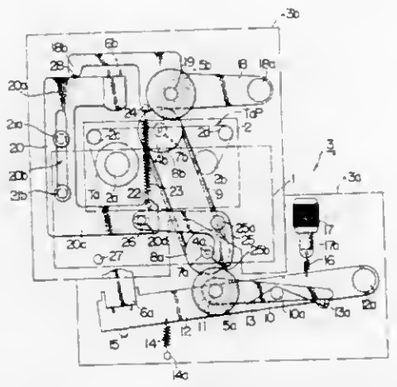
DUAL CASSETTE TAPE RECORDER

Sinichi Saitou, Ishikawa, Japan, assignor to Olympus Optical Co., Ltd., Tokyo, Japan

Filed Nov. 17, 1975, Ser. No. 632,861
Claims priority, application Japan, Nov. 20, 1974, 49-133459; Nov. 20, 1974, 49-140410[U]
Int. Cl.² G11B *23/04*, *21/12*
U.S. Cl. 360—94 **20 Claims**

1. A dual cassette tape recorder including:
1. a primary recorder comprising:

A. first and second capstans;
B. a first pinch roller moveable between a first position wherein said first pinch roller is out of operative engagement with said first capstan and a second position wherein said first pinch roller is in operative engagement with said first capstan;
C. first receiving means for selectively receiving a compact cassette or an adaptor, said first receiving means adapted to position a tape contained in a compact cassette between said first capstan and said first pinch roller when a compact cassette is placed in said first receiving means;
2. said adaptor comprising:
A. a second pinch roller moveable between a third position wherein said second pinch roller is out of operational engagement with said second capstan when said adaptor is placed in said first receiver means and a fourth position wherein said second pinch roller is in operational engagement with said second capstan when said adaptor is placed in said first receiver means;
B. second receiver means for receiving a micro-cassette and for positioning a tape contained in said micro-cassette between said second pinch roller and said second capstan when a micro-cassette is placed in said second receiver means;
C. means coupling said first pinch roller to said second pinch roller when said adaptor is placed in said first receiver means, said coupling means for moving said second pinch roller into said fourth position in response to movement of said first pinch roller towards said second position.



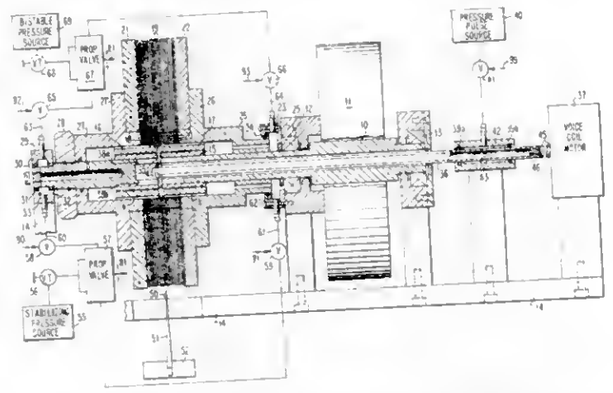
4,030,136

FLEXIBLE DISK PACK ACCESSING APPARATUS AND METHOD

James Taylor Smith, Boulder, Colo., and Frank Eberhard Talke, Morgan Hill, Calif., assignors to International Business Machines Corporation, Armonk, N.Y.

Filed Feb. 13, 1976, Ser. No. 658,134
Int. Cl.² G11B *5/012, 23/02*
U.S. Cl. 360—98 **13 Claims**

1. A record storage appartaus comprising, in combination,
a pack of closely spaced coaxially arranged interconnected rotary flexible disks,
means for normally supplying pressure fluid at a preselected flow rate to interstices between said disks to maintain the pack, during rotation, in a normal condition in which the disks are substantially parallel,
means for splitting said pack at a selected axial position to cause disks at each side of the split to be deflected apart and assume respective diverging positions, and
a movable means concentrically disposed within the pack and positioned at said selected position for sealingly isolating the interstices at one side of the split from those at the opposite side,
the first-mentioned means including means for providing pressure fluid at a flow rate higher than said preselected flow rate to one side of the movable means for restoring



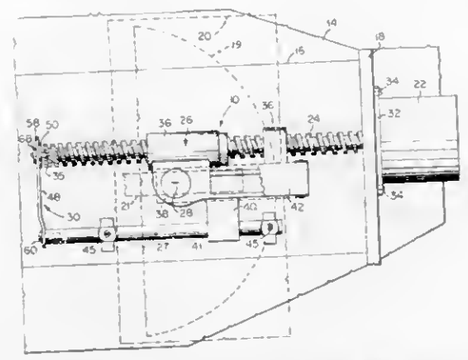
disks at said one side to substantially parallel positions while disks at the opposite side remain in their diverging positions.

4,030,137

LEAD SCREW SUPPORT DAMPING MECHANISM

Warren L. Dalziel, Monte Sereno, Calif., assignor to Shugart Associates, Inc., Sunnyvale, Calif.

Filed Sept. 23, 1975, Ser. No. 615,940
Int. Cl.² G11B *3/12, 5/58, 21/08*
U.S. Cl. 360—106 **10 Claims**



1. A magnetic read/write head-positioning apparatus comprising:
a frame;
a stepping motor mounted to said frame;
a cantilevered lead screw having one end mounted to the drive shaft of said motor and the other end unsupported, said lead screw being adapted to drive a magnetic read/write head, the unsupported end of said lead screw tending to vibrate in a transverse direction when rotated by said motor due to torsional reaction forces created in moving the head; and
damping assembly means disposed at said unsupported end of said lead screw and including first means carried by said unsupported end and forming a first surface, and resilient means affixed to said frame and forming a second surface, said resilient means being disposed to cause said second surface to engage said first surface with a force directed along the axis of said lead screw, whereby the frictional forces developed between said first and second surfaces due to transverse vibrating motion of said unsupported end tend to resist such motion.

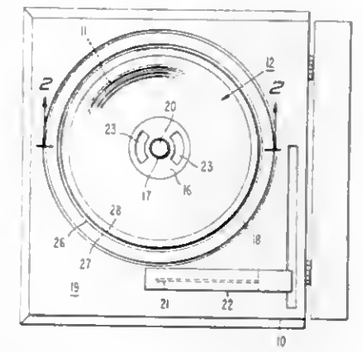
4,030,138

RECORD PROTECTION SYSTEM

James Hillier, Princeton, N.J., assignor to RCA Corporation, New York, N.Y.

Filed July 18, 1975, Ser. No. 597,371
Int. Cl.² G11B *17/04*
U.S. Cl. 360—135 **12 Claims**

1. A record protection system comprising:
1. a record having an outer periphery, a central unrecorded region, and a recorded region disposed between said outer periphery and said central unrecorded region; said central unrecorded region including finger receiving holes for facilitating the manual handling of said record;
2. record receiving means including a wall portion defining the edge of a well for removably receiving said record; and
3. a cover mounted for motion between a closed position and an open position relative to said record receiving means;
the construction of said record protection system being such that said well is exposed to permit manual placement and removal of the record, when said cover is in said open position; and



wherein the spacing between said wall portion and said outer periphery of said record, when in said well, is such that grasping of said outer periphery of said record directly with human fingers is precluded.

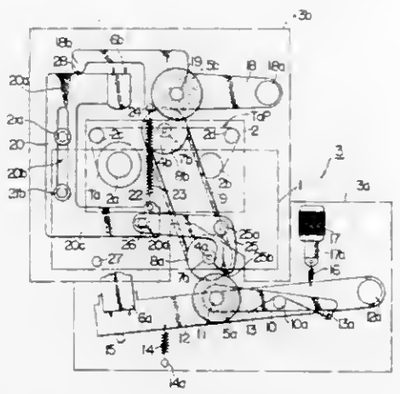
A. first and second capstans;

B. a first pinch roller moveable between a first position wherein said first pinch roller is out of operative engagement with said first capstan and a second position wherein said first pinch roller is in operative engagement with said first capstan;

C. first receiving means for selectively receiving a compact cassette or an adaptor, said first receiving means adapted to position a tape contained in a compact cassette between said first capstan and said first pinch roller when a compact cassette is placed in said first receiving means;

2. said adaptor comprising:

A. a second pinch roller moveable between a third position wherein said second pinch roller is out of operational engagement with said second capstan when said adaptor is placed in said first receiver means and a fourth position wherein said second pinch roller is in operational engagement with said second capstan when said adaptor is placed in said first receiver means;



B. second receiver means for receiving a micro-cassette and for positioning a tape contained in said micro-cassette between said second pinch roller and said second capstan when a micro-cassette is placed in said second receiver means;

C. means coupling said first pinch roller to said second pinch roller when said adaptor is placed in said first receiver means, said coupling means for moving said second pinch roller into said fourth position in response to movement of said first pinch roller towards said second position.

4,030,136

FLEXIBLE DISK PACK ACCESSING APPARATUS AND METHOD

James Taylor Smith, Boulder, Colo., and Frank Eberhard Talke, Morgan Hill, Calif., assignors to International Business Machines Corporation, Armonk, N.Y.

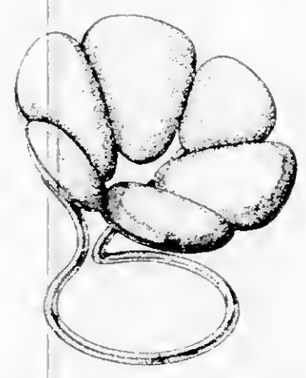
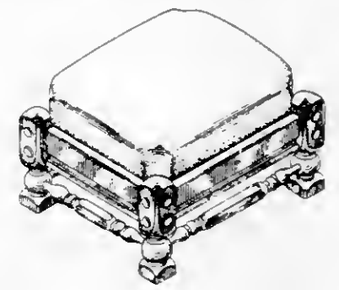
CHAIR
Charles U. Deaton, Genessee Mountain, and Lloyd H. Anderson, 670 McIntyre St., both of Golden, Colo. 80401
Filed Jan. 2, 1976, Ser. No. 646,077
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—26



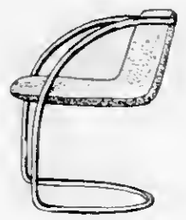
244,644
CONVERTIBLE BENCH
Philip L. Null, Maiden, N.C., assignor to Null Manufacturing Corporation
Filed Jan. 5, 1976, Ser. No. 646,839
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—36



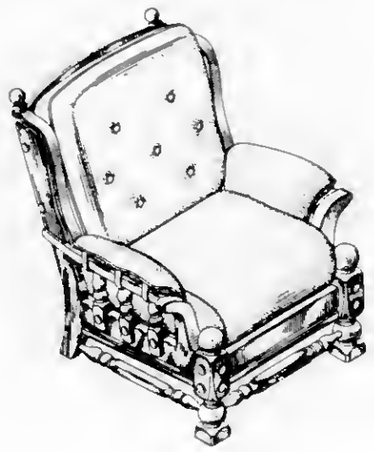
244,645
BLOW MOLDED PLASTIC SEAT
Floyd H. Talmon, Fairview Park, Ohio, and David K. Talmon, Williamsville, N.Y., assignors to Air-Lock Plastics, Inc., Tonawanda, N.Y.
Filed Nov. 28, 1975, Ser. No. 635,957
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—48

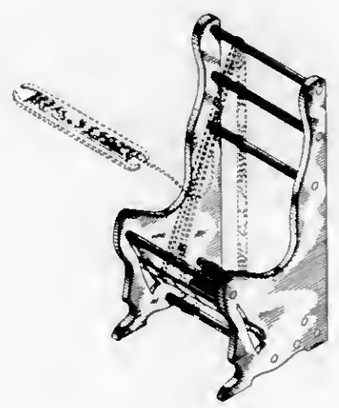
244,646
FOLDABLE ROCKING CHAIR
Suekichi Uchida, Oguchi, Japan, assignor to Uchida Sharyo Co., Ltd., Nagoya, Japan
Filed Nov. 6, 1975, Ser. No. 629,315
The portion of the term of this patent subsequent to Nov. 18, 1989, has been disclaimed.
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—49

244,647
ARMCHAIR
Giovanni Offredi, Milan, Italy, assignor to Fratelli Saporiti Industria Arredamenti Di Saporiti, Sergio E Giorgio S.N.C., Besnate (Varese), Italy
Filed June 8, 1972, Ser. No. 261,138
Claims priority, application Italy, Mar. 15, 1972, 21297/72
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—56

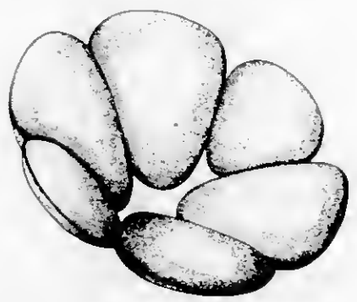


244,648
CONVERTIBLE CHAIR
Jeanne M. Swain, 801 S. 25th St., Allentown, Pa. 18103
Filed Oct. 14, 1975, Ser. No. 622,111
Term of patent 3½ years
Int. Cl. D6—*01*
U.S. Cl. D6—64



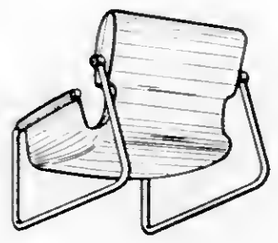


244,649
SEAT
Charles U. Deaton, Genessee Mountain, and Lloyd H. Anderson, 670 McIntyre St., both of Golden, Colo. 80401
Filed Jan. 2, 1976, Ser. No. 646,078
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—66

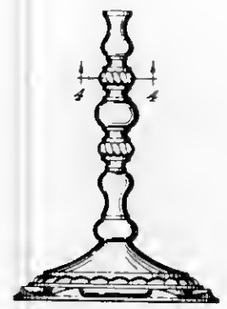


244,650
SEAT
Philip L. Null, Maiden, N.C., assignor to Null Manufacturing Corporation
Filed Jan. 5, 1976, Ser. No. 646,524
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—68

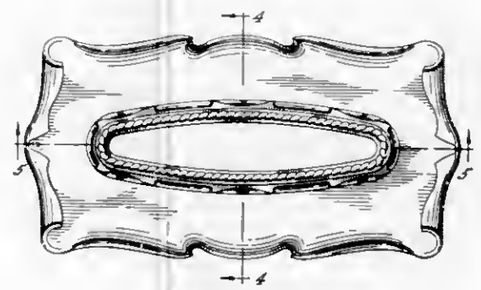
244,651
CHAIR
Maurice Prentice Burke, Apartment 402, 3300 De La Falaise, Montreal, Canada (H3R 2E5)
Filed Aug. 21, 1975, Ser. No. 606,544
Claims priority, application United Kingdom, Feb. 25, 1975, 970002/75
Term of patent 14 years
Int. Cl. D6—*01*
U.S. Cl. D6—69



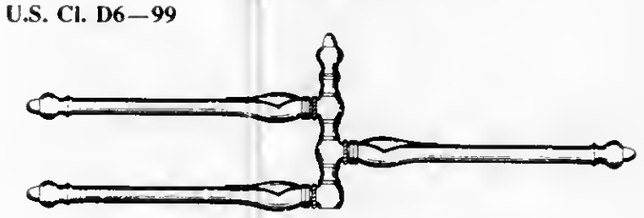
244,652
PEDESTAL FOR BATHROOM FIXTURES OR THE LIKE
Raymond U. H. Tegner, Lodi, Wis., assignor to Amerock Corporation, Rockford, Ill.
Filed Dec. 12, 1975, Ser. No. 640,032
Term of patent 14 years
Int. Cl. D23—*01*; D6—*06*
U.S. Cl. D6—86



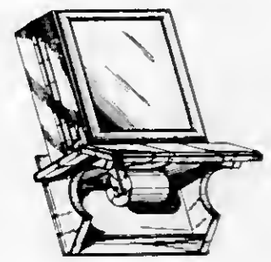
244,653
COVER FOR TISSUE BOXES OR THE LIKE
Raymond U. H. Tegner, Lodi, Wis., assignor to Amerock Corporation, Rockford, Ill.
Filed Dec. 12, 1975, Ser. No. 640,241
Term of patent 14 years
Int. Cl. D23—*02*
U.S. Cl. D6—98



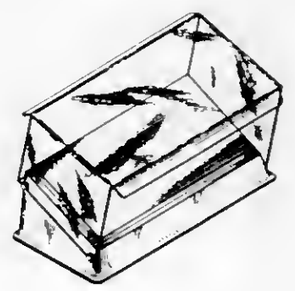
244,654
TOWEL RACK ELEMENT
Raymond U. H. Tegner, Lodi, Wis., assignor to Amerock Corporation, Rockford, Ill.
Filed Dec. 12, 1975, Ser. No. 640,030
Term of patent 14 years
Int. Cl. D23—*02*
U.S. Cl. D6—99



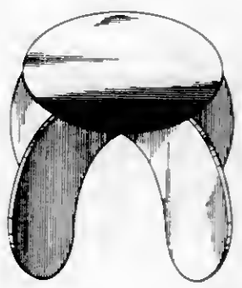
244,655
TELEPHONE BOOK CASE AND DESK COMBINATION
Victor H. Kemp, 1699 Cannes Way, Salt Lake City, Utah 84121
Filed Aug. 11, 1975, Ser. No. 603,461
Term of patent 14 years
Int. Cl. D6—*04*
U.S. Cl. D6—128



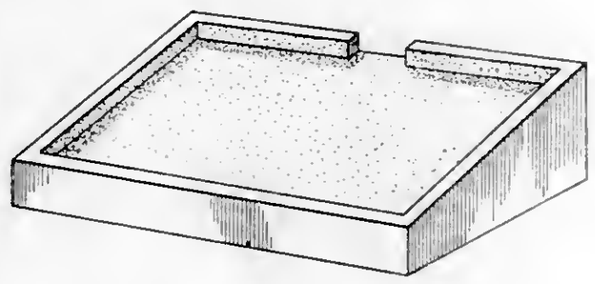
244,656
DISPLAY CASE
Loren J. Lawson, 7358 18th Ave. NW., Seattle, Wash. 98117
Filed May 24, 1976, Ser. No. 689,032
Term of patent 14 years
Int. Cl. D20—*02*
U.S. Cl. D6—173



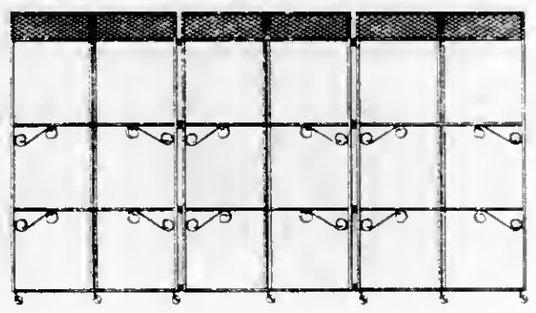
244,657
TABLE
Richard F. Laurenzi, 620 Vanderbilt Ave., Brooklyn, N.Y. 11238
Filed Oct. 15, 1975, Ser. No. 622,706
Term of patent 14 years
Int. Cl. D6—*03*
U.S. Cl. D6—177



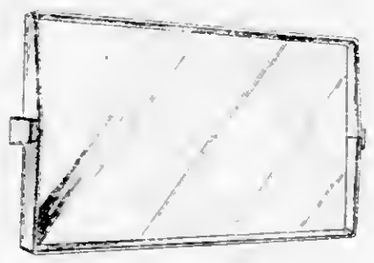
244,658
SUPPORT STAND FOR A PORTABLE CALCULATOR
Jack Allen Turner, R.R. No. 2, Box 111, Centerville, Ind. 47330
Filed Nov. 17, 1975, Ser. No. 632,449
Term of patent 14 years
Int. Cl. D6—*04*
U.S. Cl. D6—181



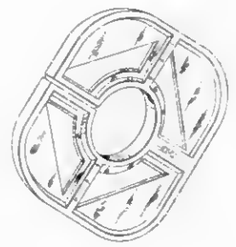
244,659
FOLDABLE SHELF UNIT OR SIMILAR ARTICLE
Allen E. Coles, Oklahoma City, Okla., assignor to W & W Steel Company, Oklahoma City, Okla.
Filed Aug. 20, 1975, Ser. No. 605,980
Term of patent 14 years
Int. Cl. D20—*02*
U.S. Cl. D6—186



244,660
MIRROR
Guy Vrignaud, Grenoble, France, assignor to Allibert Exploitation, Societe Anonyme, Puteaux, France
Filed Aug. 18, 1975, Ser. No. 605,316
Claims priority, application France, Mar. 6, 1975, 75.73678
Term of patent 14 years
Int. Cl.[2] D6—*07*
U.S. Cl. D6—240

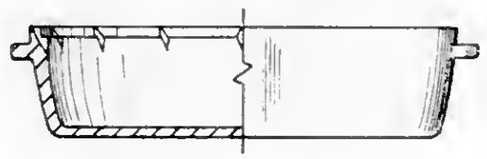


244,661
WARDROBE SYSTEMIZER DEVICE
Franklin H. Henry, 1431 Prentice Drive, Healdsburg, Calif. 95448
Filed Dec. 22, 1975, Ser. No. 642,773
Term of patent 14 years
Int. Cl. D6—*08*
U.S. Cl. D6—257

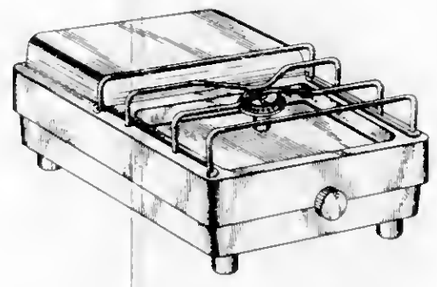


244,662
DINNER PLATE OR SIMILAR ARTICLE
James W. Luce, Syracuse, N.Y., assignor to Syracuse China Corporation, Syracuse, N.Y.
Filed July 21, 1975, Ser. No. 597,460
Term of patent 14 years
Int. Cl. D7—*01*
U.S. Cl. D7—36

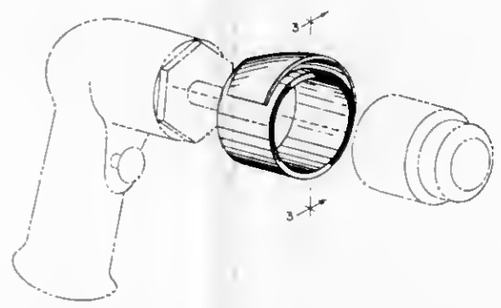
244,663
FRYING PAN
Jin Sul Cho, 1182 Cass St., Monterey, Calif. 93940
Filed Mar. 6, 1975, Ser. No. 556,001
Term of patent 14 years
Int. Cl. D7—*02*
U.S. Cl. D7—97



244,664
GAS STOVE OR SIMILAR ARTICLE
Claude Alain Richard Monnet, Paris, France, assignor to Shell International Petroleum Company Limited, London, England
Filed June 18, 1975, Ser. No. 587,878
Term of patent 14 years
Int. Cl. D7—*04*
U.S. Cl. D7—110



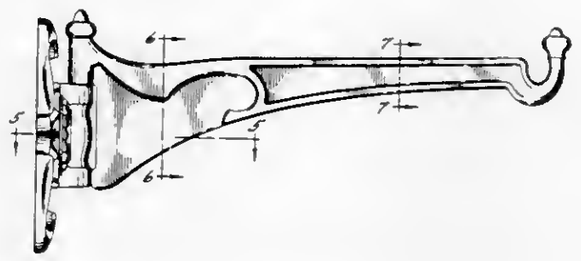
244,665
AIR TOOL HOUSING SHROUD
Richard H. Krom, 1700 Harrington Ave. NE., Renton, Wash. 98055
Filed Dec. 9, 1974, Ser. No. 530,792
Term of patent 14 years
Int. Cl. D8—*05*
U.S. Cl. D8—70



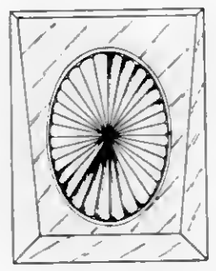
244,666
HACKSAW
Roy G. Kaywood, Stockbridge, Mich., assignor to Kaywood Products Corporation, Jackson, Mich.
Filed Apr. 19, 1976, Ser. No. 677,900
Term of patent 14 years
Int. Cl. D8—*03*
U.S. Cl. D8—96

244,667
HANDCUFF LOCK KEY
Alan W. Craft, 15626 Larch Ave., Lawndale, Calif. 90260
Filed May 7, 1976, Ser. No. 684,197
Term of patent 14 years
Int. Cl. D8—*07*
U.S. Cl. D8—347

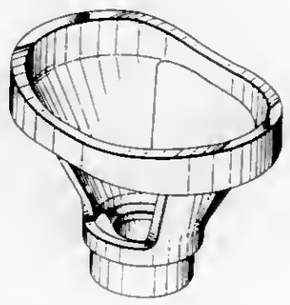
244,668
COMBINED BRACKET AND SUPPORTING ARM
Raymond U. H. Tegner, Lodi, Wis., assignor to Amerock Corporation, Rockford, Ill.
Filed Dec. 12, 1975, Ser. No. 639,810
Term of patent 14 years
Int. Cl. D8—*08*
U.S. Cl. D8—363



244,669
JEWELRY BOX
Jerome Shiffman, 128 Carthage Road, Scarsdale, N.Y. 10583
Filed Aug. 31, 1973, Ser. No. 393,443
Term of patent 7 years
Int. Cl. D9—*03*
U.S. Cl. D9—235



244,670
DISPENSING CAP FOR AN EYE DROP BOTTLE OR THE LIKE
Stuart F. Winikoff, 9195 Collington Square, Allison Park, Pa. 15101
Filed Jan. 30, 1975, Ser. No. 545,475
Term of patent 14 years
Int. Cl.[2] D9—*07*
U.S. Cl. D9—261

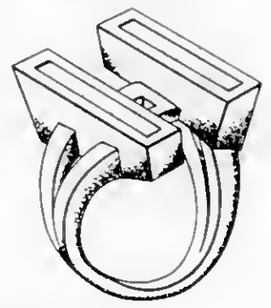


244,671
DIGITAL WRISTWATCH
Humbert C. Cozza, 16922 Club Hill Drive, Dallas, Tex. 75248
Filed Feb. 17, 1976, Ser. No. 658,636
Term of patent 14 years
Int. Cl.[2] D10—*02*
U.S. Cl. D10—38

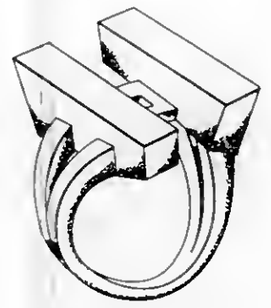
244,672
MOON DISC FOR A CLOCK FACE
Jane K. Molyneux, Carmel; Albert J. Day; Regina M. Day, both of San Mateo, all of Calif., and Theo E. Kaiser, Schwenningen, Germany, assignors to Molyneux Clocks, Burlingame, Calif.
Filed Mar. 15, 1976, Ser. No. 667,196
Term of patent 14 years
Int. Cl.[2] D10—*07*
U.S. Cl. D10—126

244,673
JEWELRY CLASP MEMBER
Paul V. Little, Central Islip, N.Y., assignor to Dover Findings, Inc., Deer Park, N.Y.
Filed Oct. 23, 1975, Ser. No. 624,739
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—87

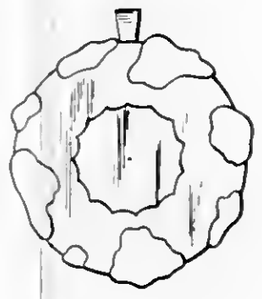
244,674
RING WITH CANTED TOP BARS
Sidney Frederick Mobell, 330 Bridge Road, Hillsborough, Calif. 94010
Filed Apr. 7, 1975, Ser. No. 565,976
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—34



244,675
RING WITH CANTED TOP BARS
Sidney Frederick Mobell, 330 Bridge Road, Hillsborough, Calif. 94010
Filed Apr. 7, 1975, Ser. No. 565,977
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—35

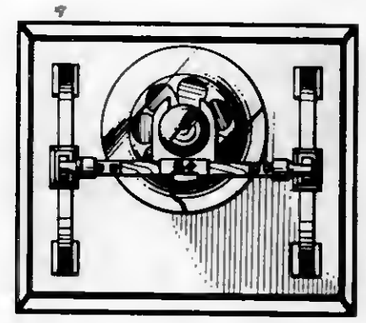


244,676
PENDANT
Gary K. Kobashikawa, 3460 Maluhia St., Honolulu, Hawaii 96816
Division of Ser. No. 598,213, July 23, 1975, Pat. No. Des. 243,360. This application Sept. 14, 1976, Ser. No. 733,211
Term of patent 14 years
Int. Cl. D11—*01*
U.S. Cl. D11—44



244,677
PLACARD OR SIMILAR ARTICLE
Alphonse L. Micely, 33651 3rd St., Union City, Calif. 94587
Filed Oct. 8, 1975, Ser. No. 620,704
Term of patent 14 years
Int. Cl. D11—*02*
U.S. Cl. D11—134

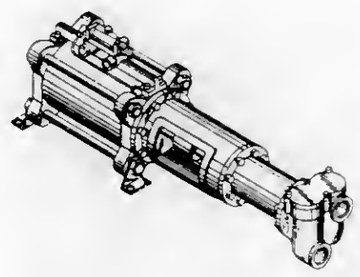
244,678
COMBINED BELL AND STAND THEREFOR
John W. Weimer, 709 Beechurst Ave., Morgantown, W. Va. 26505
Filed Apr. 10, 1975, Ser. No. 567,018
Term of patent 7 years
Int. Cl. D11—*02*
U.S. Cl. D11—157



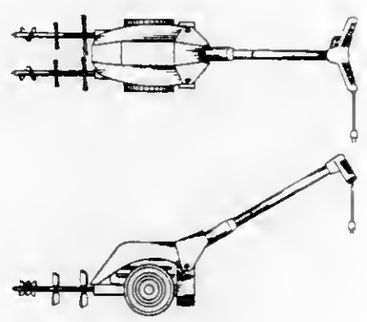
244,679
MASTHEAD FLAGSTAFF
Robert D. Outerbridge, 2059 Huntington Ave., Alexandria, Va. 22303
Filed Nov. 3, 1975, Ser. No. 628,064
Term of patent 14 years
Int. Cl. D11—*05*
U.S. Cl. D11—181

244,680
PADDLE
Darrell J. Leidigh, 224 Robin Road, Altamonte Springs, Fla. 32701, and R. Mark Leidigh, 8 Willow Place, Brooklyn, N.Y. 11201
Filed Jan. 19, 1976, Ser. No. 650,562
Term of patent 14 years
Int. Cl. D12—*06*
U.S. Cl. D12—215

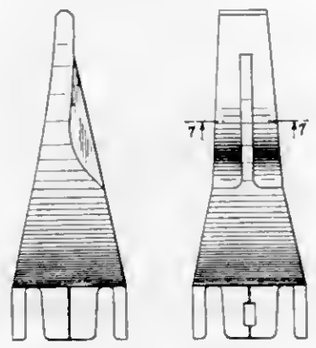
244,681
FLUID PUMP OR SIMILAR ARTICLE
Robert R. Bell, Houston, Tex., assignor to Vapor Corporation, Chicago, Ill.
Filed Aug. 14, 1975, Ser. No. 604,597
Term of patent 3½ years
Int. Cl. D15—*02*
U.S. Cl. D15—7



244,682
GARDEN TILLER
Earl L. Miner, Long Lane, Mo., assignor to Detroit Tool & Engineering Co., Lebanon, Mo.
Filed Mar. 5, 1976, Ser. No. 664,319
Term of patent 14 years
Int. Cl. D15—*03*
U.S. Cl. D15—12

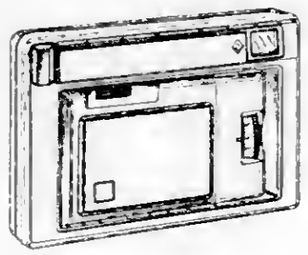


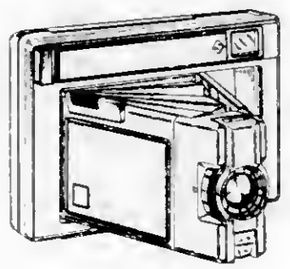
244,683
TOOTH FOR DREDGE CUTTER HEAD OR THE LIKE
Stephen M. Bowes, Jr., Jacksonville, Fla., assignor to Florida Machine & Foundry Co., Jacksonville, Fla.
Filed Jan. 26, 1976, Ser. No. 652,213
Term of patent 14 years
Int. Cl. D15—*04*
U.S. Cl. D15—29



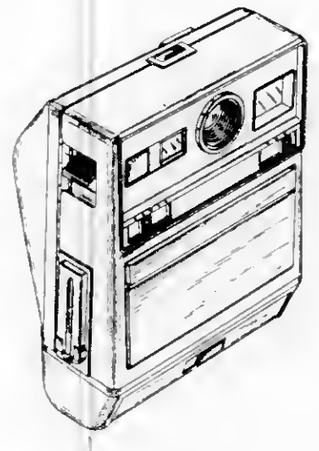
244,684
REFRIGERATOR
Robert D. Bartlett, Shawnee, Kans.; Myron G. Kordes, Parkville, Mo., and Paul H. Morphy, Prairie Village, Kans., assignors to Hobart Corporation, Troy, Ohio
Filed Aug. 4, 1976, Ser. No. 711,592
Term of patent 14 years
Int. Cl. D15—*07*
U.S. Cl. D15—81

244,685
PHOTOGRAPHIC CAMERA OR SIMILAR ARTICLE
David E. Hansen, Fairport, N.Y., and Wolfgang Ort, Stuttgart, Germany, assignors to Eastman Kodak Company, Rochester, N.Y.
Filed Mar. 22, 1976, Ser. No. 669,437
Term of patent 14 years
Int. Cl. D16—*01*
U.S. Cl. D16—5

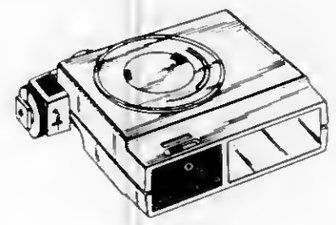




244,686
PHOTOGRAPHIC CAMERA OR SIMILAR ARTICLE
David E. Hansen, Fairport, N.Y., assignor to Eastman Kodak Company, Rochester, N.Y.
Filed Jan. 19, 1976, Ser. No. 650,477
Term of patent 14 years
Int. Cl. D16—*01*
U.S. Cl. D16—06



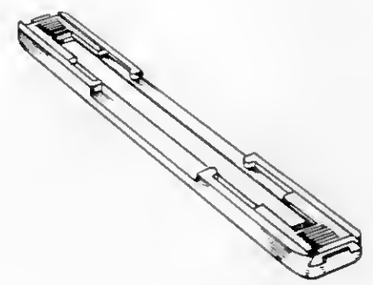
244,687
FLASH UNIT FOR A PHOTOGRAPHIC CAMERA
Naoya Tsugami, Tokyo, Japan, assignor to Asahi Kogaku Kogyo Kabushiki Kaisha, Tokyo, Japan
Filed June 9, 1975, Ser. No. 584,947
Term of patent 14 years
Int. Cl. D16—*05*
U.S. Cl. D16—42



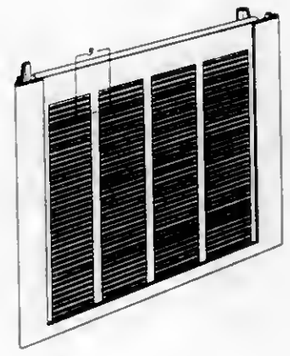
244,688
OPHTHALMIC SPECTACLES
Antoine Bourgeois, 39400 Morbier (Jura), France
Filed July 2, 1975, Ser. No. 592,637
Term of patent 14 years
Int. Cl. D16—*06*
U.S. Cl. D16—65

244,689
OPHTHALMIC SPECTACLES
Antoine Bourgeois, 39400 Morbier (Jura), France
Filed July 2, 1975, Ser. No. 592,638
Term of patent 14 years
Int. Cl. D16—*06*
U.S. Cl. D16—65

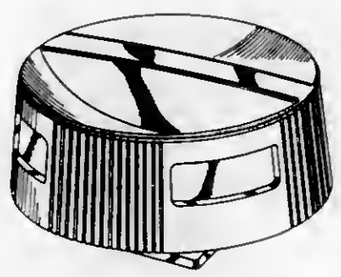
244,690
FILE FASTENER COMPRESSOR BAR
Menahem Hirsh, 15 Pontrialto, Fife Avenue, Berea, Johannesburg, Transvaal, South Africa
Filed Oct. 9, 1975, Ser. No. 621,040
Term of patent 14 years
Int. Cl. D19—*02*
U.S. Cl. D19—65



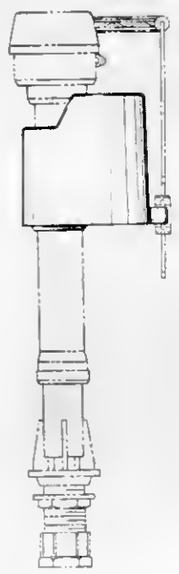
244,691
COMBINED FILTER AND PANEL FOR EVAPORATIVE AIR-CONDITIONER
Terrence Keith Morrison, and Brian Eric McLaren, both of P.O. Box 156, Buronga, New South Wales, 2648, Australia
Filed Mar. 27, 1975, Ser. No. 562,669
Claims priority, application Australia, Sept. 27, 1974, 65783/74
Term of patent 14 years
Int. Cl. D23—*04*
U.S. Cl. D23—149



244,692
AIR FRESHENER OR SIMILAR ARTICLE
Georg Schimanski, Hagen, Germany, assignor to Globol-Werk GmbH, Neuburg, Germany
Filed May 17, 1976, Ser. No. 687,124
Claims priority, application Germany, Feb. 17, 1976, 297
Term of patent 14 years
Int. Cl.[2] D23—99
U.S. Cl. D23—150

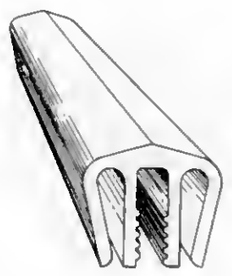


244,693
BALL COCK FLOAT
Adolf Schoepe, 1620 N. Raymond Ave., Fullerton, Calif. 92631
Filed July 19, 1976, Ser. No. 706,400
Term nf patent 14 years
Int. Cl. D23—*01*
U.S. Cl. D23—33

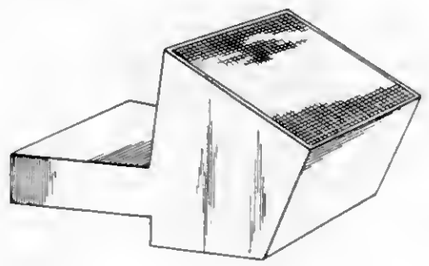


244,694
EQUIPMENT SHELTER AND THE LIKE
James B. McClure, 7810 NW. Scenic Drive, Kansas City, Mo. 64152
Filed Jan. 21, 1976, Ser. No. 646,358
Term of patent 14 years
Int. Cl. D25—*03*
U.S. Cl. D25—33

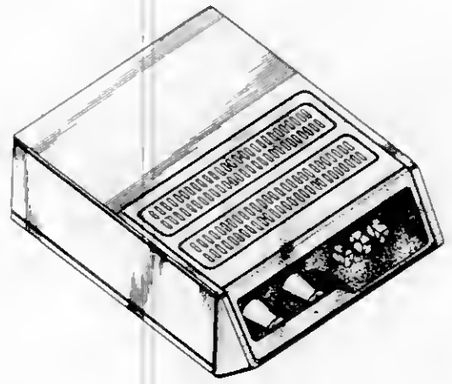
244,695
JOINT ELEMENT
Stig Martin Lindblad, 20 rue Saint-Pierre, CH 1701 Fribourg, Switzerland
Filed Sept. 12, 1975, Ser. No. 612,948
Claims priority, application Sweden, Mar. 19, 1975, 7500058
Term of patent 14 years
Int. Cl.[2] D25—*01*
U.S. Cl. D25—75



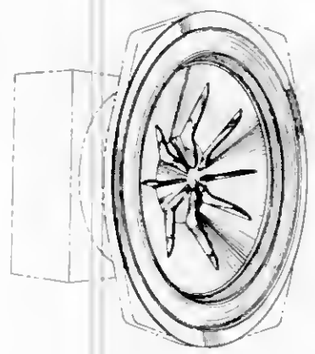
244,696
SPEAKER ENCLOSURE
Warren Ripple, 2839 Sterling Lane, Sarasota, Fla. 33581
Filed Feb. 14, 1975, Ser. No. 550,089
Term of patent 14 years
Int. Cl. D14—*01*
U.S. Cl. D14—30



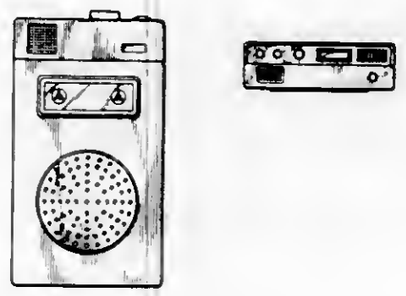
244,697
MOBILE TWO-WAY RADIO APPARATUS OR SIMILAR ARTICLE
Masaru Tokiyama, Bloomingdale, Ill., assignor to Motorola, Inc., Schaumburg, Ill.
Filed July 14, 1975, Ser. No. 595,961
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—68



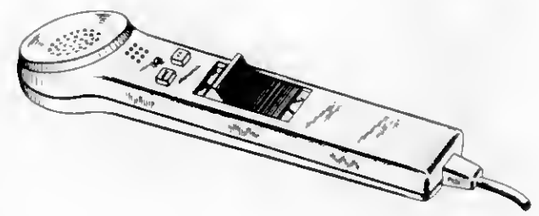
244,698
LOUDSPEAKER CONE
Burton A. Babb, Dallas, Tex., assignor to Babbco, Ltd., Dallas, Tex.
Filed Mar. 3, 1976, Ser. No. 663,341
Term of patent 14 years
Int. Cl. D14—*01*
U.S. Cl. D14—37



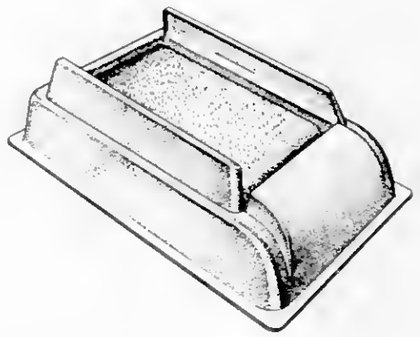
244,699
TAPE RECORDER
Shinobu Okamoto, Oyama, Japan, assignor to Kowa Company Ltd., Tokyo, Japan
Filed May 20, 1976, Ser. No. 688,369
Term of patent 14 years
Int. Cl. D14—*01*
U.S. Cl. D14—6



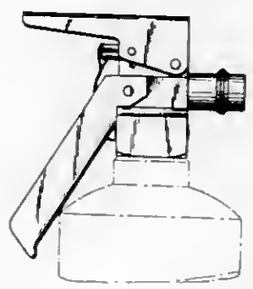
244,700
REMOTE CONTROL MICROPHONE OR SIMILAR ARTICLE
Arthur J. Pulos, Fayetteville; Michael Cridland, Manlius, and Joseph Moro, Ithaca, all of N.Y., assignors to Dictaphone Corporation, Rye, N.Y.
Filed June 28, 1976, Ser. No. 700,146
Term of patent 14 years
Int. Cl. D14—*01*
U.S. Cl. D14—12



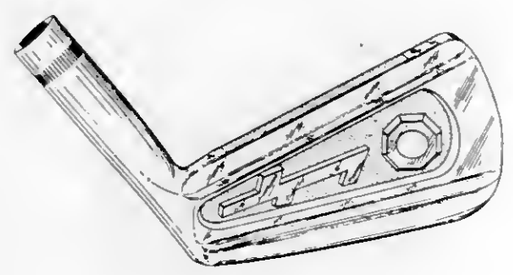
244,701
ANIMAL TOILET
Wayne L. Knochel, and Robert S. Traeger, both of Rochester, Ind., assignors to KLT Industries, Inc., Rochester, Ind.
Filed May 24, 1976, Ser. No. 688,980
Term of patent 14 years
Int. Cl. D30—*99*
U.S. Cl. D30—99



244,702
ACTUATOR ASSEMBLY FOR A PORTABLE HAND FIRE EXTINGUISHER
Roger Jay Montambo, Red Wing, Minn., assignor to The Ansul Company, Marinette, Wis.
Filed June 2, 1975, Ser. No. 582,919
Term of patent 14 years
Int. Cl. D29—*01*
U.S. Cl. D29—2



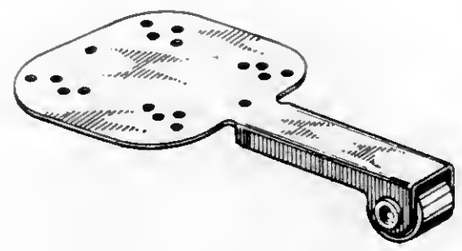
244,703
GOLF IRON HEAD
Timothy L. Guzzle, 3805 Trails Edge, Fort Worth, Tex. 76109, and Eugene L. Sheeley, 2428 Hillview Drive, Fort Worth, Tex. 76119
Filed Aug. 6, 1975, Ser. No. 602,268
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 GH



244,704
COMBINED SLIDE AND SWING SUPPORT OR THE LIKE
Emmanuel S. Smyrni, and Bobbie L. White, both of Shreveport, La., assignors to Gym-Dandy, Inc., Bossier City, La.
Filed Sept. 8, 1975, Ser. No. 611,039
Term of patent 14 years
Int. Cl. D21—*03*
U.S. Cl. D34—5 M

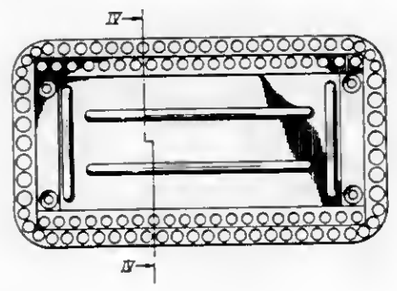
244,705
GOLF BAG
Donald G. Beste, 4725 Idlewood Court, Peoria, Ill. 61614
Filed Oct. 3, 1975, Ser. No. 619,519
Term of patent 14 years
Int. Cl. D21—*02*
U.S. Cl. D34—5 GB

244,706
AUXILIARY WHEEL FOR A SKATEBOARD
Hector H. Vela, 11903 Everle, Cerritos, Calif. 90701
Filed Feb. 5, 1976, Ser. No. 655,469
Term of patent 14 years
Int. Cl. D21—*01*
U.S. Cl. D34—15 AJ

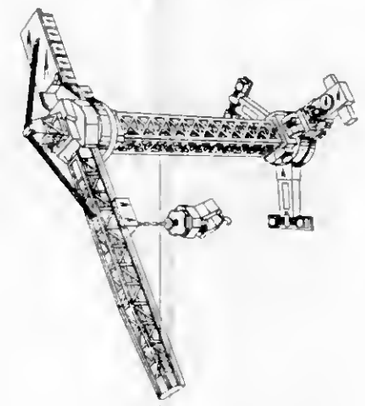


244,707
TOY DIGITAL WATCH
Darin M. Tiep, North Hollywood, Calif., assignor to Carrousel Party Favors, Inc., North Hollywood, Calif.
Filed Mar. 1, 1976, Ser. No. 662,423
Term of patent 7 years
Int. Cl. D21—*01*
U.S. Cl. D34—15 R

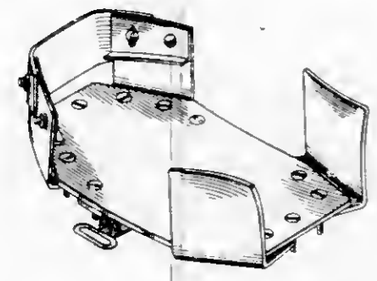
244,708
SWING SEAT
Victor Horace Yates, Shelley, near Huddersfield, England, assignor to The Sutcliffe Engineering Holdings Limited, Ossett, England
Filed Sept. 5, 1975, Ser. No. 610,767
Claims priority, application United Kingdom, Mar. 12, 1975, 970282/75
Term of patent 14 years
Int. Cl. D21—*03*
U.S. Cl. D34—5 M



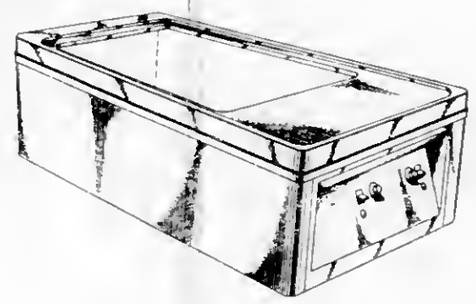
244,709
TOY CRANE
Hiroshi Sano, No. 7-9-10 Tateisbi, Katsushika, Tokyo, Japan
Filed July 16, 1975, Ser. No. 596,168
Term of patent 14 years
Int. Cl. D21—*01*
U.S. Cl. D34—15 S



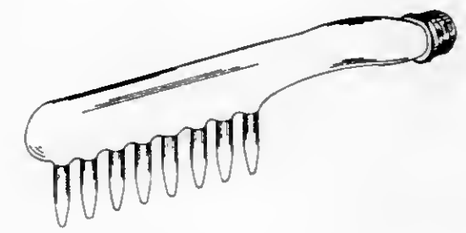
244,710
SNOWSHOE BINDING
Fritz Maul, 3768 S. 189th Place, Seattle, Wash. 98188
Filed Apr. 12, 1976, Ser. No. 657,778
Term of patent 14 years
Int. Cl. D02—*04*
U.S. Cl. D34—14 D



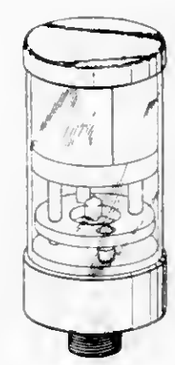
244,711
CABINET FOR A WATER BATH SHAKER
John T. Armbruster, Niagara Falls, N.Y., assignor to American Optical Corporation, Southbridge, Mass.
Filed Feb. 6, 1976, Ser. No. 655,649
Term of patent 14 years
Int. Cl. D24—*02*
U.S. Cl. D24—38



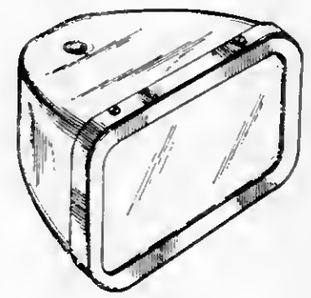
244,712
DOG GROOMING COMB
Rosa B. Houston, R.R. No. 2 (Box 126), Vance, Miss. 38964
Filed Dec. 29, 1975, Ser. No. 644,039
Term of patent 14 years
Int. Cl. D30—*99*
U.S. Cl. D30—40



244,713
MARINE LAMP
Desmond Egan-Andrew, High Street, Chobham, Woking, Surrey, England
Filed May 12, 1975, Ser. No. 576,793
Term of patent 14 years
Int. Cl. D26—*05*
U.S. Cl. D48—20 E

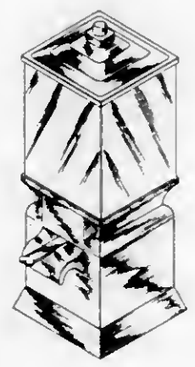


244,714
HEADLAMP HOUSING
Charles R. Ross, Laurel, Md., assignor to C.R. Engineering, Inc., College Park, Md.
Filed Feb. 2, 1976, Ser. No. 654,266
Term of patent 14 years
Int. Cl. D26—*06*
U.S. Cl. D48—32 R

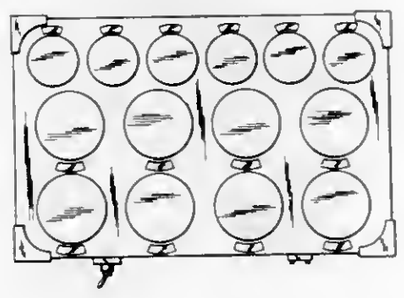


244,715
AUTOMOBILE ACCESSORY LAMP
John F. Fierro, 4115 Meadow Lane, Seaford, N.Y. 11783, and George A. Dunning, 280 N. Poplar St., N. Massapequa, N.Y. 11758
Filed Dec. 11, 1975, Ser. No. 639,720
Term of patent 14 years
Int. Cl. D26—*05, 06*
U.S. Cl. D48—20 E

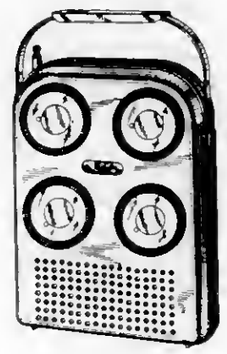
244,716
DISPENSER
Lane T. Weltzman, 4647 Park Mirasol, Calabasas, Calif. 91302
Filed Aug. 13, 1975, Ser. No. 604,108
Term of patent 14 years
Int. Cl. D20—*01*
U.S. Cl. D52—3 R



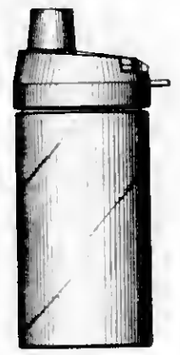
244,717
ELECTRONIC PERCUSSION MUSICAL INSTRUMENT
Florian Schneider, Leo Statzstr. 27, 4 Dusseldorf, and Ralf Hutter, Tiergardenstr. 45, 415 Krefeld, both of Germany
Filed July 10, 1975, Ser. No. 594,705
Term of patent 14 years
Int. Cl. D17—*04, 05*
U.S. Cl. D56—1 E



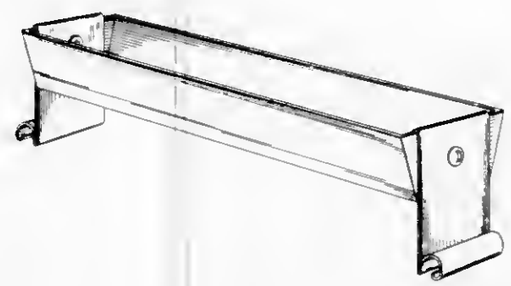
244,718
RADIO
Ronald Emmerling, New City, N.Y., assignor to Panorama Radio & Electronics Corporation, New York, N.Y.
Filed July 8, 1975, Ser. No. 594,401
Term of patent 14 years
Int. Cl. D14—*03*
U.S. Cl. D14—70



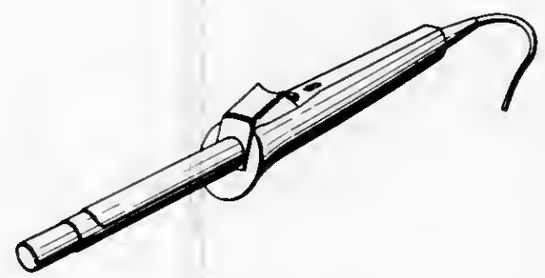
244,719
COMBINED VACUUM CURETTAGE VESSEL AND VALVE CLOSURE THEREFOR
Michael D. Thomas, Elmhurst, and Francis E. Ryder, Barrington, both of Ill., assignors to Ryder International Corporation, Schaumburg, Ill.
Filed Dec. 11, 1975, Ser. No. 639,648
Term of patent 14 years
Int. Cl. D24—*04*
U.S. Cl. D24—28



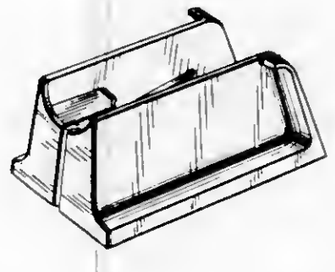
244,720
SNAP-ON HAIR STYLIST'S TRAY
Frederic V. Winkler, 14713 Waterway Drive, Rockville, Md. 20854
Filed Feb. 27, 1974, Ser. No. 446,482
Term of patent 14 years
Int. Cl. D28—*03*
U.S. Cl. D28—73



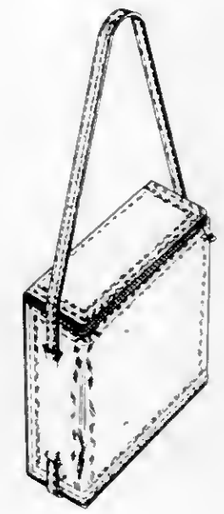
244,721
CURLING IRON
Ingeborg Kohl, Langenfeld, Germany, assignor to Reckjunior Cosmetic GmbH & Co. KG, Langenfeld, Germany
Filed Sept. 10, 1975, Ser. No. 612,040
Term of patent 14 years
Int. Cl. D28—*03*
U.S. Cl. D28—35



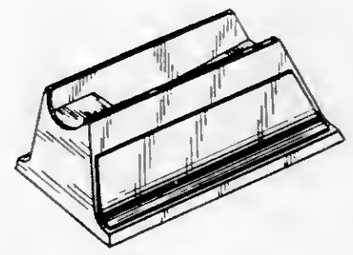
244,722
STAND FOR A CURLER/STYLER
Bernard B. Bluestein, Des Plaines, Ill., assignor to Sunbeam Corporation, Chicago, Ill.
Filed Dec. 12, 1975, Ser. No. 640,335
Term of patent 14 years
Int. Cl. D28—*03*
U.S. Cl. D28—38



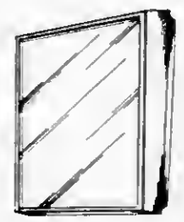
244,723
INSULATED TOTE BAG
Harold Rabinowitz, Lakewood, N.J., assignor to Dart Industries Inc., Los Angeles, Calif.
Filed July 31, 1975, Ser. No. 600,700
Term of patent 14 years
Int. Cl. D3—*01*
U.S. Cl. D87—1 R



244,724
STAND FOR CURLER/STYLER
Bernard B. Bluestein, Des Plaines, Ill., assignor to Sunbeam Corporation, Chicago, Ill.
Filed Dec. 12, 1975, Ser. No. 640,261
Term of patent 14 years
Int. Cl. D28—*03*
U.S. Cl. D28—38



244,725
ILLUMINATED SIGN
Donald H. Niehaus, Crestview Hills, Ky.; Nick J. Schwab, Cincinnati, Ohio, and Patrick J. Seggerson, Fort Mitchell, Ky., assignors to American Sign and Advertising Services, Inc., Florence, Ky.
Filed Apr. 7, 1976, Ser. No. 674,610
Term of patent 14 years
Int. Cl. D20—*03*
U.S. Cl. D96—12 R



LIST OF PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 14TH DAY OF JUNE, 1977

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

A-B-C Packaging Machine Corporation: *See—*
Reichert, Donald G., 4,029,001.

A. Johnson & Co. Inc.: *See—*
Knopp, Walter V., 4,029,476.

A. O. Smith Corporation: *See—*
Farnia, Ken, 4,029,451.

A P Products Incorporated: *See—*
Schmidt, Gary M.; Gabor, Robert J.; and Venaleck, John T., 4,029,914.
Webster, John L., 4,029,917.

A-T-O Inc.: *See—*
Goodsell, Earl M., Jr., 4,029,150.

AB Bofors: *See—*
Bjornson, Bjorn Ove, 4,029,018.

AB S.T. Miljoteknik: *See—*
Siwersson, Olle Lennart; and Tell, Karl Gunnar, 4,029,485.

AB Wicanders Korkfabriker: *See—*
Jonsson, Knut Johan Vilhelm, 4,029,231.

Abbott, John R., to Goodyear Tire & Rubber Company, The. Tire and rim assemhly. 4,029,139, Cl. 152-379.100.

Abbott Laboratories: *See—*
Stein, Herman Hal; and Prasad, Raj Nandan, 4,029,884.
Winn, Martin, 4,029,665.

Abel, Edward P., to Eastman Kodak Company. Cover sheets with timing layer comprising cellulose acetate and copolymer of maleic anhydride. 4,029,849, Cl. 428-500.000.

Abex Corporation: *See—*
Adams, Cecil E., 4,029,439.

Abraham, Michel, to Compagnie Industrielle des Telecommunications Cit-Alcatel. Apparatus for detecting the rhythm of an NRZ message. 4,029,905, Cl. 178-88.000.

Acher, Jacques: *See—*
Bulteau, Gerard; Acher, Jacques; and Monier, Jean-Claude, 4,029,673.

Adachi, Masami: *See—*
Yano, Eizi; Ohkawa, Shunjiro; Komatsu, Tadaaki; and Adachi, Masami, 4,029,222.

Adams, Cecil E., to Abex Corporation. Control system for variable displacement pumps. 4,029,439, Cl. 417-216.000.

Adams, Clifton G.; Dallas, Carl B.; and Coltrin, George E., to Georgia-Pacific Corporation. Method and apparatus for moving a stack of corrugated sheets from a stacker to a desired locus. 4,029,216, Cl. 214-1.0BB.

Adams, Herbert J. F.; and Takman, Bertil H., to Astra Pharmaceutical Products, Inc. Synergistic local anesthetic compositions. 4,029,793, Cl. 424-251.000.

Adams, Herbert J. F.; and Takman, Bertil H., to Astra Pharmaceutical Products, Inc. Pharmaceutical local anesthetic composition. 4,029,794, Cl. 424-253.000.

Adams, John W. Pocket watch display kit. 4,028,842, Cl. 46-1.00R.

Adamski, Donald F.; and Anderson, David M., to MB Associates. Bus loader. 4,029,223, Cl. 214-77.00R.

Adamski, Henry Stanislaus: *See—*
Kindig, Guilford Edwin; and Adamski, Henry Stanislaus, 4,029,184.

Addeo, Eric John, to Bell Telephone Laboratories, Incorporated. Digital synchronizing signal recovery circuits for a data receiver. 4,029,900, Cl. 178-69.100.

Addressograph Multigraph Corporation: *See—*
Mabrouk, Saied Abd-Elrahman, 4,029,008.
Rubenstein, Robert Aron, 4,029,414.
Trenkamp, Robert H., 4,029,944.

Adey, Anthony John: *See—*
Jones, Christopher Robin; Williams, Malcolm; and Adey, Anthony John, 4,029,068.

Aetna-Standard Engineering Company: *See—*
Scheib, William R.; and Schuetz, James W., 4,028,923.

Agence Nationale de Valorisation de la Recherche (ANVAR): *See—*
De Roeck born Holtzhauer, Yannick; and De Roeck, Herve, 4,029,760.
Martinez, Jacques, 4,029,227.

Agency of Industrial Science & Technology: *See—*
Mitsui, Shigeo; Araki, Tomiyasu; Niikawa, Kazuhiko; Hosoda, Hideo; Jyo, Yoshio; Yoda, Ryuichiro; Suzuki, Giichi; Iijima, Takasi; Tanaka, Hiroshi; Ochiai, Yasutaka; and Ise, Takashi, 4,029,550.

AGFA-Gevaert, A.G.: *See—*
Bestenreiner, Friedrich; Helburger, Josef; and Ruf, Wolfgang, 4,030,106.
Wehner, Hans; and Kliemann, Manfred, 4,029,507.

Ahl, Bernard. Apparatus for the construction of ceiling in multi-story concrete buildings. 4,029,286, Cl. 249-19.000.

Ahrens, Norbert; Klockenbusch, Heinrich; Ritzmann, Horst; Klein, Hans; Balzau, Gerhard; and Schnuckel, Clemens, to Polysius AG. Method for feeding powdered material. 4,029,365, Cl. 302-35.000.

Ahrweiler, Karl-Heinz, to Eduard Kusters Maschinenfabrik. Rapid load-relieve device for continuous press. 4,029,456, Cl. 425-149.000.

Aircraft Systems Corporation: *See—*
Juhasz, Charles, 4,029,042.

Akamatsu, Masahiko, to Mitsubishi Denki Kabushiki Kaisha. Inverter. 4,030,021, Cl. 321-45.00C.

Akamine, Takenori: *See—*
Yamada, Kiichiro; Kozu, Isao; Akamine, Takenori; and Shimizu, Ryota, 4,030,133.

A.B. Hammars Mekaniska Verkstad: *See—*
Ekholm, Rolf, 4,029,196.

Aktiebolaget Leo: *See—*
Fex, Hans Jacob; Hogberg, Knut Bertil; and Konyves, Imre, 4,029,778.

A.G. fur industrielle Elektronik AGIE Losone b. Locarno: *See—*
Ullmann, Werner; and Hermann, Ferdy E., 4,029,928.

Aktiengesellschaft Fur Rationelle Verpackung: *See—*
Fickler, Hans; and Frankhauser, Walter, 4,029,208.

Akzona: *See—*
McNeely, Gerald W., 4,029,638.

Akzona Incorporated: *See—*
Sikkema, Doetze J., 4,029,637.

Albaret S.A.: *See—*
Paramythioti, Michel, 4,028,946.

Albatex A.G.: *See—*
Genini, Graziano, 4,029,130.

Albinger, Walter, to U.S. Philips Corporation. Electro-acoustic transducer and method of manufacturing such a transducer. 4,029,911, Cl. 179-115.5ES.

Albrecht, Hermann Friedrich, to Rollei-Werke Franke & Heidecke. Fading mechanism for slide projectors with automatic focusing means. 4,029,407, Cl. 353-86.000.

Alexandrovich, George, Sr.; and Perper, Edward. Degausser. 4,030,002, Cl. 361-151.000.

Ali Zaidi, Syed Mujahid: *See—*
Sharp, Herbert John; Drucker, Rudolf; Droar, Edward; and Ali Zaidi, Syed Mujahid, 4,029,728.

Alig, Leo; Nickolson, Robert; Wiechert, Rudolf; Furst, Andor; Kieslich, Klaus; Muller, Marcel; and Kerb, Ulrich. Steroid carboxylic acids and derivatives. 4,029,692, Cl. 260-468.500.

Allan, John H.; Ball, Jerrold L.; Dull, Charles B.; Gabriel, Leo A.; Curtis, Richard E.; and Dervin, Victor J., to James Allan & Sons, Inc.; and NPI Corporation, part interest to each. Method of and apparatus for carcass cooling. 4,028,774, Cl. 17-24.000.

Allen, Clifford Edwin, to Isca Electronics Limited. Weighing apparatus. 4,029,163, Cl. 177-255.000.

Allen Group Inc., The: *See—*
Wiltrout, Dale E., 4,029,114.

Allen, James Austin, to RCA Corporation. Video disc playback system and pickup cartridge therefor. 4,030,124, Cl. 358-128.000.

Allen, James Austin: *See—*
Taylor, Byron Kent; and Allen, James Austin, 4,030,123.

Allender, David G. Method of and apparatus for detecting conductive particles in an oil flow system. 4,030,028, Cl. 324-65.00R.

Allergan Pharmaceuticals: *See—*
Blanco, Milagros V.; and Maurer, David L., 4,029,817.

Alley, Robert Philbrick; and Klett, Keith Karl, to General Electric Company. Two level inverter circuit. 4,029,993, Cl. 315-219.000.

Allied Chemical Corporation: *See—*
Bollen, Philip Stuart; and Walacavage, Eugene Vincent, 4,029,631.

Allington, Robert W.: *See—*
Lohr, Wilhelm; Berthold, Fritz; and Allington, Robert W., 4,029,961.

Allis-Chalmers Corporation: *See—*
Shaver, J. Lyle, 4,029,228.

Allis, Robert F.: *See—*
Spinelli, Richard A.; and Allis, Robert F., 4,029,409.

Allison Acoustics, Inc.: *See—*
Allison, Roy F., 4,029,910.

Allison, Roy F., to Allison Acoustics, Inc. Wide dispersion loudspeaker with flexing diaphragm. 4,029,910, Cl. 179-115.5ME.

Allison, William D., to Ford Motor Company. Preloaded tie rod end assembly. 4,028,784, Cl. 29-149.50B.

Alos AG: *See—*
Leibundgut, Max; and Reber, Tony, 4,029,956.

Aluminum Company of America: *See—*
Harris, John L.; and Nelson, Bror H., 4,028,862.
Lowe, Richard L., 4,029,363.

Schoener, Ronald C.; King, Larry K.; Knapp, Lester L.; and Kloap, Nicholas, 4,029,750.

Alvarez, Robert E.; and Macovski, Albert, to Leland Stanford Junior University, The Board of Trustees of. X-ray spectral decomposition imaging system. 4,029,963, Cl. 250-360.000.

Amen, Ronald J.: *See—*
Beigler, Myron A.; and Amen, Ronald J., 4,029,773.

American Cyanamid Company: *See—*
Burkhard, Herbert; Hsu, Nelson Nae-Ching; and Fetter, Edward Joseph, 4,029,624.
Cross, Barrington; and Walworth, Bryant Leonidas, 4,029,492.
Fabio, Paul Frank; Lin, Yang-I; Lang, Stanley Albert, Jr.; and Tomcufcik, Andrew Stephen, 4,029,788.
Lies, Thomas Andrew; and Berenson, Herman, 4,029,652.
Schmitt, Joseph Lawrence, Jr.; Walker, Philip Leroy, Jr.; and Castellion, George Augustus, 4,029,600.

American Hoechst Corporation: *See—*
Effland, Richard C.; Davis, Larry; and Schaub, Wolfgang, 4,029,672.

American Home Products Corporation: *See—*
Rakhit, Sumanas, 4,029,810.

American Motors Corporation: *See—*
Bishop, Joseph Gerald, 4,029,337.

AMP Incorporated: *See—*
Ritchie, Leon Thomas; and Harwood, Robert George, 4,028,794.
Scarborough, Grover Harry, 4,029,895.

Ampex Corporation: *See—*
Barlow, Malcolm; and Lundquist, Jerry R., 4,029,541.

Analog Devices, Inc.: *See—*
Brokaw, Adrian Paul, 4,029,974.

Anchor/Darling Valve Company: *See—*
Karpenko, Anatole N., 4,029,290.

Anchor Hocking Corporation: *See—*
Nixdorff, Frank S., 4,028,863.

Anderson, Brian, to Imperial Chemical Industries Limited. Oximes. 4,029,704, Cl. 260-566.00A.

Anderson-Cook, Inc.: *See—*
Killop, James Thomas, 4,028,922.

Anderson, David M.: *See—*
Adamski, Donald F.; and Anderson, David M., 4,029,223.

Anderson, Harold Elden, to McCulloch Corporation. Capacitor discharge ignition circuit. 4,029,998, Cl. 361-256.000.

Anderson, Philip P., to Arkla Industries Inc. Preheater for weak absorbent. 4,028,904, Cl. 62-2.000.

Anderson, Richard C., to Varian Associates. Device for selecting computer operational mode and labeling input controls accordingly. 4,030,094, Cl. 340-365.00R.

Anderson, Richard N., to V. E. Anderson Mfg. Co. Window structure. 4,028,849, Cl. 49-181.000.

Anderson, Roy: *See—*
Schuman, Paul D.; Westmoreland, Geraldine; and Anderson, Roy, 4,029,661.

Ando, Seigo: *See—*
Yamada, Takeo; Ando, Seigo; and Watanabe, Katsujiro, 4,030,027.

Ando, Takatoshi: *See—*
Tezuka, Junichi; and Ando, Takatoshi, 4,029,555.

Andres, Klaus; and Schmidt, Paul Herman, to Bell Telephone Laboratories, Incorporated. $PrNi_5$ as a cryogenic refrigerant. 4,028,905, Cl. 62-3.000.

Andrews, Peter. Pivoting rule. 4,028,814, Cl. 33-94.000.

Angliker, Hans-Joerg: *See—*
Defago, Raymond; Angliker, Hans-Joerg; Holzrichter, Herbert; Kneubuehler, Werner; and Peter, Richard, 4,029,467.

Angulo, Herminio. Pool table canopies. 4,029,313, Cl. 273-2.000.

Ankenman, Thomas W.: *See—*
Blair, Calvin B.; Brinker, Lee J.; and Ankenman, Thomas W., 4,029,155.

Antonini, Eraldo. Composition for the treatment of bacterial-intestinal infections. 4,029,771, Cl. 424-177.000.

Antosz, Frederick J.; Haak, Willard J.; and Wovcha, Merle G., to Upjohn Company, The. Process of producing 9α-hydroxy-3-ketobisnorchol-4-en-22-oic with mycobacterium fortuitum. 4,029,549, Cl. 195-51.00S.

Anvar Agence Nationale de Valorisation de la Recherche: *See—*
Perriniaux, Claude M., 4,030,115.

Aoyagi, Takaaki: *See—*
Umezawa, Hamao; Aoyagi, Takaaki; Takeuchi, Tomio; Hamada, Masa; and Okami, Yoshiro, 4,029,547.

Apgar, Donald Harlem; and Kilburn, Richard Fleming, to International Business Machines Corporation. Bernoulli pick up head with self-restoring anti-tilt improvement. 4,029,351, Cl. 294-64.00B.

Appel, Mel, to Gabriel Industries, Inc. Child's toy. 4,028,843, Cl. 46-1.00R.

Appel, Walter D. Windshield wiper assembly. 4,028,770, Cl. 15-250.420.

Aquatech Composite Materials Limited: *See—*
Hogan, Brian Patrick, 4,029,037.

Arai, Atsuaki: *See—*
Tanaka, Mitsugu; Arai, Atsuaki; Nakazyo, Kiyoshi; and Shiba, Keisuke, 4,029,508.

Arai, Sakuji: *See—*
Tanaka, Minoru; and Arai, Sakuji, 4,029,063.

Arai, Toshiharu: *See—*
Yoshiura, Hirohisa; Arai, Toshiharu; Miyake, Masao; Furuya, Yoshikane; Onogi, Seiji; and Kamizono, Tetsushi, 4,029,877.

Araki, Tomiyasu: *See—*
Mitsui, Shigeo; Araki, Tomiyasu; Niikawa, Kazuhiko; Hosoda, Hideo; Jyo, Yoshio; Yoda, Ryuichiro; Suzuki, Giichi; Iijima, Takasi; Tanaka, Hiroshi; Ochiai, Yasutaka; and Ise, Takashi, 4,029,550.

Araki, Yoshinobu, to Minolta Camera Kabushiki Kaisha. Color encoding filter and method for making the same. 4,029,394, Cl. 350-166.000.

Aratani, Tadatoshi; Nakamura, Shuzo; Nagase, Tsuneyuki; and Yoneyoshi, Yukio, to Sumitomo Chemical Company, Limited. Copper complex. 4,029,683, Cl. 260-438.100.

Aratani, Tadatoshi; Nakamura, Shuzo; Nagase, Tsuneyuki; and Yoneyoshi, Yukio, to Sumitomo Chemical Company, Limited. Asymmetric synthesis of alkyl chrysanthemates. 4,029,690, Cl. 260-468.00H.

Arbee Corporation, The: *See—*
Thompson, Lawrence M., 4,028,956.

Archer, Winfield S.; and Trus, Joseph, to Greenwell, Blaine G. Tools for applying heat in edge banding operations. 4,029,935, Cl. 219-228.000.

Archibald, John Leheup: *See—*
Cavalla, John Frederick; and Archibald, John Leheup, 4,029,801

ARCO Polymers, Inc.: *See—*
Ingram, Alvin R.; and Wright, Harold A., 4,029,869.
Quinlan, John J.; Garland, James J.; and Granda, Jose E., 4,029,613.

Argoudelis, Alexander D.; and Johnson, LeRoy E., to Upjohn Company, The. Process for producing antibiotics U-50,147 and U-51,738. 4,029,548, Cl. 195-80.00R.

Arkla Industries Inc.: *See—*
Anderson, Philip P., 4,028,904.

Armstrong, Calvin N.: *See—*
Sweeney, William T.; Keller, Dennis F.; Harris, Gary R.; and Armstrong, Calvin N., 4,028,940.

Armstrong, John H.; and Kluge, Frank C., to United States of America, Navy. Thermal sensor and current generator. 4,029,859, Cl. 429-112.000.

Armstrong, Robert A., Jr., to Digital Equipment Corporation. Initialization circuit for establishing initial operation of a digital computer. 4,030,073, Cl. 340-172.500.

Arndt, Henry Clifford: *See—*
Woessner, Warren Dexter; Biddlecom, William Gerard; Arndt, Henry Clifford; Peruzzotti, George Peter; and Sih, Charles John, 4,029,698.

Asahi Engineering & Construction Co., Ltd.: *See—*
Mizuochi, Shoken, 4,029,889.

Asahi Kasei Kogyo Kabushiki Kaisha: *See—*
Goto, Tsugio, 4,030,082.

Asako, Tsunehiko: *See—*
Hiraga, Kentaro; Okutani, Tetsuya; Yoshioka, Kouichi; and Asako, Tsunehiko, 4,029,883.

Asano, Masaharu, to Nissan Motor Co., Ltd. Apparatus for controlling the air-fuel mixture ratio of internal combustion engine. 4,029,061, Cl. 123-32.0EE.

Aschenbrenner, Frank A., to Cor, Inc. Process and apparatus for producing spun yarn. 4,028,871, Cl. 57-58.890.

ASEA Aktiebolag: *See—*
Berneryd, Sten; and Grune, Per-Olof, 4,029,922.
Fahlgren, Tord, 4,030,039.

Ashe, John B., to G. D. Searle & Co. Detector construction for a scintillation camera. 4,029,964, Cl. 250-368.000.

Astra Pharmaceutical Products, Inc.: *See—*
Adams, Herbert J. F.; and Takman, Bertil H., 4,029,793
Adams, Herbert J. F.; and Takman, Bertil H., 4,029,794.

Atlantic Research Corporation: *See—*
Olcott, Eugene L., 4,029,844.

Atlantic Richfield Company: *See—*
Curtin, Daniel J., 4,029,571.
Emery, Leonard W., 4,029,148.
Rieve, Robert W.; and Shalit, Harold, 4,029,715.
Smith, Robert H., 4,029,027.

Aubry, Pierre; Marques, Antoine; and Schwartz, Rene, to Groupe Europeen Pour La Technique Des Turbines a Vapeur G.E.T.T. Turbine shaft having inserted disks. 4,029,437, Cl. 416-198.00A.

Aug. Winkhaus: *See—*
Lumme, Edgar, 4,029,919.

Augstein, Joachim; Cairns, Hugh; Hunter, Dennis; and King, John, to Fisons Limited. The treatment of asthma, hay fever or urticaria. 4,029,802, Cl. 424-269.000.

Aumuller, Walter: *See—*
Weber, Helmut; Aumuller, Walter; Muth, Karl; Weyer, Rudi; and Schmidt, Felix Helmut, 4,029,666.

Austen, Alfred R. Method for extrusion. 4,028,919, Cl. 72-56.000.

Austin, Buddy Julian, to Roper Corporation. Work coil for use in an induction cooking appliance. 4,029,926, Cl. 219-10.490.

Austin, Paul Roland; and Brine, Charles James, to University of Delaware, The. Chitin films and fibers. 4,029,727, Cl. 264-186.000.

Auto-Heat, Inc.: *See—*
Winstel, Frank H., 4,028,817.

Automobiles Peugeot: *See—*
Goupy, Marcel; and Roubinet, Pierre, 4,029,350.
Leveque, Rene, 4,028,952.
Steydle, Guy; and Poisson, Bernard, 4,029,125.

Autosonics Inc.: *See—*
Rand, Burton, 4,029,517.

Avar, Lajos; and Hofer, Kurt, to Sandoz Ltd. 2-Hydroxybenzophenone derivatives. 4,029,684, Cl. 260-439.00R.

Aya, Masahiro; Miyamoto, Masao; Fukazawa, Nobuo; and Yamagishi, Masaaki, to Bayer Aktiengesellschaft. Benzyl N,N-hexamethylene-thiolcarbamate compounds and herbicidal compositions. 4,029,646, Cl. 260-239.0BF.

B.F. Goodrich Company, The: *See—*
Kim, Heung Tai; and Wilson, Gary F., 4,029,458.

B & P Enterprises, Inc.: *See—*
Phillips, Jesse O., 4,029,170.

Bachl, Herbert. Fluid-flow machine. 4,029,431, Cl. 415-69.000.

Badische Anilin- & Soda-Fabrik Aktiengesellschaft: *See—*
Seiler, Erhard; Fahrbach, Gerhard; and Stein, Dieter, 4,029,720.

Bailey, Fay W.: *See—*
Rees, Robert L.; and Bailey, Fay W., 4,029,729.

Bailey, Ronald Barry, to General Electric Company. Static inverter control circuit. 4,030,019, Cl. 321-45.00R.

Baker, Peter D.; and Hollands, Denys V., to Smiths Industries Limited. Radiation-detecting devices and apparatus. 4,029,966, Cl. 250-372.000.

Ball Corporation: *See—*
Dollar, David L., 4,029,525.

Ball, Jerrold L.: *See—*
Allan, John H.; Ball, Jerrold L.; Dull, Charles B.; Gabriel, Leo A.; Curtis, Richard E.; and Dervin, Victor J., 4,028,774.

Ballard, Joseph E.: *See—*
Gragson, James T.; and Ballard, Joseph E., 4,029,639.

Balzau, Gerhard: *See—*
Ahrens, Norbert; Klockenbusch, Heinrich; Ritzmann, Horst; Klein, Hans; Balzau, Gerhard; and Schnuckel, Clemens, 4,029,365.

Ban, Itsuki; Kasuya, Takanori; Yano, Kanji; and Maruyama, Kenichi, to Ban, Itsuki. Apparatus for turning rotor for each desirable angle by driving force of capstan drive system. 4,030,134, Cl. 360-92.000.

Banz, D. Michael, to Decision Data Computer Corporation. Optical character recognition system. 4,030,068, Cl. 340-146.3AQ.

Barber, Stanley. Method and apparatus for assembling sheet piling. 4,028,901, Cl. 61-63.000.

Bardoni, Thomas J.; and Markarian, William. Underwater belt and hose clip. 4,028,778, Cl. 24-79.000.

Barcnyi, Bela; Haselmann, Heinrich; and Rieth, Egon, to Daimler-Benz Aktiengesellschaft. Motor vehicle, especially passenger motor vehicle with at least one door on each side. 4,029,353, Cl. 296-28.00R.

Bargellini, Marcello: *See—*
Fox, Anthony E., and Bargellini, Marcello, 4,029,167.

Barger, J. P., to Dynatech Corporation. Cryosurgical probe tip. 4,029,102, Cl. 128-303.100.

Barker, Herbert J. Electrically operated locking mechanism. 4,030,071, Cl. 340-164.00R.

Barker, Sidney L. Retractable blade for a helicopter rotor. 4,029,435, Cl. 416-88.000.

Barlow, George J., to Honeywell Information Systems, Inc. Data processing system having distributed priority network. 4,030,075, Cl. 340-172.500.

Barlow, Malcolm; and Lundquist, Jerry R., to Ampex Corporation. Magnetic recording disc of improved durability having tin-nickel undercoating. 4,029,541, Cl. 427-130.000.

Barmag Barmer Maschinenfabrik Aktiengesellschaft: *See—*
Schippers, Heinz; and Koslowski, Gerhard, 4,029,452.

Barnett, Robert D.: *See—*

Jancic, Gojko; Meylan, Pierre; and Portmann, Alexandre, 4,028,909.
Korb, Fritz, 4,030,020.
Meylan, Pierre; and Brunner, Heinz, 4,029,432.

Beatty, Theodore R.; and Vourlis, Harry, to Union Carbide Corporation. Heat-treated, corona-treated polymer bodies and a process for producing them. 4,029,876, Cl. 526-344.000.

Beavon, David K., to Ralph M. Parsons Company. Sulfur plant temperature control. 4,029,753, Cl. 423-574.00R.

Bechard, Conrad E.; Davenport, John M.; Herrmann, William H.; and Lovrekovic, Steven N., to General Electric Company. Method of making electrical connections. 4,028,798, Cl. 29-628.000.

Beckers, Johannes: *See—*
Dhein, Rolf; Schoeps, Jochen; Beckers, Johannes; and Kuchenmeister, Rolf, 4,029,617.

Beckman Instruments, Inc.: *See—*
Nather, Roy E., 4,029,401.
Sharples, Thomas Davy, 4,029,473.

Beckmann, Klaus; and Behr, Heinrich, to Gewerkschaft Eisenhutte Westfalia. Longwall mining roof support for double deck machines. 4,029,361, Cl. 299-31.000.

Bedell, Robert J.; and Franseen, Richard E., to United States of America, Army. Automatic video processing for high-performance CRT displays. 4,030,125, Cl. 358-169.000.

Beecham Group Limited: *See—*
Clark, Dennis Edward; and Blyth, Robert Charles, 4,029,804.

Beguin, Jean-Luc: *See—*
Droz, Willy; and Beguin, Jean-Luc, 4,028,878.

Behr, Heinrich: *See—*
Beckmann, Klaus; and Behr, Heinrich, 4,029,361.

Behringwerke Aktiengesellschaft: *See—*
Helting, Torsten Bertil, 4,029,765.
Helting, Torsten Bertil, 4,029,766.

Beigler, Myron A.; and Amen, Ronald J., to Syntex (U.S.A.) Inc. Composition and method of treating ulcers. 4,029,773, Cl. 424-180.000.

Beiter, Glenn A.; and Evert, Donald A., to Honeywell Inc. Slack tape loader. 4,030,131, Cl. 360-71.000.

Belart, Juan, to ITT Industries, Inc. Booster brake unit. 4,028,891, Cl. 60-550.000.

Belentepe, Yilmaz C.; and Blanding, Wendell S., to Corning Glass Works. Television picture tube face plate. 4,029,898, Cl. 358-247.000.

Bell, George E., to Xerox Corporation. Toner handling system. 4,029,047, Cl. 118-652.000.

Bell, H. Clark, Jr.; and Rosen, Harold A., to Hughes Aircraft Company. Contiguous channel multiplexer. 4,029,902, Cl. 179-15.0FD.

Bell & Howell Company: *See—*
Perret, Ludwig A., 4,030,128.

Bell, John T., to Container Corporation of America. Machine and method for packaging flat articles such as paperback books or the like. 4,028,864, Cl. 53-24.000.

Bell, Richard L.; and Lamb, Matthew J., to United States of America, Navy. Ventilated helmet with selected weight distribution. 4,028,739, Cl. 2-6.000.

Bell, Robert P.: *See—*
Graham, Thomas E.; Thaxton, George H.; Mitchell, Francis M., and Bell, Robert P., 4,029,832.

Bell Telephone Laboratories, Incorporated: *See—*
Addeo, Eric John, 4,029,900.
Andres, Klaus; and Schmidt, Paul Herman, 4,028,905
Boll, Harry Joseph, 4,030,083.
Chemelli, Robert Guido; Cook, Dwight Dexter; and Miller, Richard Carrel, 4,030,122.
Chinnock, Edwin Leroy; and Gloge, Detlef Christoph, 4,029,390.
Geigel, Alfred Antonio; and LaMarche, Robert Ernest, 4,029,912.

Headington, Edward E.; Tutko, Albert J.; and Knickerbocker, Robert H., 4,029,376.
Kakalec, Robert John, 4,030,025.
Ngo, Peter Dinh-Tuan, 4,030,091.

Bellagamba, Pietro. Heat-insulating panels. 4,028,859, Cl. 52-393.000.

Bemmerl, Hans-Ferdinand. *See*—
Blumenthal, Gunter; and Bemmerl, Hans-Ferdinand, 4,028,898.

Benavides, Augusto E.: *See*—
Gillemot, George W.; Gamero, Robert; Benavides, Augusto E.; and Elms, Robert James, 4,029,626.

Benckiser-Knapsack GmbH: *See*—
Sommer, Klaus; and Raab, Guenter, 4,029,696.
Sommer, Klaus; and Weber, Hermann, 4,029,742.

Bender, Werner; Bergner, Dieter; Hannesen, Kurt; Hund, Helmut; and Schulte, Wilfried, to Hoechst Aktiengesellschaft. Electrolytic apparatus. 4,029,565, Cl. 204-256.000.

Bendix Corporation, The: *See*—
Krantz, Leonard Albert, Jr.; and Fort, Jack Bernard, 4,029,386.

Bendler, Hellmut: *See*—
Hubsch, Gunter; Bendler, Hellmut; and Stahlmann, Rudolf, 4,029,017.

Benedict, Andrew G.; Marker, Thomas E.; and Schmidt, Herbert J., to MCP Facilities Corporation. Stock handling apparatus. 4,029,214, Cl. 214-1.00P.

Benerito, Ruth R.: *See*—
Ward, Truman L.; Benerito, Ruth R.; and Hebert, Jacques J., 4,029,533.

Bennett, Donald Alfred, to International Synthetic Rubber Company, Limited, The. Soil stabilization composition. 4,028,897, Cl. 61-36.00C.

Bennett, James C., to Rosen, Ralph S. Blade guard lift for power saw. 4,028,975, Cl. 83-397.000.

Bennett, Thomas H.; Carlow, Earl F.; Kouvoussis, Anthony E.; Orgill, Rodney H.; Peddle, Charles; and Wiles, Michael F., to Motorola, Inc. Processor including incrementor and program register structure. 4,030,079, Cl. 340-172.500.

Bentley Engineering Company, Ltd., The: *See*—
Wignall, Harry; Shelton, William Ewart Alan; and Klee, John Michael, 4,028,910.

Berenson, Herman: *See*—
Lies, Thomas Andrew; and Berenson, Herman, 4,029,652.

Berg, Jeffrey H.: *See*—
Haas, Gerhard J.; and Berg, Jeffrey H., 4,029,701.

Bergamini, Giorgio, to Nuovo Pignone, S.p.A. Protection system for the overpressures of a silicium wafer sensor used in a differential pressure transmitter. 4,028,945, Cl. 73-395.000.

Bergdolt, Paul F., to General Motors Corporation. Rear dump operating mechanism. 4,029,358, Cl. 298-19.00B.

Berger, Christian; Farge, Daniel; Gros, Georges; Messer, Mayer Naoum; and Moutonnier, Claude, to Rhone-Poulenc Industries. 1,4-Dithiin (and oxathiin)-yl cephalosporin derivatives, and compositions containing them. 4,029,781, Cl. 424-246.000.

Bergner, Dieter: *See*—
Bender, Werner; Bergner, Dieter; Hannesen, Kurt; Hund, Helmut; and Schulte, Wilfried, 4,029,565.

Bergstrom, Arthur Everett. Method of making a blast joint. 4,028,796, Cl. 29-416.000.

Berkes, Benjamin L., to General Motors Corporation. Seal assembly for control lever. 4,029,324, Cl. 277-30.000.

Berkowitz, Sidney, to FMC Corporation. Crude cyanuric acid purification. 4,029,660, Cl. 260-248.00A.

Berlin, David L. Automobile material carrier. 4,029,245, Cl. 224-42.430.

Berls, Richard Warren: *See*—
Secrist, George Richard; Berls, Richard Warren; and Schlegel, Brooke Pershing, 4,029,504.

Berman, Paul A.: *See*—

Coffman, Charles L.; Kellerhals, Glen F.; Newcombe, Jack; and Roth, Shirley H., 4,029,570.

Clark, Allan; and Kirkwood, Philip Robert, to British Steel Corporation. Welding, and a steel suitable for use therein. 4,029,934, Cl. 219-145.000.

Clark, Dennis Edward; and Blyth, Robert Charles, to Beecham Group Limited. Injectable amoxycillin compositions. 4,029,804, Cl. 424-271.000.

Clark, Frederick G., to Eastman Machine Company. Grounding attachment plug and terminal block assembly for cloth cutting machine. 4,029,372, Cl. 339-14.00R.

Clark, James Monroe, to International Telephone and Telegraph Corporation. Digital double differential phase-locked loop. 4,030,045, Cl. 331-1.00A.

Clark, Norman E. Release mechanism for fishing apparatus. 4,028,837, Cl. 43-43.120.

Clarke, John Michael, to Caterpillar Tractor Co. Sealing bolt seat for rotary piston machine. 4,029,444, Cl. 418-120.000.

Clarke, Peter Alec; Starkey, Stanley Victor; and Stone, William Alfred, to Molins Limited. Apparatus for handling cigarettes or other rod-like articles. 4,029,197, Cl. 198-425.000.

Clarke, William Arthur. Game ball. 4,029,316, Cl. 273-58.00K.

Clarridge, Glenn E., to Ford Industries, Inc. Tape drive with floating-plate-mounted drive spindles. 4,029,269, Cl. 242-201.000.

Cleghorn, John W.: *See—*
Davis, Marion H.; and Cleghorn, John W., 4,029,187.

Clough, Roy L., Jr.; and Snow, John F., to Xodar Corporation. Aerating system. 4,029,581, Cl. 210-220.000.

Cloup, Jean. Apparatus for positioning tools. 4,029,427, Cl. 408-3.000.

Clouth Gummiwerke AG: *See—*
Hartmann, Ewald; and De Blick, Hendrik, 4,029,296.

Coffman, Charles L.; Kellerhals, Glen F.; Newcombe, Jack; and Roth, Shirley H., to Cities Service Company. Process for recovering crude oil from an underground reservoir. 4,029,570, Cl. 208-188.000.

Cole, Ann Mary; Turner, John Angus William; and Snell, Brian Kenneth, to Imperial Chemical Industries Limited. Pyrimidine sulfamate fungicides. 4,029,784, Cl. 424-248.500.

Cole, David J.: *See—*
Zerobnick, Alan H.; and Cole, David J., 4,029,243.

Cole, Lewis C., to United States of America, Army. Plural mode fuze. 4,029,016, Cl. 102-69.000.

Colgate-Palmolive Company: *See—*
Carson, John C., Jr.; Hall, Robert T.; Kenkare, Divaker B.; and Robbins, Clarence R., 4,029,236.
Chesky, Sheldon R.; and Patience, Donald, 4,029,101.
Karami, Hamzeh, 4,029,098.
Karami, Hamzeh, 4,029,100.

Collet, Jean-Jacques. Apparatus for cutting bitumen cakes. 4,028,974, Cl. 83-171.000.

Colletti, Vincent, Jr.: *See—*
Shoup, Edgar C., Jr.; and Colletti, Vincent, Jr., 4,029,436.

Collington, Kenneth Thomas, to Fisons Limited. Silica containing blowing agent compositions as plate-out preventives in foamed plastics processes. 4,029,612, Cl. 260-2.50E.

Colt Industries Operating Corporation: *See—*
Rictveld, Frank P., 4,029,929.

Coltrin, George E.: *See—*
Adams, Clifton G.; Dallas, Carl B.; and Coltrin, George E., 4,029,216.

Coltrinari, Enzo L., to Tajima Roofing Co., Ltd. Recovery of antimony sulfides. 4,029,741, Cl. 423-179.000.

Comer, Robert E. Bone end shield for meat cuts. 4,029,822, Cl. 426-124.000.

Commissariat a l'Energie Atomique: *See—*
Faugeras, Pierre; Miquel, Pierre; and Robaglia, Michele, 4,029,733.

Communications Technology Corporation: *See—*
Gillemot, George W.; Gamero, Robert; Benavides, Augusto E.; and Elms, Robert James, 4,029,626.

Compagnie Industrielle des Telecommunications Cit-Alcatel: *See—*
Abraham, Michel, 4,029,905.

Composite Technology, Inc.: *See—*
Green, Andrew, 4,029,172.

Confalone, Pasquale Nicholas; Uskokovic, Milan Radoje; and Pizzolato, Giacomo, to Hoffmann-La Roche Inc. Synthesis of biotin. 4,029,647, Cl. 260-239.30B.

Consolidated Medical Equipment, Inc.: *See—*
Corasanti, Eugene R., 4,029,086.

Construction Specialties, Inc.: *See—*
Bartlett, Gary F., 4,029,834.

Container Corporation of America: *See—*
Bell, John T., 4,028,864.
Bolduc, Wayne J.; Cave, Vernon E.; and Chase, Edward J., 4,029,230.

Evani, Syamalarao; and Corson, Frederick P., 4,029,874.
Coston, Semer H. Oscillating piston rotary machine. 4,029,059, Cl. 123-18.00R.
Cottingham, Hugh; and Scrocco, Joseph, to BHN, Inc. Plant light sensor adaptor. 4,029,959, Cl. 250-239.000.
Cottingham, Hugh V.; and Scrocco, Joseph, to Black Hole Nebula Incorporated. Plant comparator. 4,029,418, Cl. 356-168.000.
Cotton, John F.; Hanks, Jack G.; and Wien, Raymond E., to Westinghouse Electric Corporation. Distribution transformer secondary circuit breaker having cantilevered contacts. 4,030,053, Cl. 335-15.000.
Cotton, Lnu S.: *See—*
Murphy, Richard D.; and Cotton, Lou S., 4,029 271.
Courson, Thomas G.; Schlueter, William L.; and Kelly, Thomas T., to Central Illinois Tile co. Apparatus for laying elongated flexible tubing. 4,028,902, Cl. 61-72.600.
Courty, Philippe; Sugier, Andre; Raynal, Bernard; and Berrebi, Georges, to Societe Francaise des Produits pour Catalyse. Decomposing nitrogen oxides with nickel-iron-chromium catalysts. 4,029,738, Cl. 423-213.200.
Couto, Luis R., to Thomas & Betts Corporation. Hand tool for working on electrical conductors. 4,028,756, Cl. 7-5.500.
Coviello, Claire V.: *See—*
Coviello, Louis M.; and Coviello, Claire V., 4,028,769.
Coviello, Louis M.; and Coviello, Claire V. Apparatus for cleaning chimney flues. 4,028,769, Cl. 15-249.000.
Cowan, Robert L., II: *See—*
Gordon, Gerald M.; and Cowan, Robert L., II, 4,029,545.
Cowen, Steven J., to United States of America, Navy. Film-recording noise dosimeter. 4,028,947, Cl. 73-557.000.
Cox, C. Eugene. Harness assembly test system. 4,030,029, Cl. 324-66.000.
Cragne, Edward J., Jr.; and Schultz, Everett M., to Merck & Co., Inc. Substituted 2-aminomethyl-6-iodnphenols 4,029,816, Cl. 424-316.000.
Cragoe, Edward J., Jr.: *See—*
Hunter, Norman R.; Rooney, Clarence S.; Rokach, Joshua; and Cragoe, Edward J., Jr., 4,029,803.
Crann, Richard N., to General Tire & Rubber Company, The. Nondestructive testing of tire wear. 4,028,937, Cl. 73-146.000.
Crase, Gary Monroe: *See—*
Tschirky, John E.; and Crase, Gary Monroe, 4,029,368.
Cravens, Cecil W. Connecting device. 4,028,981, Cl. 84-327.000.
Craver, Robert J.: *See—*
Nagy, William L.; and Craver, Robert J., 4,029,990.
Cretella, Salvatore J.; Bernardo, Matthew; and De Musis, Ralph T. Refurbished turbine vanes and method of refurbishment thereof. 4,028,787, Cl. 29-156.80B.
Criley, Ronald L.: *See—*
Frost, Richard H.; and Criley, Ronald L., 4,028,948.
Cromer, George Phillip; Hazen, Harry Harold; and Pensabene, Saverio, to General Electric Company. Sintered porous plaque battery plates and method of making same. 4,029,856, Cl. 429-94.000.
Cronin, Eamon P.: *See—*
Ganley, Thomas J.; and Cronin, Eamon P., 4,028,885.
Crosby, Guy A., to Dynapol. Reduction with polymeric reagent. 4,029,706, Cl. 260-570.900.
Crosby, John; Rennie, Robert Allan Campbell; and Paton, Robert Michael, to Imperial Chemical Industries Limited. Production of isocyanates. 4,029,686, Cl. 260-453.00P.
Cross, Barrington; and Walworth, Bryant Leonidas, to American Cyanamid Company. Novel 1,2-dialkylpyrazolium compounds having 3-(or 3,5-) nitrogen-containing heterocyclic group as herbicides. 4,029,492, Cl. 71-92.000.
Crossley, Roger: *See—*

De Simone, Robert S.; and Gradeff, Peter S., to Rhodia, Inc. Process for the hydrogenation of citral to citronellal and of citronellal to citronellol using chromium-promoted Raney nickel catalyst. 4,029,709, Cl. 260-601.00R.
DeSisto, Richard E.; and Mikituk, Murray M., to General Signal Corporation. Can opener latch for releasing cutting assembly 4,028,807, Cl. 30-419.000.
Dessauer, Rolf, to Du Pont de Nemours, E. I., and Company. Universal product code marking composition containing a photosensitive dye former, a pigment and a binder and the use thereof. 4,029,506, Cl. 96-48.00R.
Dettre, Robert Harold; and Greenwood, Edward James, to Du Pont de Nemours, E. I., and Company. Aqueous dispersions of perfluoroalkyl esters for treating textiles. 4,029,585, Cl. 252-8.600.
Dew, Brock S., to Charles Stark Draper Laboratory, Inc., The. Servo-controlled microscope stage. 4,029,949, Cl. 235-151.110.
DeWitt, David P.; Hannemann, Robert E.; and Wiechel, John F., to Purdue Research Foundation. Method for determining bilirubin concentration from skin reflectance. 4,029,085, Cl. 128-2.00R.
Dey, James. Automatic motor kill system for preventing damage to a heavy equipment motor due to a dirty air filter. 4,029,073, Cl. 123-198.00D.
Dezael, Claude; Renault, Philippe; and Deschamps, Andre, to Institut Francais du Petrole des Carburants et Lubricants et Enterprise de Recherches et d'Activities Petroliers Elf. Process for reducing molten ammonium sulfates containing metallic impurities to ammonia and sulfur dioxide. 4,029,745, Cl. 423-356.000.
Dhein, Rolf; Schoeps, Jochen; Beckers, Johannes; and Kuchenmeister, Rolf, to Bayer Aktiengesellschaft. Process for the production of water-dilutable binders based on air-drying short-oil alkyd resins. 4,029,617, Cl. 260-20.000.
Diamond Shamrock Corporation: *See—*
Rowe, Edward A., Jr.; and Cawley, William H., 4,029,523.
Dickason, William C.: *See—*
Pond, David M.; Dickason, William C.; and Elam, Edward U., 4,029,670.
Diderikscn, Erling Thue; and Knudsen, Jens Nygaard, to Interlego A.G. Toy building block for supplementing existing block sets. 4,028,844, Cl. 46-22.000.
Dieckmann, Dale J., to Dart Industries Inc. Vinyl halide stabilizer compositions of antimony organic sulfur-containing compounds and ortho-dihydric phenols. 4,029,618, Cl. 260-23.0XA.
Diehl, Reiner; and Lutkemeyer-Hohmann, Margitta, to Fried, Krupp Gesellschaft mit beschrankter Haftung. Direction determination in sonar systems. 4,030,062, Cl. 340-3.00R.
Dietmann, Karl: *See—*
Wiedemann, Fritz; Thiel, Max; Stach, Kurt; Dietmann, Karl; and Sponer, Gisbert, 4,029,783.
Dietrich, Dave S., to HydroTech International, Inc. Method and apparatus for maneuvering pipe ends in a subsea location. 4,028,903, Cl. 61-110.000.
Dietsche, Thomas J., to Dow Chemical Company, The. 6,7-Dichloro-3,4-dihydro-2H-pyrazino(2,3-B)(1,4)oxazines. 4,029,657, Cl. 260-244.00R.

Diggs, Richard E. Fireproof modular building. 4,028,854, Cl. 52-93.000.

Digital Equipment Corporation: *See—*
Armstrong, Robert A., Jr., 4,030,073.

Dillard, Beverly M.; and Welbon, William W., to United States of America, Energy Research and Development Administration. Process for making calcium chromate. 4,029,735, Cl. 423-596.000.

Dille, William A.; and Erickson, Wayne E., to Minnesota Mining and Manufacturing Company. Internal fishing rod ferrule. 4,029,424, Cl. 403-292.000.

Dillon, Jan J., to F.E.I., Inc. Troughed rollers for bulk material handling. 4,029,200, Cl. 198-830.000.

DiMercurio, John S.: *See—*
Theodore, Michael J.; and DiMercurio, John S., 4,029,573.

Dischert, Robert Adams, to RCA Corporation. Color encoding camera utilizing comb filtering for color signal separation. 4,030,118, Cl. 358-5.000.

Dlugos, Daniel F.: *See—*
Canevari, Louis T.; Coppola, Vincent G.; Dlugos, Daniel F.; Freeman, Gerald C.; and Manduley, Flavio M., 4,030,070.

Dobler, Peter: *See—*
Schoettle, Klaus; Wittkamp, Heinrich; Gliniorz, Lothar; and Dobler, Peter, 4,029,268.

Dobrosielski, Stephen S.: *See—*
Frank, Stanley L.; and Dobrosielski, Stephen S., 4,029,924.

Dobson, Allan E. Spent cartridge collector. 4,028,834, Cl. 42-1.00T.

Dr. C. Otto & Comp. G.m.b.H.: *See—*
Haese, Egon, 4,029,055.

Doemen, Benno, to Papst-Motoren KG. Brushless d.c. motor having rotor position-dependent control means. 4,030,005, Cl. 318-138.000.

Dohi, Michio: *See—*
Denda, Yasuaki; Kadowaki, Takashi; and Dohi, Michio, 4,029,625.

Dolan, John E. Clothes hanger. 4,029,239, Cl. 223-85.000.

Dolfini, Joseph E.; Bohme, Ekkehard; and Slusarchyk, William A., to E. R. Squibb & Sons, Inc. 6-Benzalimino-6-arylthio penicillanic acids and derivatives thereof. 4,029,669, Cl. 260-306.70C.

Dolfini, Joseph Edward, to E. R. Squibb & Sons, Inc. 7-Methoxy 7-alpha-ureidothienylacetamidocephalosporins. 4,029,653, Cl. 260-243.00C.

Dolfini, Joseph Edward, to E. R. Squibb & Sons, Inc. 7-Methoxy phenylureidocephalosporins. 4,029,654, Cl. 260-243.00C.

Doll, Brendan L., to Cellu Products Company. Apparatus for forming a stretchable tubular packaging material. 4,029,539, Cl. 156-513.000.

Dollar, David L., to Ball Corporation. High strength wrought zinc alloy. 4,029,525, Cl. 148-32.000.

Donatelli, Lee A.: *See—*
Wright, Harold E.; and Donatelli, Lee A., 4,030,003.

Dorme, Nicole: *See—*
Fauran, Claude P.; Dorme, Nicole; Raynaud, Guy M.; and Eberle, Jeannine, 4,029,789.

Dorn, Conrad P.; and Yang, Shu S., to Merck & Co., Inc. Peptide carbazates. 4,029,772, Cl. 424-177.000.

Dorr, Karl-Heinz; Grimm, Hugo; Weber, Waldemar; Tacke, Michael; and Schmidt, Georg, to Metallgesellschaft Aktiengesellschaft. Process for producing sulfuric acid. 4,029,751, Cl. 423-522.000.

Dougherty, Thomas John; and Bast, Victor William, to Globe-Union Inc. Storage battery and method of making the same. 4,029,855, Cl. 429-82.000.

Douglas Dynamics Corporation: *See—*
Simonds, George D., Jr., 4,028,820.

Dow Badische Company: *See—*
Hurley, Rupert B.; Eastwood, Frederick B.; and Mann, Joe A., 4,029,725.

Farnand, Joseph Redmond; and Puddington, Ira Edwin, to Canadian Patents and Development Limited. Solids recovery from coal liquefaction slurry. 4,029,567, Cl. 208-8.000.

Farnia, Ken, to A. O. Smith Corporation. Gas burning apparatus. 4,029,451, Cl. 126-361.000.

Faroudja, Yves C. Video crispener. 4,030,121, Cl. 358-37.000.

Farrand Optical Co., Inc.: *See—*
Shenker, Martin, 4,029,396.

Fattori, Silvano: *See—*
Rossi, Enzo; Fattori, Silvano; and Imparato, Luigi, 4,029,586.

Faugeras, Pierre; Miquel, Pierre; and Robaglia, Michele, to Commissariat a l'Energie Atomique. Extraction of metals from sea nodules. 4,029,733, Cl. 423-21.000.

Fauran, Claude P.; Derme, Nicole; Raynaud, Guy M.; and Eberle, Jeannine, to Delalande S.A. 1-[2'-(α-Furoyl or α-thicnoyl)cth-1'-yl]-2-(4''-cinnamyl piperazin-1''-yl methyl)benzimidazoles and method of using same. 4,029,789, Cl. 424-250.000.

Fauran, Claude P.: *See—*
Raynaud, Guy M.; Pourrias, Bernard M.; Fauran, Claude P.; and Turin, Michel J., 4,029,650.

Faust, Robert C., to Will Ross, Inc. Tracheostomy and endotracheal units. 4,029,105, Cl. 128-351.000.

Fecker, Josef; and Memminger, Gustav, to Gustav Memminger Verfahrenstechnik fuer die Maschenindustrie, Firma. Inclined pin wheel for yarn storage drum. 4,028,911, Cl. 66-132.00R.

Federal Business Products, Inc.: *See—*
Neill, Jimmie D.; and Wise, Lester V., 4,029,341.

Federal Paper Board Company, Inc.: *See—*
Manizza, Guelfo A., 4,029,204.

Fellows, Mark W., to North American Philips Corporation. Electric discharge lamp with voltage multiplier circuit having a capacitance which changes with temperature. 4,029,989, Cl. 315-51.000.

Feng, Bai-Cwo; and Lechaton, John S., to International Business Machines Corporation. Forming feedthrough connections for multilevel interconnections metallurgy systems. 4,029,562, Cl. 204-192.0EC.

Ferag AG: *See—*
Reist, Walter, 4,029,310.

Ferluga, Benjamin A. Micro-precision timed firing handgun. 4,028,994, Cl. 89-161.000.

Fernandez Brana, Miguel: *See—*
Martinez Roldan, Cristobal; Fernandez Brana, Miguel; and Castellano Berlanga, Jose Maria, 4,029,807.

Ferrari, Alain; and Suppa, Vito, to Thomson-CSF. Cooling device for components which dissipate large amounts of heat. 4,029,141, Cl. 165-80.000.

Ferrari, Giorgio: *See—*
Casagrande, Cesare; and Ferrari, Giorgio, 4,029,664.

Fetter, Edward Joseph: *See—*
Burkhard, Herbert; Hsu, Nelson Nae-Ching; and Fetter, Edward Joseph, 4,029,624.

Feurstein, Ludwig J.; Meives, Otis E.; and Scholk, Roger E., to Pemco, Inc. Automatic indexing and transferring apparatus. 4,029,194, Cl. 198-358.000.

Fex, Hans Jacob; Hogberg, Knut Bertil; and Konyves, Imre, to Aktiebolaget Leo. Cortical steroid nitrogen mustard compositions and treatment therewith. 4,029,778, Cl. 424-243.000.

Fiberglas Canada Limited: *See—*
Lacon, John W., 4,029,461.

Fichtel & Sachs A.G.: *See—*
Butz, Hans, 4,029,179.

Fickler, Hans; and Frankhauser, Walter, to Aktiengesellschaft Fur Rationelle Verpackung. Packaging receptacle for printed boards. 4,029,208, Cl. 206-454.000.

Ficberg, Russell F. Contact retention test tool. 4,028,812, Cl. 33-169.00B.

Fifield, Loretta Alice. Urine drainage apparatus. 4,029,099, Cl. 128-295.000.

Figlia, Anthony G., to F. G. Waide, Inc. Can opener. 4,028,805, Cl. 30-403.000.

Findlay, John William Addison: *See—*
Tovey, Keith Charles; and Findlay, John William Addison, 4,029,880.

Fink, Hans-Ferdi; Koerner, Gotz; and Rossmy, Gerd, to Th. Goldschmidt AG. De-emulsifier for breaking petroleum emulsions. 4,029,596, Cl. 252-329.000.

Finley, Joseph H., to FMC Corporation. Dextrin carboxylates and their use as detergent builders. 4,029,590, Cl. 252-89.00R.

Firester, Arthur Herbert, to RCA Corporation. Prealigned laser mount and method of making same. 4,030,046, Cl. 331-94.50D.

Firmenich S.A.: *See—*
Demole, Edouard, 4,029,106.

Mitsui, Shigeo; Araki, Tomiyasu; Niikawa, Kazuhiko; Hosoda, Hideo; Jyo, Yoshio; Yoda, Ryuichiro; Suzuki, Giichi; Iijima, Takasi; Tanaka, Hiroshi; Ochiai, Yasutaka; and Ise, Takashi, 4,029,550.
Japan Steel Works Ltd., The: *See—*
Morishima, Yukimasha; Yoshida, Minoru; and Hanaki, Kimiyasu, 4,029,300.
Japan Tobacco & Salt Public Corporation, The: *See—*
Nakai, Saburo; and Koyama, Nobuyuki, 4,029,221.
Jarowenko, Wadym; and Hernandez, Henry R., to National Starch and Chemical Corporation. Method of making a novel starch derivative and the product produced thereby. 4,029,544, Cl. 162-175.000.
Jarque, Ricardo Granados: *See—*
Cartes, Juan Bosch; Cabiro, Jorge Canals; Jarque, Ricardo Granados; Roldan, Cristobal Martinez; and Peinado, Fernando Rabadan, 4,029,799.
Jarvis, Frank L. J.; Gunn, Duncan A.; and Buchanan, Richard J., to International Standard Electric Corporation. Submerged repeater housing. 4,029,894, Cl. 174-70.00S.
Jasny, Jan, to Polska Akademia Nauk, Instytut Chemii Fizycznej. Reading device for a monochromator. 4,029,417, Cl. 356-100.000.
Jasso, Joseph J.: *See—*
Hunter, Lee; and Jasso, Joseph J., 4,029,369.
Jaunarajs, Karlis L.; and Yang, Julie C., to Johns-Manville Corporation. Method for the preparation of fibrous insoluble calcium sulfate anhydrite. 4,029,512, Cl. 106-109.000.
Jeff-Ko Manufacturing Co., Inc.: *See—*
Hoch, Norris R., 4,029,356.
Jenkins, Patrick A.; and Reinke, Ronald E., to Borg-Warner Corporation. Thermally actuated valve. 4,029,257, Cl. 236-48.00R.
Jenner, Al. Tap holder. 4,028,763, Cl. 10-135.00R.
Jennings, Larry D.: *See—*
Stevens, Douglas; Forberg, Helge O.; Jennings, Larry D.; Thompson, David L.; and Copenhaver, Julian V., 4,029,737.
Jenoptik Jena G.m.b.H.: *See—*
Hecker, Gerhard Ernst; Klose, Heinrich Peter; and Muller, Wilfried Friedrich Heinrich, 4,030,109.
Jeram, Edward M., to General Electric Company. Solvent resistant room temperature vulcanizable silicone rubber composition. 4,029,629, Cl. 260-37.0SB.
Jett, Marion Barney, to Dresser Industries, Inc. Gripping member for well packer. 4,029,147, Cl. 166-217.000.
Joh. A. Benckiser GmbH: *See—*
Krueger, Friedrich; and Michel, Walter, 4,029,697.
Johansson, Leif A. T.; and Pers, Nils G., to Tipe Revent AB. Method for baking food products. 4,029,463, Cl. 432-25.000.
John Wyeth & Brother Limited: *See—*
Cavalla, John Frederick; and Archibald, John Leheup, 4,029,801.
Curran, Adrian Charles Ward. 4,029,667.
Curran, Adrian Charles Ward; Crossley, Roger; and Hill, David George, 4,029,668.
John Zink Company: *See—*
Hart, Wallace F.; and Koenig, Ralph A., 4,029,146.
Johns-Manville Corporation: *See—*
Jaunarajs, Karlis L.; and Yang, Julie C., 4,029,512.
Johnson, Allan S. Ball drive non-reversing tapping attachment. 4,029,429, Cl. 408-142.000.
Johnson, Bruce K., to Polaroid Corporation. Photographic apparatus having a reflex optical system. 4,030,110, Cl. 354-152.000.
Johnson, Edward M., Jr.; and Stone, John T., to Triangle Corporation, The. Plastic hinge construction. 4,029,234, Cl. 220-337.000.
Johnson, James M.: *See—*
Harrington, Cecil F.; Johnson, James M.; and Prince, Howard T., 4,028,852.
Johnson, Kenneth C., to F. J. Littell Machine Company. Roll feed with modular roll lifter mechanism. 4,029,251, Cl. 226-154.000.
Johnson, LeRoy E.: *See—*
Argoudelis, Alexander D.; and Johnson, LeRoy E., 4,029,548.
Johnson Matthey & Co., Limited: *See—*
Westwood, Walter; MacGregor, John James; and Payne, John Blunden, 4,029,499.

Johnson, Phillip R., to Dakota Electron, Inc. Laser land-surveying apparatus with digital display. 4,029,415, Cl. 356-4.000.

Johnson, Robert B.: *See—*
Fisher, Edwin P.; and Johnson, Robert B., 4,030,084.

Johnston, Thomas E., to Du Pont de Nemours, E. I., and Company. Hydrocarbon fuel compositions containing polysulfone antistatic additives. 4,029,480, Cl. 44-62.000.

Jones, Charles, to Curtiss-Wright Corporation. Stratified charge rotary engine with side housing fuel injection. 4,029,058, Cl. 123-8.090.

Jones, Christopher Robin; Williams, Malcolm; and Adey, Anthony John, to Cav Limited. Fuel systems for internal combustion engines. 4,029,068, Cl. 123-139.00E.

Jones, Frank N., to Du Pont de Nemours, E. I., and Company. Polymeric materials with acid end groups. 4,029,861, Cl. 526-14.000.

Jones, Glen D.; and Raffetto, Michael J., to Xerox Corporation. Means for wiring into a sealed enclosure. 4,029,373, Cl. 339-17.00R.

Jones, Gomer W., to Bird Oil Equipment Ltd. Speed reducer box for driving a pump jack. 4,028,964, Cl. 74-606.00R.

Jones, Ronald N.: *See—*
Hauser, Hans; and Jones, Ronald N., 4,028,960.

Jonsson, Knut Johan Vilhelm, to AB Wicanders Korkfabriker. Pilferproof closure for bottles, tubes and similar containers. 4,029,231, Cl. 215-256.000.

Joosten, Hendrik C. J.: *See—*
Wilms, Gerard J. M.; and Joosten, Hendrik C. J., 4,028,764.

Jorgensen, Adam A.; Rose, Norman L.; and Lewis, Thomas F., to Stromberg-Carlson Corporation. Asynchronous digital repeater. 4,029,907, Cl. 179-16.0EA.

Joslyn Mfg. and Supply Co.: *See—*
Yonkers, Edward H., 4,029,380.

Joyce, James Maurice: *See—*
Herko, Joseph Michael; and Joyce, James Maurice, 4,030,015.

Judkins, Ren. Foldable brushes. 4,028,767, Cl. 15-203.000.

Jueckstock, Dale Allen; and Hindman, Thomas Wayne, Sr., to McKellar, Robert L., a part interest. Method of threading short spool pieces. 4,028,762, Cl. 10-1.00B.

Juhasz, Charles, to Aircraft Systems Corporation. Differential pressure indicator device. 4,029,042, Cl. 116-114.0PV.

Jurd, Leonard; and Bultman, John Dale, to United States of America, Agriculture. Process for inhibiting the deterioratinn of wood duc to marine boring organisms via the use of dibutylbenzylphenol. 4,029,818, Cl. 424-346.000.

Jyo, Yoshio: *See—*
Mitsui, Shigen; Araki, Tomiyasu; Niikawa, Kazuhiko; Hosoda, Hideo; Jyo, Yoshio; Yoda, Ryuichiro; Suzuki, Giichi; Iijima, Takasi; Tanaka, Hiroshi; Ochiai, Yasutaka; and Ise, Takashi, 4,029,550.

Kabushiki Kaisha Daini Seikosha: *See—*
Nakagawa, Yasuichi, 4,028,881.
Ueda, Takashi, 4,028,880.

Kabushiki Kaisha Hamai Seisakusho: *See—*
Hamai, Yoshihiko; Hamai, Tatsuro; Tanaka, Yuya; and Nakatani, Akira, 4,029,475.

Kobayashi, Akira, 4,029,070.

Kabushiki Kaishi Komatsu Seisakusho: *See—*
Okano, Toshikatsu, 4,029,188.

Kadowaki, Takashi: *See—*
Denda, Yasuaki; Kadowaki, Takashi; and Dohi, Michio, 4,029,625.

Kaeding, Warren W., to Mobil Oil Corporation. Selective production of para-xylene. 4,029,716, Cl. 260-672.00T.

Kaetsu, Isao: *See—*
Yoshida, Masaru; Okubo, Hiroshi; and Kaetsu, Isao, 4,029,842.

Kah, Carl L. C., Jr. Continuous cycle timer having adjustable day and time periods of operation. 4,029,918, Cl. 200-38.00D.

Kahler, Richard W. Fluid-cooled smoking device. 4,029,109, Cl. 131-173.000.

Kai, Chiharu. Metallic tag. 4,028,833, Cl. 40-316.000.

Kaji, Takeo: *See—*
Fujikawa, Kanichi; Takahashi, Ryohei; Yokomichi, Isao; Kimura, Fumio; Kaji, Takeo; and Sakashita, Nobuyuki, 4,029,490.

Kakalec, Robert John, to Bell Telephone Laboratories, Incorporated. Ferroresonant regulator with supplementary regulatinn through waveform control. 4,030,025, Cl. 323-61.000.

Kalcor Coatings Company, Inc.: *See—*
Carson, Malcolm E.; and Ellslager, William M., 4,029,511.

Kamens, Ernest Rudolph; Kressin, Donald Milton; Lange, Harold Carl; and MacLeay, Ronald Edward, to Pennwalt Corporation. Polymeric cellular structures. 4,029,615, Cl. 260-2.50R.

Kamizono, Tetsushi: *See—*
Yoshiura, Hirohisa; Arai, Toshiharu; Miyake, Masao; Furuya, Yoshikane; Onogi, Seiji; and Kamizono, Tetsushi, 4,029,877.

Kammel, Roland: *See—*
Winterhager, Helmut; Kammel, Roland; and Lucke, Michael, 4,029,302.

Kamstrup-Larsen, Harry, to Leca Trading & Concession A/S. Rotary kiln for producing a bloated clay product. 4,029,464, Cl. 432-118.000.

Kamyr Aktiebolag: *See—*
Jacobsen, Finn; and Gustavsson, Lennart, 4,029,579.

Kaneko, Yuichiro; Teraoka, Fuminori; Kubota, Tatsushi; and Nishikawa, Takehiko, to Kabushiki Kaisha Tokai Rika Denki Seisakusho. Safety belt devices for vehicles. 4,029,339, Cl. 280-745.000.

Kao Soap Co., Ltd.: *See—*
Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, 4,029,608.

Kapanen, Aarne Albin; Rantanen, Raimo Uolevi; Lindroos, Leo Elias; Relander, John Henrik; and Honkala, Risto Johannes, to Outokumpu Oy. Process for smelting and recovery of a material containing noble metals. 4,029,494, Cl. 75-10.00R.

Kaplan, Richard; and Schultz, Jack L., to Grumman Aerospace Corporation. Deployable reflector structure. 4,030,102, Cl. 343-915.000.

Karami, Hamzeh, to Colgate-Palmolive Cnmpany. Tape fastener for disposable diaper. 4,029,098, Cl. 128-284.000.

Karami, Hamzeh, to Colgate-Palmolive Company. Shape retaining diaper. 4,029,100, Cl. 128-284.000.

Kargl, Hans: *See—*
Hafner, Leonhard; Schramm, Wilhelm; Kargl, Hans; and Kieser, Friedrich, 4,029,641.

Karp, Edward C.: *See—*
Foster, Colin E.; and Karp, Edward C., 4,029,161.

Karpenko, Anatole N., to Anchor/Darling Valve Company. In service exercisable tilt disc check valve. 4,029,290, Cl. 251-82.000.

Karrer, Friedrich, to Ciba-Geigy Corporation. Terpene aryl esters. 4,029,649, Cl. 260-240.00H.

Kasch, Helmut: *See—*
Ponsold, Kurt; and Kasch, Helmut, 4,029,648.

Kasuya, Takanori: *See—*
Ban, Itsuki; Kasuya, Takanori; Yano, Kanji; and Maruyama, Kenichi, 4,030,134.

Kennedy, Joseph P., to Exxon Research and Engineering Company. Cationic polymerization catalyst. 4,029,866, Cl. 526-185.000.

Kenney, Clarence E. Variable pitch mounting for airfoil blades of a windmill or propeller. 4,029,434, Cl. 416-41.000.

Kenney, Joseph F., to Remington Arms Company, Inc. Method of forming lead styphnate ammunition priming mixture. 4,029,530, Cl. 149-28.000.

Kent Manufacturing Co. Inc.: *See—*
Blair, Calvin B.; Brinker, Lee J.; and Ankenman, Thomas W., 4,029,155.

Keppeler, Dieter, to Carl Walther, Sportwaffenfabrik. Cocking mechanism for hand firearms. 4,028,836, Cl. 42-69.00B.

Kerb, Ulrich: *See—*
Alig, Leo; Nickolson, Robert; Wiechert, Rudolf; Furst, Andor; Kieslich, Klaus; Muller, Marcel; and Kerb, Ulrich, 4,029,692.
Engelfried, Otto; Kerb, Ulrich; Wiechert, Rudolf; Wachtel, Helmut; Palenschat, Dieter; Horowski, Reinhard; Paschelke, Gert; and Kehr, Wnlfgang, 4,029,777.

Kerber, Charles W. Calibrated leak balloon micro-catheter. 4,029,104, Cl. 128-348.000.

Kernander, Warren N.: *See—*
Van Bennekom, Carl F.; Hyer, Donald R.; and Kernander, Warren N., 4,030,030.

Kerwin, Joseph E.; and Erlandson, Paul M., to Continental Group, Inc., The. Convenience opening of containers for liquid products. 4,029,033, Cl. 113-121.00C.

Kessler, Peter: *See—*
Ursel, Eckhard; and Kessler, Peter, 4,029,259.

Khalifa, Ramzi A.: *See—*
Prather, Joseph E.; and Khalifa, Ramzi A., 4,029,348.

Kienzle, Frank; and Rosen, Perry, to Hoffmann-La Roche Inc. 2-Oxo-2H cyclopenta[b]furans. 4,029,674, Cl. 260-343.30R.

Kieser, Friedrich: *See—*
Hafner, Leonhard; Schramm, Wilhelm; Kargl, Hans; and Kieser, Friedrich, 4,029,641.

Kieslich, Klaus: *See—*
Alig, Leo; Nickolson, Robert; Wiechert, Rudolf; Furst, Andor; Kieslich, Klaus; Muller, Marcel; and Kerb, Ulrich, 4,029,692.

Kiessling, Rudolf H., to Square D Company. Pneumatic timing attachment for an electromagnetic device. 4,030,054, Cl. 335-61.000.

Kihara, Keiichi: *See—*
Hattori, Tatsuo; Katsuragawa, Kanzi; Kihara, Keiichi; Ono, Isao; and Tamabayashi, Hanzo, 4,029,640.

Kikuchi, Masaru: *See—*
Takahashi, Toshiro; Nagano, Toshihiro; Nakamura, Katsuhiko; and Kikuchi, Masaru, 4,028,795.

Kikuyama, Akira; and Ichinose, Kazutoshi, to Ricoh Watch Co., Ltd. High precision timepiece pace measuring device. 4,028,927, Cl. 73-6.000.

Kilbourne, Edwin D., to Mount Sinai School of Medicine of the City University of New York. Influenza vaccine containing purified neuraminidase antigen and method of using the same. 4,029,763, Cl. 424-89.000.

Kilburn, Richard Fleming: *See—*
Apgar, Donald Harlem; and Kilburn, Richard Fleming, 4,029,351.

Killop, James Thomas, to Anderson-Cook, Inc. Apparatus and method for splining power transmission members. 4,028,922, Cl. 72-88.000.

Kim, Heung Tai; and Wilson, Gary F., to B.F. Goodrich Company, The. Extrusion die. 4,029,458, Cl. 425-135.000.

Kiminki, Keijo; Kulmala, Raili; and Sipila, Seppo, to Oy. W. Rosenlew Ab. Acid hydrolysis of polysaccharide-containing raw material. 4,029,515, Cl. 127-37.000.

Kimura, Fumio: *See—*
Fujikawa, Kanichi; Takahashi, Ryohei; Yokomichi, Isao; Kimura, Fumio; Kaji, Takeo; and Sakashita, Nobuyuki, 4,029,490.

Kimura, Shuji, to Nippon Kogaku K.K. Power-operated actuator for a film advance mechanism of a camera. 4,030,111, Cl. 354-173.000.

Kindig, Guilford Edwin; and Adamski, Henry Stanislaus, to Eastman Kodak Company. Pawl and ratchet clutch. 4,029,184, Cl. 192-28.000.

King, John: *See—*
Augstein, Joachim; Cairns, Hugh; Hunter, Dennis; and King, John, 4,029,802.

King Label Company: *See—*
Buck, Homer G., 4,028,783.

King, Larry K.: *See—*
Schoener, Ronald C.; King, Larry K.; Knapp, Lester L.; and Kloap, Nicholas, 4,029,750.

Kingsley, Patrick John, to Fisons Limited. Method for treating gingivitis. 4,029,761, Cl. 424-55.000.

Kinkel, Karl F.: *See—*
Vice, Bobby C., 4,028,810.

Kinoshita, Mitsutaka: *See—*
Nakamura, Hirokazu; Kinoshita, Mitsutaka; and Iwasa, Seizo, 4,028,963.

Kinoshita, Tsutomu: *See—*
Mizukami, Hidekatsu; Fukui, Kosuke; and Kinoshita, Tsutomu, 4,029,404.

Kinugasa, Hiroaki: *See—*
Nishimura, Haruki; Shimizu, Masanao; Hatano, Naonobu; Nakatsuzi, Katsuyoshi; Kinugasa, Hiroaki; and Kon, Hiroko, 4,029,780.

Kirkwood, Philip Robert: *See—*
Clark, Allan; and Kirkwood, Philip Robert, 4,029,934.

Kish, Richard E., to Pitney-Bowes, Inc. Label applicator. 4,029,537, Cl. 156-497.000.

Klaren, Petrus Jozef. Anchor. 4,029,040, Cl. 114-304.000.

Klee, John Michael: *See—*
Wignall, Harry; Shelton, William Ewart Alan; and Klee, John Michael, 4,028,910.

Binder, Horst; Knodler, Reinhard; Kohling, Alfons; and Sandstede, Gerd, 4,029,563.

Knoll, Carl G., to Illinois Tool Works Inc. Electrical terminal constructed to prevent insert molding flash. 4,029,388, Cl. 339-218.00R.

Knopp, Walter V., to A. Johnson & Co. Inc. Brazing alloy compositions. 4,029,476, Cl. 428-676.000.

Knudsen, Jens Nygaard: *See—*
Dideriksen, Erling Thue; and Knudsen, Jens Nygaard, 4,028,844.

Kobayashi, Akira, to Kabushiki Kaisha Toyota Chuo Kenkyusho. Fuel supply system for internal combustion engine. 4,029,070, Cl. 123-139.0AN.

Kobayashi, Isamu; Yamashiro, Osamu; Yashiki, Naoki; and Funakubo, Tadashi, to Hitachi, Ltd. Voltage booster circuit using level shifter composed of two complementary MIS circuits. 4,029,973, Cl. 307-264.000.

Kobayashi, Makio: *See—*
Senjo, Teizo; and Kobayashi, Makio, 4,029,739.

Kobe Steel Ltd.: *See—*
Oishi, Minoru; Okuda, Naoki; Tomita, Makoto; Ohkubo, Nobumasa; Kogane, Kazuo; and Yonezawa, Kazuo, 4,029,933.
Takahashi, Eiji; Shimizu, Masaru; Oki, Yasuhiro; and Ishigami, Osamu, 4,029,524.

Koch, Frederick William, to Lubrizol Corporation, The. Lubricants and functional fluids containing substituted sulfolanes as seal swelling agents. 4,029,587, Cl. 252-48.200.

Koch, Frederick William, to Lubrizol Corporation, The. Substituted sulfolanes as seal swelling agents. 4,029,588, Cl. 252-48.200.

Koda, Yosiharu, to Denkosha Co., Ltd. Watertight means for electric plug-receptacle coupling. 4,029,382, Cl. 339-94.00M.

Koenig, Nathan H.; and Friedman, Mendel, to United States of America, Agriculture. Process for simultaneously flameproofing and shrinkproofing wool. 4,029,471, Cl. 8-128.00R.

Koenig, Ralph A.: *See—*
Hart, Wallace F.; and Koenig, Ralph A., 4,029,146.

Koerner, Gotz: *See—*
Fink, Hans-Ferdi; Koerner, Gotz; and Rossmy, Gerd, 4,029,596.

Koga, Yoshihiko: *See—*
Yamamoto, Hisao; Inukai, Toshiya; and Koga, Yoshibiko, 4,029,798.

Kogane, Kazuo: *See—*
Oishi, Minoru; Okuda, Naoki; Tomita, Makoto; Ohkubo, Nobumasa; Kogane, Kazuo; and Yonezawa, Kazuo, 4,029,933.

Kohler, Werner; and Muller, Willi, to Siemens Aktiengesellschaft. Inductive voltage transformer. 4,030,057, Cl. 336-83.000.

Kohling, Alfons: *See—*
Binder, Horst; Knodler, Reinhard; Kohling, Alfons; and Sandstede, Gerd, 4,029,563.

Kohmoto, Keisuke: *See—*
Noguchi, Teruhisa; Kohmoto, Keisuke; and Kato, Kimpei, 4,029,813.

Kohn, Harold B.: *See—*
Sze, Morgan C.; and Kohn, Harold B., 4,029,474.

Kohnke, Ole Bjorn, to Hesse, Ruth Lea. Gas supply device. 4,029,093, Cl. 128-145.700.

Koiso, Yoichi; Ito, Koji; and Seno, Hiroshi, to Nippon Kayaku Kabushiki Kaisha. Chromium containing azo dyes. 4,029,643, Cl. 260-145.00B.

Koizumi, Toshimichi, to Olympus Optical Co., Ltd. Objective for video disks. 4,029,398, Cl. 350-231.000.

Kollmeyer, Willy D.; Roman, Steven A.; and Soloway, Samuel B., to Shell Oil Company. N-(Arylsulfonyl)-2-nitro-2-(1-methyl-2-(1,3-diazacycloalkylidene)acetamides. 4,029,791, Cl. 424-251.000.

Kolstein, Samuel. Stroller for attachment to a carrying case. 4,029,327, Cl. 280-47.13R.

Komatsu, Tadaaki: *See—*
Yano, Eizi; Ohkawa, Shunjiro; Komatsu, Tadaaki; and Adachi, Masami, 4,029,222.

Kominami, Yasuo: *See—*
Ienaka, Masanori; Kominami, Yasuo; Suzuki, Yukio; and Kawamura, Masami, 4,030,035.

Komiyama, Yosizo: *See—*
Nakamura, Hiromi; Komiyama, Yosizo; Yamashita, Mitsuo; and Ishii, Masaji, 4,029,000.

Kon, Hiroko: *See—*
Nishimura, Haruki; Shimizu, Masanao; Hatano, Naonobu; Nakatsuzi, Katsuyoshi; Kinugasa, Hiroaki; and Kon, Hiroko, 4,029,780.

Kondo, Hiroshi; Murata, Isamu; and Yamanaka, Teruo, to Toyota Jidosha Kogyo Kabushiki Kaisha. Method and device for suppressing noise radio waves in motor vehicle having ignition type engine. 4,029,969, Cl. 307-10.00R.

Konishiroku Photo Industry Co., Ltd.: *See—*
Fujiwhara, Mitsuto; and Sato, Ryosuke, 4,029,503.

Konrad, Joseph D. Surfacing tool. 4,028,781, Cl. 29-78.000.

Konyves, Imre: *See—*
Fex, Hans Jacob; Hogberg, Knut Bertil; and Konyves, Imre, 4,029,778.

Koppel, Gary A., to Eli Lilly and Company. Process for preparing 3-acyloxymethyl-2-cephem compounds. 4,029,651, Cl. 260-243.00C.

Korb, Fritz, to BBC Brown Boveri & Company Limited. Thyristor controlled direct current regulator. 4,030,020, Cl. 321-45.00C.

Korn, Uzi; and Shtrickman, Shmuel, to Yeda Research & Development Co. Ltd. Thermoelectric detector. 4,029,521, Cl. 136-225.000.

Kortenbusch, Werner, to Ruhrkohle AG. Arrangement for hydraulically conveying solids. 4,029,362, Cl. 302-14.000.

Kosiorek, Raymond Stanley, to Hercules Incorporated. Metallizing compositions. 4,029,605, Cl. 252-514.000.

Koslowski, Gerhard: *See—*
Schippers, Heinz; and Koslowski, Gerhard, 4,029,452.

Kosta, Geza, to Midland-Ross Corporation. Web coating apparatus. 4,029,833, Cl. 427-428.000.

Kotala, James R.; and Hamilton, William W., to Westingbouse Electric Corporation. Electrical bus duct with torque indication nut. 4,029,379, Cl. 339-22.00B.

Kotos, Peter, to General Electric Company. Electric circuit breaker with electro-magnetic means for opposing magnetic contact-repulsion forces. 4,030,055, Cl. 335-195.000.

Kotter, James I.; and Folk, Craig L., to United States of America, Agriculture. Method and apparatus for producing yarn from fibrous tufts. 4,028,872, Cl. 57-58.910.

Kotzsch, Hans-Joachim; Seiler, Claus-Dietrich; and Vablensieck, Hans-Joachim, to Dynamit Nobel Aktiengesellschaft. Organophosphonic acids or esters containing an epoxy group. 4,029,679, Cl. 260-348.00R.

Kouvoussis, Anthony E.: *See—*
Bennett, Thomas H.; Carlow, Earl F.; Kouvoussis, Anthony E.; Orgill, Rodney H.; Peddle, Charles; and Wiles, Michael F., 4,030,079.

Kovacs, Ernest; Ludwig, David P.; and Zwickel, Friedich, to Western Electric Company, Inc. Methods of and apparatus for mounting articles to a carrier member. 4,029,536, Cl. 156-285.000.

Koyama, Nobuyuki: *See—*
Nakai, Saburo; and Koyama, Nobuyuki, 4,029,221.

Kozu, Isao: *See—*
Yamada, Kiichiro; Kozu, Isao; Akamine, Takenori; and Shimizu, Ryota, 4,030,133.

Kraftwerk Union Aktiengesellschaft: *See—*
Kuter, Heinrich; and Weghaupt, Erich, 4,029,981.

Krake, Harry. Spool stand. 4,029,241, Cl. 223-106.000.

Kramer, Richard L., to General Motors Corporation. Steering column lock inhibitor. 4,029,168, Cl. 180-114.000.

Kramer, Rolf; and Schneider, Felix, to Eisenbahn-Verkehrsmittel AG. Globe valve construction. 4,029,292, Cl. 251-163.000.

Krantz, Leonard Albert, Jr.; and Fort, Jack Bernard, to Bendix Corporation, The. Connector having a plated plastic ground for filter contacts. 4,029,386, Cl. 339-143.00R.

Kraus, Werner: *See—*
von Bezold, Gotz-Dietrich; and Kraus, Werner, 4,029,091.

Krenzer, John; and Wu, Chin Ching, to Velsicol Chemical Corporation. 1-Benzothiazolyl-5-hydroxyimidazolidinones. 4,029,491, Cl. 71-90.000.

Kressin, Donald Milton: *See—*
Kamens, Ernest Rudolph; Kressin, Donald Milton; Lange, Harold Carl; and MacLeay, Ronald Edward, 4,029,615.

Kresta, Erich, to Semperit Aktiengesellschaft. Tire blank for a vehicle tire with tire bead ply means and improved vehicle tire formed therefrom. 4,029,138, Cl. 152-362.00R.

Krohn, Wolfgang; Metzger, Karl Georg; Preiss, Michael; and Walkowiak, Michael, to Bayer Aktiengesellschaft. Nitro-β-lactam antibiotics and processes for their preparation and use. 4,029,806, Cl. 424-271.000.

Krolick, Arline, executrix: *See—*
Krolick, James J., deceased; and Boshinski, Edwin E., 4,029,162.

Krolick, James J., deceased (by Krolick, Arline, executrix); and Boshinski, Edwin E., to Hobart Corporation. Zero return tare guard. 4,029,162, Cl. 177-165.000.

Krueger, Friedrich; and Michel, Walter, to Joh. A. Benckiser GmbH. N-acyl-1-amino alkane-1,1-diphosphonic acid compounds, process of making same, and compositions for and method of using same. 4,029,697, Cl. 260-502.500.

Kruger, Earl Cameron, Jr.: *See—*
Warner, H. Burt; and Kruger, Earl Cameron, Jr., 4,028,818.

Kruse, Walter M., to ICI United States Inc. Process for preparing mannitol from glucose. 4,029,878, Cl. 536-1.000.

Kubota, Hidetsugu. Plug for internal combustion engine for limiting production of nitrogen oxide. 4,029,982, Cl. 313-11.500.

Kubota, Tatsushi: *See—*
Kaneko, Yuichiro; Teraoka, Fuminori; Kubota, Tatsushi; and Nishikawa, Takehiko, 4,029,339.

Kuby, Milton, to Fairchild Industries Inc. Weapon system. 4,028,991, Cl. 89-41.0ME.

Kuchenmeister, Rolf: *See—*
Dhein, Rolf; Schoeps, Jochen; Beckers, Johannes; and Kuchenmeister, Rolf, 4,029,617.

Kuehnle, Manfred R. Method and means for making helical races. 4,028,992, Cl. 90-11.00C.

Kuhlmann, Joachim: *See—*
Sieber, Paul; and Kuhlmann, Joachim, 4,030,092.

Kuhn, Hans, to Hatebur Umformmaschinen AG. Assembly for applying lubricant to the working area of a punching device. 4,028,918, Cl. 72-45.000.

Kuhn, Wilfried; and Micklausch, Wilfried, to VEB Polygraph Leipzig Kombinat fur Polygraphische Maschinen und Ausrustungeo. Printing machine construction. 4,029,009, Cl. 101-231.000.

Kuhnis, Hans: *See—*
Eichenberger, Kurt; Egli, Christian; Kuhnis, Hans; and Schier, Oswald, 4,029,795.

Alvarez, Robert E.; and Macovski, Albert, 4,029,963.
Lemons, Ross A.; and Quate, Calvin F., 4,028,933.

Lemons, Ross A.; and Quate, Calvin F., to Leland Stanford Junior University, The Board of Trustees of. Acoustic microscope. 4,028,933, Cl. 73-67.600.

Lemper, Anthony L., to Hooker Chemicals & Plastics Corporation. Method of obtaining small particle size polymers and copolymers of vinyl chloride by bulk polymerization. 4,029,863, Cl. 526-88.000.

Leong, Bing M.: *See—*
Iftikar, Syed H.; and Leong, Bing M., 4,030,132.

LeRoy, Pierre L., to New Research and Development Laboratories, Inc. Surgical sponge collector and drainage system. 4,029,097, Cl. 128-276.000.

Lesti, Klaus. Sound and thermal insulating construction element 4,029,839, Cl. 428-306.000.

Lev, Antonin: *See—*
Meinhold, Heinz; Lev, Antonin; and Kunopik, Vlastislav, 4,029,630.

Levens, Joseph A., to Nipak, Inc. Pipe repair apparatus. 4,029,428, Cl. 408-127.000.

Leveque, Rene, to Automobiles Peugeot. Speed variator employing friction having an improved friction elements-tightening device. 4,028,952, Cl. 74-199.000.

Lever Brothers Company: *See—*
Humbert, Francoise Ernestine Lucie; and D'Audiffret, Yves Tollard, 4,029,759.

Levin, Berton P., to Sierracin Corporation, The. Transparent prelaminate with electrical connectors. 4,029,942, Cl. 219-522.000.

Levinson, Armand L.; Heinerichs, Donald W.; and Ruck, George, to Levinson, Armand L. Automatic date-stamping system for vehicles entering parking areas. 4,029,007, Cl. 101-42.000.

Lewis, Elmer: *See—*
Wheeler, Edison L., 4,029,115.

Lewis, Nathanial Henry. Capillary action brake shoe. 4,029,181, Cl. 188-250.00B.

Lewis, Thomas F.: *See—*
Jorgensen, Adam A.; Rose, Norman L.; and Lewis, Thomas F., 4,029,907.

Li, Norman N.; and Cahn, Robert P., to Exxon Research and Engineering Company. Process for removing the salt of a weak acid and a weak base from solution. 4,029,744, Cl. 423-356.000.

Libutti, Bruce L.: *See—*
Godlewski, Irene T.; Schuck, Joseph J.; and Libutti, Bruce L., 4,029,577.

Licentia Patent-Verwaltungs-G.m.b.H.: *See—*
Sieber, Paul; and Kuhlmann, Joachim, 4,030,092.

Licitis, Gunars, to Marvin Glass & Associates. Layered skin doll. 4,028,845, Cl. 46-164.000.

Liebler, Marvin E.; and Lum, Eugene J., to Westinghouse Electric Corporation. Method of assembling helical resistor. 4,028,793, Cl. 29-618.000.

Liebscher, Johannes, to Leifheit International Gunter Leifheit GmbH. Floor or carpet sweeper. 4,028,765, Cl. 15-42.000.

Lies, Thomas Andrew; and Berenson, Herman, to American Cyanamid Company. Tetrahydro-3-(4-pyridylmethyl)-2H-1,3,5-thiadiazine-2-thione. 4,029,652, Cl. 260-243.00R.

Limberg, Allen LeRoy, to RCA Corporation. Feedback amplifiers. 4,030,042, Cl. 330-18.000.

Lin, Jau-Guang. Thin flat eraser and holder. 4,028,771, Cl. 15-434.000.

Lin, Yang-I: *See—*
Fabio, Paul Frank; Lin, Yang-I; Lang, Stanley Albert, Jr.; and Tomcufcik, Andrew Stephen, 4,029,788.

Lincoln Brass Works, Inc.: *See—*
Carlson, Everett W., 4,029,291.

Lindahl, Jonas Arne Ingvar, to Mo och Domsjo. Mechanically freeing wood fibers in the presence of spent peroxide bleaching liquor. 4,029,543, Cl. 162-24.000.

Linde Aktiengesellschaft: *See—*
Reimann, Hans, 4,029,574.

Lindroos, Leo Elias: *See—*
Kapanen, Aarne Albin; Rantanen, Raimo Uolevi; Lindroos, Leo Elias; Relander, John Henrik; and Honkala, Risto Johannes, 4,029,494.

Lingl Corporation: *See—*
Lingl, Hans, Jr., 4,029,198.

Lingl, Hans, Jr., to Lingl Corporation. Method and apparatus for forming groups of bricks. 4,029,198, Cl. 198-425.000.

Lion Fat & Oil Co., Ltd.: *See—*
Isa, Hiroshi; Suzuki, Noboru; Takahashi, Masatoshi; and Hirayama, Eriko, 4,029,606.
Ohbu, Kazuo; Takada, Yuichi; and Nakamura, Shigemi, 4,029,591.

Liu, Gordon Y. T.; Hutchinson, Loyd D.; and Stain, S. Douglas, Jr., to Dow Chemical Company, The. Olefin polymer chlorination products having improved handling properties and process for their preparation. 4,029,862, Cl. 526-43.000.

Loch, Emil P., to Westinghouse Electric Corporation. Method of installing a sleeve in one end of a tube. 4,028,789, Cl. 29-157.400.

Lockheed Missiles & Space Company, Inc.: *See—*
Campbell, Gordon Kieth Colin, 4,030,103.

Lohr, Wilhelm; Berthold, Fritz; and Allington, Robert W. Apparatus for measuring the nuclear radiation of a sequence of radioactive samples. 4,029,961, Cl. 250-328.000.

Long, James F.: *See—*
Sberlock, Margaret H.; and Long, James F., 4,029,815.

Long, Leonard Clarence. Straight action gear changing mechanism. 4,028,959, Cl. 74-473.00R.

Long, Richard William. Diving bell heater and absorbent system. 4,029,483, Cl. 55-68.000.

Longaberger, Robert E. Mold blow out apparatus. 4,029,449, Cl. 425-28.00R.

Lorain Products Corporation: *See—*
Brown, Harold J., 4,030,017.

Loveland, Winton; Hanemann, Horst J.; and Warshaw, Saul, to Loveshaw Corporation, The. Control mechanism for carton sealing machine elevator head. 4,028,865, Cl. 53-76.000.

Loveshaw Corporation, The: *See—*
Loveland, Winton; Hanemann, Horst J.; and Warshaw, Saul, 4,028,865.

Lovrekovic, Steven N.: *See—*
Bechard, Conrad E.; Davenport, John M.; Herrmann, William H., and Lovrekovic, Steven N., 4,028,798.

Lowe, Richard L., to Aluminum Company of America. Flexible junction in a system for fluidizing granular materials. 4,029,363, Cl. 302-29.000.

Lowell Technological Institute Research Foundation: *See—*
Bibl, Klaus; and Reinisch, Bodo W., 4,030,033.

Lowry, Richard P.; Chase, Joseph D.; and Cook, Paul A. C., to Celanese Corporation. Method for reducing molybdenum trioxide content of gases issuing from reactors containing molybdenum-based catalysts. 4,029,636, Cl. 260-530.00N.

Lubrication Company of America: *See—*
Ivey, Herbert D., Jr., 4,029,569.

Lubrizol Corporation, The: *See—*
Koch, Frederick William, 4,029,587.
Koch, Frederick William, 4,029,588.

Luce, David A., to Norlin Music, Inc. Multiplexer for electronic musical instrument. 4,028,979, Cl. 84-1.240.

Lucke, Michael: *See—*
Winterhager, Helmut; Kammel, Roland; and Lucke, Michael, 4,029,302.

Galanos, Chris; Luderitz, Otto; and Westphal, Otto, 4,029,762.

Ludwig, David P.: *See—*
Kovacs, Ernest; Ludwig, David P.; and Zwickel, Friedich, 4,029,536.

Luerken, Adolf. Convertible beach attire. 4,028,740, Cl. 2-67.000.

Lum, Eugene J.: *See—*
Liebler, Marvin E.; and Lum, Eugene J., 4,028,793.

Lumme, Edgar, to Aug. Winkhaus. Locking arrangement with burglar alarm. 4,029,919, Cl. 200-52.00R.

Lummus Company, The: *See—*
Sze, Morgan C.; and Kohn, Harold B., 4,029,474.

Lundquist, Jerry R.: *See—*
Barlow, Malcolm; and Lundquist, Jerry R., 4,029,541.

Lundqvist, Harald. Shelving structure. 4,029,025, Cl. 108-108.000.

Lundwall, Carl, to Lawrence Peska Associates, Inc., a part interest. Distribution system for vermin control composition. 4,028,841, Cl. 43-124.000.

Lutkemeyer-Hohmann, Margitta: *See—*
Diehl, Reiner; and Lutkemeyer-Hohmann, Margitta, 4,030,062.

Lynch, Thomas; and Leiter, Larry L., to Xerox Corporation. Set transport and stacker. 4,029,309, Cl. 270-53.000.

M.H. Canjar Company: *See—*
Canjar, Mathew H., 4,028,835.

Maag, Fritjof; Unger, Friedrich; and Mohr, Wilhelm, to Hoechst Aktiengesellschaft. Roving and process for its manufacture. 4,028,874, Cl. 57-144.000.

Maaghul, John, to PPG Industries, Inc. Glass fiber sizing compositions for the reinforcement of resin matrices. 4,029,623, Cl. 260-29.6RW.

Mabrouk, Saied Abd-Elrahman, to Addressograph Multigraph Corporation. Moisture control system. 4,029,008, Cl. 101-148.000.

MacGregor, John James: *See—*
Westwood, Walter; MacGregor, John James; and Payne, John Blunden, 4,029,499.

Machenschalk, Rudolf: *See—*
Bildstein, Hubert; Machenschalk, Rudolf; and Petter, Helmut, 4,029,828.

Machon, Jean Pierre: *See—*
Gloriod, Pierre; and Machon, Jean Pierre, 4,029,875.

MacLeay, Ronald Edward: *See—*
Kamens, Ernest Rudolph; Kressin, Donald Milton, Lange, Harold Carl, and MacLeay, Ronald Edward, 4,029,615.

MacMillan, Kenneth T. Retreading mold with nonplowing matrices closing. 4,029,447, Cl. 425-21.000.

MacMillan, Kenneth T. Bead aligner wheels with projection for retreading machines. 4,029,448, Cl. 425-21.000.

Macovski, Albert: *See—*
Alvarez, Robert E.; and Macovski, Albert, 4,029,963.

Macy, Frank D.; Hawthorne, Harold E.; and Norton, Harold L. Food dryer. 4,028,816, Cl. 34-195.000.

Macda, Keijiro, to Sony Corporation. Pickup arm assembly 4,029,322, Cl. 274-37.000.

Maev, Veniamin Evnovich: *See—*
Genshpring, Eduard Matveevich; Bljumshtein, Zigmund Genrikhovich; Maev, Veniamin Evnovich; Bondarenko, Fedor Alexeevich; Gutman, Anatoly Lvovich; and Presman, Vladimir Alexandrnvich, 4,029,041.

Maglificio Biellese Fratelli Fila S.p.A.: *See—*
Rolando, Pierluigi, 4,028,744.

Magnetic Controls Company: *See—*
Gunderson, Richard A., 4,029,913.

Magnuson, Allen H. Stabilization and motion alleviation of air cushion borne vehicles. 4,029,036, Cl. 114-67.00A

Maier, Hermann: *See—*
Nagel, Peter; Grau, Werner; Maier, Hermann; Wittkamp, Heinrich; Falk, Roland; and Willmann, Paul, 4,029,249.

Maier, Karl; Graser, Fritz; and Meyer, Guenter, to BASF Aktiengesellschaft. Transfer dyes. 4,029,468, Cl. 8-2.50A.

Maigret, Andre: *See—*
Lachaussee, Maurice; and Maigret, Andre, 4,029,015.

Mainiero, Michael R., to Man Barrier Corporation. Apparatus and method for forming barbed tape. 4,028,925, Cl. 72-294.000.

Mallyclad Corporation: *See—*
Dalbec, Peter M., 4,028,856.

Malmstrom, Sven Erik. Games racket. 4,029,317, Cl. 273-73.00C.

Richter, Charles W., to United States of America, Interior. Method and apparatus for manipulating line weight in an image. 4,029,410, Cl. 355-52.000.

Ricoh Watch Co., Ltd.: *See—*
Kikuyama, Akira; and Ichinose, Kazutoshi, 4,028,927.

Ridgway, Robert W.: *See—*
Chang, Shu-Pei; and Ridgway, Robert W., 4,029,627.

Riecker, Johann Georg, to Hartung, Kuhn & Co. Maschinenfabrik GmbH. Suction arrangement for withdrawing contaminated gases emitted from incandescent coke pushed out from a coking oven. 4,029,551, Cl. 202-263.000.

Rieth, Egon: *See—*
Barenyi, Bela; Haselmann, Heinrich; and Rieth, Egon, 4,029,353.

Rietveld, Frank P., to Colt Industries Operating Corporation. Electrical discharge machining device for cutting with wire electrode. 4,029,929, Cl. 219-69.00W.

Rieve, Robert W.; and Shalit, Harold, to Atlantic Richfield Company. Preparation of ethyl benzene. 4,029,715, Cl. 260-668.00D.

Riffe, Delmar R.; Olson, Richard D.; Edison, David M.; and Spreadbury, Robert J., to Westinghouse Electric Corporation. Inductive coupler. 4,030,058, Cl. 336-92.000.

Riken Keikinzoku Kogyo Kabushiki Kaishi: *See—*
Takahashi, Toshiro; Nagano, Toshihiro; Nakamura, Katsuhiko; and Kikuchi, Masaru, 4,028,795.

Rios, Augusto. Automatically rockable infant's crib. 4,028,753, Cl. 5-108.000.

Risse, Roger Paul Pierre, to Societe Lyonnaise des Applications Catalytiques. Catalyst system for catalytic heaters. 4,029,602, Cl. 252-458.000.

Ritchie, Dale A.; Petroff, Walker G.; and Smarr, Roy G., Jr., to Quattlebaum, Augustus E. Anti-theft alarm system. 4,030,087, Cl. 340-261.000.

Ritchie, Leon Thomas; and Harwood, Robert George, to AMP Incorporated. Laminated connector. 4,028,794, Cl. 29-629.000.

Ritter, Milton P.: *See—*
Warhol, John G.; and Ritter, Milton P., 4,029,532.

Ritzerfeld, Gerhard. Copier with means for handling components of form letters, and the like. 4,029,413, Cl. 355-75.000.

Ritzmann, Horst: *See—*
Ahrens, Norbert; Klockenbusch, Heinrich; Ritzmann, Horst; Klein, Hans; Balzau, Gerhard; and Schnuckel, Clemens, 4,029,365.

Roach, Don T.: *See—*
Cook, Ralph M., deceased; Cook, Ruth Nelson, Personal Representative of the Estate; and Roach, Don T., 4,029,134.

Robaglia, Michele: *See—*
Faugeras, Pierre; Miquel, Pierre; and Robaglia, Michele, 4,029,733.

Robbins, Clarence R.: *See—*
Carson, John C., Jr.; Hall, Robert T.; Kenkare, Divaker B.; and Robbins, Clarence R., 4,029,236.

Robert Bosch G.m.b.H.: *See—*
Hafele, Walter; and Kleeberger, Rudolf, 4,029,069.
Mayer, Siegfried; Sauer, Ivan; and Zorn, Jurgen, 4,029,446.
Ursel, Eckhard; and Kessler, Peter, 4,029,259.

Roberts, Izora M. Collapsible receptacle type stand for use in transporting loaded grocery bags. 4,029,244, Cl. 224-42.42R.

Roberts, Roland W.; and Sochacky, Michael R., Jr., to Robicon Corporation. Arc furnace control system. 4,029,888, Cl. 13-13.000.

Robertshaw Controls Company: *See—*
Sliger, Boyd Paul, 4,029,074.

Robertson, Robert: *See—*
Denny, Patrick John; and Robertson, Robert, 4,029,603.

Robicon Corporation: *See—*
Roberts, Roland W.; and Sochacky, Michael R., Jr., 4,029,888.

Rochester Instrument Systems, Inc.: *See—*
Chana, Maghar S.; and Garelick, Eli Leonard, 4,030,014.

Rockwell International Corporation: *See—*
Ervin, Guy, Jr., 4,029,740.
Evans, Gregory W.; and Caswell, Robert L., 4,029,947.
Keith, John L., 4,030,023.

Rodney Hunt Company: *See—*
Whipps, George E., 4,028,896.

Rodriguez, Henry. Method and apparatus for opinion surveys. 4,029,943, Cl. 235-57.000.

Rodway, William George: *See—*
Brown, Michael Trevenen; and Rodway, William George, 4,029,870.

Roger, Michel Robert, to Societe Anonyme de Telecommunications. Double-wall cryostat having electrical connections. 4,029,893, Cl. 174-15.0CA.

Rogers Corporation: *See—*
Guglielmi, Anthony C., 4,029,377.

Roggero, Arnaldo: *See—*
Priola, Aldo; Roggero, Arnaldo; and Cesca, Sebastiano, 4,029,871.

Rohm, Gunter Horst. Chuck with radially adjustable jaws. 4,029,325, Cl. 279-123.000.

Rohm and Haas Company: *See—*
Hurt, William S., 4,029,774.
Piccolini, Richard J., 4,029,702.

Rohner, Michel Alexandre: *See—*
Florence, Judit Katalin; and Rohner, Michel Alexandre, 4,030,077.

Rohr Industries, Inc.: *See—*
Blair, Winford; and Schwartz, Melvin M., 4,029,254.
Parker, Elmo G., 4,029,479.

Rokach, Joshua: *See—*
Hunter, Norman R.; Rooney, Clarence S.; Rokach, Joshua; and Cragoe, Edward J., Jr., 4,029,803.

Rolando, Pierluigi, to Maglificio Biellese Fratelli Fila S.p.A. Jacket of knitted jersey fabric. 4,028,744, Cl. 2-108.000.

Roldan, Cristobal Martinez: *See—*
Cartes, Juan Bosch; Cabiro, Jorge Canals; Jarque, Ricardo Granados; Roldan, Cristobal Martinez; and Peinado, Fernando Rabadan, 4,029,799.

Roll-Rite Corporation: *See—*
Christensen, Carl O., 4,029,333.

Rollei-Werke Franke & Heidecke: *See—*
Albrecht, Hermann Friedrich, 4,029,407.

Roman, Steven A.: *See—*
Kollmeyer, Willy D.; Roman, Steven A.; and Soloway, Samuel B., 4,029,791.

Romanelli, Antonio. Pipe fittings. 4,029,345, Cl. 285-334.200.

Roof, James L.: *See—*
Fox, David A.; and Roof, James L., 4,029,972.

Rookus, James E. Sharpeners for electric shavers. 4,028,799, Cl. 30-37.000.

Rooney, Clarence S.: *See—*
Hunter, Norman R.; Rooney, Clarence S.; Rokach, Joshua; and Cragoe, Edward J., Jr., 4,029,803.

Roper Corporation: *See—*
Austin, Buddy Julian, 4,029,926.

Rose, Norman L.: *See—*
Jorgensen, Adam A.; Rose, Norman L.; and Lewis, Thomas F., 4,029,907.

Rosen, Harold A.: *See—*
Bell, H. Clark, Jr.; and Rosen, Harold A., 4,029,902.

Rosen, Perry: *See—*
Kienzle, Frank; and Rosen, Perry, 4,029,674.

Rosen, Ralph S.: *See—*
Bennett, James C., 4,028,975.

Rosencwaig, Allan, to Hoffman-La Roche Inc. Photo acoustic cell. 4,028,932, Cl. 73-67.200.

Rosewicz, Horst; and Klein, Werner, to Furnier- und Sperrholzwerk Werzalit-Pressholzwerk J. F. Werz Jr. KG. Four-way pallet. 4,029,023, Cl. 108-51.100.

Rosnowski, Wojciech, to RCA Corporation. Method of selectively doping a semiconductor body. 4,029,528, Cl. 148-187.000.

Ross, Daniel Louis; and Gavrilovic, Dragan Milan, to RCA Corporation. Novel liquid crystal compounds and electro-optic devices incorporating them. 4,029,595, Cl. 252-299.000.

Ross, Daniel Louis: *See—*
Gavrilovic, Dragan Milan; and Ross, Daniel Louis, 4,029,594.

Rossi, Enzo; Fattori, Silvano; and Imparato, Luigi, to Snam Progetti, S.p.A. Lubricating compositions inhibited against oxidation by addition thereto of 3-azo-6a-thio-thiophthenes or 3,4-diazo-6a-thio-thiophthenes. 4,029,586, Cl. 252-47.500.

Rossmy, Gerd: *See—*
Fink, Hans-Ferdi; Koerner, Gotz; and Rossmy, Gerd, 4,029,596.

Roth, Shirley H.: *See—*
Coffman, Charles L.; Kellerhals, Glen F.; Newcombe, Jack; and Roth, Shirley H., 4,029,570.

Rottermann, Marcel: *See—*
Rottermann, Robert; and Rottermann, Marcel, 4,029,133.

Rottermann, Robert; and Rottermann, Marcel, to Gericke AG, Maschinenfabrik. Process for mechanically emptying powdery substances into a container, and device for carrying out the process. 4,029,133, Cl. 141-12.000.

Roubinet, Pierre: *See—*
Goupy, Marcel; and Roubinet, Pierre, 4,029,350.

Rowe, Edward A., Jr.; and Cawley, William H., to Diamond Shamrock Corporation. Solvent phosphatizing compositions yielding non water soluble coatings. 4,029,523, Cl. 148-6.170.

Rubenstein, Robert Aron, to Addressograph Multigraph Corporation. Method and device for recording copier usage data. 4,029,414, Cl. 355-112.000.

Rubinstein, Herbert J.; and Gilcrest, James D., to Nuclear Services Corporation. Stacked racks for storing spent nuclear fuel elements. 4,029,968, Cl. 250-507.000.

Rubisch, Ottmar: *See—*
Brandmair, Franz; Rubisch, Ottmar; and Honig, Dietmar, 4,029,566.

Ruck, George: *See—*
Levinson, Armand L.; Heinerichs, Donald W.; and Ruck, George, 4,029,007.

Ruegg, Eugen H., to General Electric Company. Overdrive protection circuit for power line carrier systems and the like. 4,030,034, Cl. 325-319.000.

Ruf, Wolfgang: *See—*
Bestenreiner, Friedrich; Helburger, Josef; and Ruf, Wolfgang, 4,030,106.

Rug Crafters: *See—*
Houghton, George L.; and Fredensberg, Fred F., 4,028,802.

Ruhrkohle AG: *See—*
Kortenbusch, Werner, 4,029,362.

Runciman, Herbert Morrison, to Barr and Stroud Limited. Radiation scanning system. 4,029,389, Cl. 350-7.000.

Runyan, Paul S., Jr. Cambered skateboard provided with longitudinally adjustable truck assemblies. 4,029,330, Cl. 280-87.04A.

Russell, Robert G. Control system for electrically conductive liquid heating apparatus. 4,029,937, Cl. 219-295.000.

Rustad, Stanley C.: *See—*
Davis, Noel; Dreier, William M.; and Rustad, Stanley C., 4,028,847.

Rutt, Truman C., to NL Industries, Inc. Dielectric ceramic matrices with end barriers. 4,030,004, Cl. 361-313.000.

Rutten, Donald E.; and Davis, Richard A., to P & D Manufacturing Co., Inc. Bottom grain unloader. 4,029,219, Cl. 214-17.0DA.

Ryeczek, John Joseph. Optoelectronic sound amplifier system for musical instruments. 4,028,977, Cl. 84-1.160.

S.A.E.S. Getters S.p.A.: *See—*
Zucchinelli, Mario, 4,029,987.

Saele, Arvid Harlan; and Hutton, Michael Pier, to Deere & Company. Lockable container spout closure. 4,028,914, Cl. 70-165.000.

Sagami Chemical Research Center: *See—*
Tsuchihashi, Genichi; and Ogura, Katsuyuki, 4,029,712.

Sagara, Hideo; Nishio, Yasuhiro; Wada, Hirokazu; and Hiromoto, Yoshinori, to Mitsubishi Jukogyo Kabushiki Kaisha. Welding torch for underwater welding. 4,029,930, Cl. 219-74.000.

Sager, Fred A. Free-wheeling spindle adaptor. 4,029,423, Cl. 403-3.000.

Sai, Fumio: *See—*
Murata, Moriyasu; Sai, Fumio; and Fujino, Takashi, 4,029,608.

Saito, Atsushi; and Shimada, Minoru, to Yanmar Diesel Engine Co., Ltd. Fuel injection pump for diesel engines. 4,029,071, Cl. 123-139.0AS.

Saitou, Sinichi, to Olympus Optical Co., Ltd. Dual cassette tape recorder. 4,030,135, Cl. 360-94.000.

Sakaguchi, Takumi; and Yamamoto, Toshifumi, to Showa Manufacturing Co., Ltd. Shock absorber for bumpers. 4,029,304, Cl. 267-64.00R.

Sakaguchi, Takumi; and Yamamoto, Toshifumi, to Showa Manufacturing Co., Ltd. Shock absorber for bumpers. 4,029,306, Cl. 267-116.000.

Sakariason, Douglas M., to Pako Corporation. Strip feeding mechanism. 4,029,247, Cl. 226-43.000.

Sakashita, Nobuyuki: *See—*
Fujikawa, Kanichi; Takahashi, Ryohei; Yokomichi, Isao; Kimura, Fumio; Kaji, Takeo; and Sakashita, Nobuyuki, 4,029,490.

Sakurada, Nobuaki; Shinoda, Nobuhiko; Mashimo, Yukio; Ito, Tadashi; and Ito, Fumio, to Canon Kabushiki Kaisha. Digital exposure meter. 4,029,421, Cl. 356-223.000.

Salem, Robert J., to General Electric Company. Battery voltage detection and warning means. 4,030,086, Cl. 340-249.000.

Salerno, Charles M.: *See—*
Schubert, Dale W.; and Salerno, Charles M., 4,029,305.

Salerno, Michael T., to Raymond Lee Organization, Inc., The, a part interest. Sliding door safety device. 4,028,772, Cl. 16-86.00A.

Salmi, Pekka; and Raunio, Pentti, to Oy Tampella AB. Hydraulic striking apparatus. 4,028,995, Cl. 91-276.000.

Saltzman, William H., to Intellectual Property Development Corporation. Antimicrobial compositions. 4,029,775, Cl. 424-238.000.

Salzer, Roman, to Interliz Anstalt. Device for loading air with a controllable amount of a granular or powdery material. 4,029,364, Cl. 302-34.000.

Samoray, Werner: *See—*
Weidanz, Herbert; Sandt, Gerhard; and Samoray, Werner, 4,029,540.

Samour, Carlos M., to Kendall Company, The. Monomeric morpholinium emulsion stabilizers. 4,029,658, Cl. 260-247.10E.

Sanchez, Edward J. Musical apparatus. 4,028,984, Cl. 84-422.00R.

Sandoz Ltd.: *See—*
Avar, Lajos; and Hofer, Kurt, 4,029,684.

Sandstede, Gerd: *See—*
Binder, Horst; Knodler, Reinhard; Kohling, Alfons; and Sandstede, Gerd, 4,029,563.

Sandt, Gerhard: *See—*
Weidanz, Herbert; Sandt, Gerhard; and Samoray, Werner, 4,029,540.

Sanitary Scale Company: *See—*
Foster, Colin E.; and Karp, Edward C., 4,029,161.

Sanko Co., Ltd.: *See—*
Urakami, Fukashi, 4,029,164.

Sanno, Yasushi: *See—*
Murata, Tadakazu; Nohara, Akira; Sugihara, Hirosada; and Sanno, Yasushi, 4,029,699.

Sansui Electric Co., Ltd.: *See—*
Kusano, Kazutoshi, 4,030,036.
Takahashi, Shinobu, 4,029,906.

Sarges, Reinhard, to Pfizer Inc. Aminophenyltetralin compounds. 4,029,731, Cl. 424-316.000.

Sasaki, Rokuro: *See—*
Tanaka, Minoru; Mitani, Shoichi; Yuminaka, Takeo; Sasaki, Rokuro; and Nakamura, Hatuya, 4,030,037.

Sasaki, Toshihiko, to Honeywell Inc. Analog isolator. 4,030,041, Cl. 330-10.000.

Sase, Hisashi, to Toho Plastics Co., Ltd.; and Mitsubishi Pencil Co., Ltd. Pipe organ. 4,028,982, Cl. 84-331.000.

Sata, Shoichi; and Ikezoe, Yasumasa, to Japan Atomic Energy Research Institute. Process for producing hydrogen and oxygen. 4,029,754, Cl. 423-579.000.

Sato, Chuichi: *See—*
Inoue, Gentei; Sato, Chuichi; Tanaka, Mamoru; and Matsuo, Nobuhiro, 4,029,323.

Sato, Kozi: *See—*
Ishii, Kiyoshi; and Sato, Kozi, 4,029,582.

Sato, Ryosuke: *See—*
Fujiwhara, Mitsuto; and Sato, Ryosuke, 4,029,503.

Satoh, Kazuhisa. Regular eight face polyhedral antenna element. 4,030,101, Cl. 343-872.000.

Saucy, Gabriel: *See—*
Chan, Ka-Kong; and Saucy, Gabriel, 4,029,678.

Sauer, Ivan: *See—*
Mayer, Siegfried; Sauer, Ivan; and Zorn, Jurgen, 4,029,446.
Sawada, Daisaku: *See—*
Goto, Kenji; and Sawada, Daisaku, 4,029,072.
Say, Donald L., to GTE Sylvania Incorporated. CRT in-line electron gun assembly. 4,029,988, Cl. 313-414.000.
Sayigh, Adnan A. R.; Sun, Kwok K.; and Ulrich, Henri, to Upjohn Company, The. Purification process for MDA. 4,029,705, Cl. 260-570.00D.
Scarborough, Grover Harry, to AMP Incorporated. Re-enterable splice case. 4,029,895, Cl. 174-138.00F.
Schaefer, Roland: *See—*
Gross, Albert; and Schaefer, Roland, 4,029,632.
Schafer, Augustin; and Mogg, Klaus, to Zinser Textilmaschinen GmbH. Spinning machine with automatic service carriage. 4,028,869, Cl. 57-34.00R.
Schafers, Heinrich B. Dowel. 4,028,988, Cl. 85-87.000.
Schapel, Dietmar; and von Gizycki, Ulrich, to Bayer Aktiengesellschaft. Mixed polyols. 4,029,593, Cl. 252-182.000.
Schaub, Wolfgang: *See—*
Effland, Richard C.; Davis, Larry; and Schaub, Wolfgang, 4,029,672.
Schcib, William R.; and Schuetz, James W., to Aetna-Standard Engineering Company. Plug and shoe changing in piercing and reeling mills. 4,028,923, Cl. 72-97.000.
Schelk, Roger E.: *See—*
Feurstein, Ludwig J.; Meives, Otis E.; and Schelk, Roger E., 4,029,194.
Schering Aktiengesellschaft: *See—*
Engelfried, Otto; Kerb, Ulrich; Wiechert, Rudolf; Wachtel, Helmut; Palenschat, Dieter; Horowski, Reinhard; Paschelke, Gert; and Kehr, Wolfgang, 4,029,777.
Petzoldt, Karl; and Elger, Walter, 4,029,779.
Schering Corporation: *See—*
Sherlock, Margaret H.; and Long, James F., 4,029,815.
Wright, John J., 4,029,882.
Schertz, William W.; and Zwerdling, Solomon, to United States of America, Energy Research and Development Administration. Solar collector having a solid transmission medium. 4,029,519, Cl. 136-89.0PC.
SCHIAPPARELLI - Stabilimenti Chimici Farmaceutici Riuniti S.p.A.: *See—*
Tamagnone, Gian Franco; and De Marchi, Franco, 4,029,811.
Schick, Rupert: *See—*
Nintz, Eckhard; Schick, Rupert; Seegmueller, Karl; and Stahnecker, Erhard, 4,029,614.
Schier, Oswald: *See—*
Eichenberger, Kurt; Egli, Christian; Kuhnis, Hans; and Schier, Oswald, 4,029,795.
Schippers, Heinz; and Koslowski, Gerhard, to Barmag Barmer Maschinenfabrik Aktiengesellschaft. Apparatus for calibrating an extruded thermoplastic tube. 4,029,452, Cl. 425-71.000.
Schlafer, Ludwig: *See—*
Meininger, Fritz; and Schlafer, Ludwig, 4,029,644.
Schlage, Ernest L., to Schlage Lock Company. Key retaining cylinder for a lock. 4,028,917, Cl. 70-389.000.
Schlage Lock Company: *See—*
Schlage, Ernest L., 4,028,917.
Schlegel, Brooke Pershing: *See—*
Secrist, George Richard; Berls, Richard Warren; and Schlegel, Brooke Pershing, 4,029,504.
Schlosser, Paul W., to Bleiweiss, Edward. High pressure piston pump and wiper, sealing, valving structure. 4,029,442, Cl. 417-489.000.
Schlueter, William L.: *See—*
Courson, Thomas G.; Schlueter, William L.; and Kelly, Thomas T., 4,028,902.
Schlumberger Technolgy Corporation: *See—*
Elliott, Jennings W., 4,030,064.
Schmidt, Felix Helmut: *See—*
Weber, Helmut; Aumuller, Walter; Muth, Karl; Weyer, Rudi; and Schmidt, Felix Helmut, 4,029,666.
Schmidt, Gary M.; Gabor, Robert J.; and Venaleck, John T., to A P Products Incorporated. Multiple switch mechanism. 4,029,914, Cl. 200-1.00R.
Schmidt, Georg: *See—*
Dorr, Karl-Heinz; Grimm, Hugo; Weber, Waldemar; Tacke, Michael; and Schmidt, Georg, 4,029,751.
Schmidt, Herbert; Herzel, Joachim; and Zickler, Dietrich, to Zimmer Plastic GmbH. Apparatus for introducing starting materials into a shearing gap of a machine for production of flat structures. 4,029,455, Cl. 425-142.000.
Schmidt, Herbert J.: *See—*
Benedict, Andrew G.; Marker, Thomas E.; and Schmidt, Herbert J., 4,029,214.
Schmidt, Lawrence R., to General Electric Company. Injection molding process. 4,029,841, Cl. 428-325.000.
Schmidt, Paul Herman: *See—*
Andres, Klaus; and Schmidt, Paul Herman, 4,028,905.
Schmiedeke, Jurgen, to Gunther Papenmeier KG, Maschinen-und Apparatebau. Method and apparatus for manufacture of granulates from pulverulent, granular, dougby or similar material. 4,029,459, Cl. 425-202.000.
Schmitt, Joseph Lawrence, Jr.; Walker, Philip Leroy, Jr.; and Castellion, George Augustus, to American Cyanamid Company. Carbon particulates with controlled density. 4,029,600, Cl. 252-444.000.
Schmitz, Reinold: *See—*
Gehrke, Gunter; and Schmitz, Reinold, 4,029,680.
Schmuck, Frederic E.: *See—*
Schoepe, Adolf; and Schmuck, Frederic E., 4,028,748.
Schneck, Richard, to Sulzer Morat GmbH. Fabric take-up mechanism. 4,028,912, Cl. 66-149.00R.
Schneider, Felix: *See—*
Kramer, Rolf; and Schneider, Felix, 4,029,292.
Schnuckel, Clemens: *See—*
Ahrens, Norbert; Klockenbusch, Heinrich; Ritzmann, Horst; Klein, Hans; Balzau, Gerhard; and Schnuckel, Clemens, 4,029,365.
Schobel, Alfred; and Schobel, Wilhelm. Clamping ring and closure means. 4,028,777, Cl. 24-16.0PB.
Schobel, Wilhelm: *See—*
Schobel, Alfred; and Schobel, Wilhelm, 4,028,777.
Schoener, Ronald C.; King, Larry K.; Knapp, Lester L.; and Kloap, Nicholas, to Aluminum Company of America. Solid particulate lobular $AlCl_3$. 4,029,750, Cl. 423-495.000.
Schoepe, Adolf; and Schmuck, Frederic E. Valve seat of a flush valve used in flush tanks and the like. 4,028,748, Cl. 4-52.000.
Schoeps, Jochen: *See—*
Dhein, Rolf; Schoeps, Jochen; Beckers, Johannes; and Kuchenmeister, Rolf, 4,029,617.
Schoettle, Klaus; Wittkamp, Heinrich; Gliniorz, Lothar; and Dobler, Peter, to BASF Aktiengesellschaft. Tape recorder and magnetic tape cassette. 4,029,268, Cl. 242-198.000.
Scholz, I. Hartmut. Device for providing rugs and the like with tufts. 4,029,031, Cl. 112-80.000.
Schramm, Wilhelm: *See—*
Hafner, Leonhard; Schramm, Wilhelm; Kargl, Hans; and Kieser, Friedrich, 4,029,641.
Schroeder, Herman E., to Du Pont de Nemours, E. I., and Company. Cordless vehicle tire. 4,029,730, Cl. 264-315.000.
Schubert, Dale W.; and Salerno, Charles M., to Barry Wright Corporation. Pneumatic vibration isolator and suspension system. 4,029,305, Cl. 267-65.00R.
Schuck, Joseph J.: *See—*
Godlewski, Irene T.; Schuck, Joseph J.; and Libutti, Bruce L., 4,029,577.
Schuermann, Kenneth W.; and Slaton, Vernon C., III, to Charles Machine Works, Inc., The. Single lever control for actuating control valves and the like. 4,028,958, Cl. 74-471.0XY.
Schuetz, James W.: *See—*
Scheib, William R.; and Schuetz, James W., 4,028,923.
Schulte, Wilfried: *See—*
Bender, Werner; Bergner, Dieter; Hannesen, Kurt; Hund, Helmut; and Schulte, Wilfried, 4,029,565.
Schultz, Everett M.: *See—*
Cragoe, Edward J., Jr.; and Schultz, Everett M., 4,029,816.
Schultz, Frederick K., to General Motors Corporation. Instrument panel illumination dimming control. 4,029,991, Cl. 315-135.000.
Schultz, Jack L.: *See—*
Kaplan, Richard; and Schultz, Jack L., 4,030,102.
Schulz, Gunter; and Igel, Wolfgang, to Zinser Textilmaschinen GmbH. Ring spinning or twisting machine. 4,028,873, Cl. 57-124.000.
Schuman, Paul D.; Westmoreland, Geraldine; and Anderson, Roy, to PCR, Inc. Process for producing 5-fluorouracil and derivatives thereof in acid and/or alcohol solvents. 4,029,661, Cl. 260-256.40C.
Schumann, Paul A., Jr.; and Tong, Alvin H., to International Business Machines Corporation. Textile color analyzer calibration. 4,029,419, Cl. 356-173.000.
Schuurman, Pieter J., to Shell Oil Company. Waste heat boiler. 4,029,054, Cl. 122-7.00R.
Schwartz, Melvin M.: *See—*
Blair, Winford; and Schwartz, Melvin M., 4,029,254.
Schwartz, Norman L., to Multiplex Communications, Inc. Time delay control circuit. 4,030,010, Cl. 318-487.000.
Schwartz, Rene: *See—*
Aubry, Pierre; Marques, Antoine; and Schwartz, Rene, 4,029,437.
Schwartz, Robert. Crozat appliance and method of manufacturing same. 4,028,808, Cl. 32-14.00E.
Schwarzkopf Development Corporation: *See—*
Bildstein, Hubert; Machenschalk, Rudolf; and Petter, Helmut, 4,029,828.
Schwede, Franz-Josef; and Valentin, Ingo, to Hydromatic GmbH. Bearing supporting a swashplate of a hydraulic axial cylinder machine. 4,029,367, Cl. 308-2.00R.
Schweitzer, Ronald D., to Tappan Company, The. Igniter assembly. 4,029,936, Cl. 219-267.000.
Scialpi, Leonard Joseph: *See—*
Emodi, Alexander S.; Newmark, Harold Leon; and Scialpi, Leonard Joseph, 4,029,805.
SCM Corporation: *See—*
Eaton, John Littell, Jr.; Brill, Richard Henry; and Myers, Walter E., 4,029,940.
McGinniss, Vincent Daniel, 4,029,561.
Scott, Anthony I.: *See—*
Heiser, Richard S.; and Scott, Anthony I., 4,029,255.
Scrocco, Joseph: *See—*
Cottingham, Hugh; and Scrocco, Joseph, 4,029,959.
Cottingham, Hugh V.; and Scrocco, Joseph, 4,029,418.
Seaberg, David H., to J. I. Case Company. Linkage support system for material handling unit. 4,029,226, Cl. 214-139.000.
Seanor, Donald A.: *See—*
Imperial, George R.; and Seanor, Donald A., 4,029,827.
Searfoss, George H., Jr. Nail driving tool. 4,029,135, Cl. 145-46.000.

Secrist, George Richard; Berls, Richard Warren; and Schlegel, Brooke Pershing, to Eastman Kodak Company. Photographic image transfer elements containing neutralizing layers comprising particulate materials. 4,029,504, Cl. 96-29.00D.
Seegmueller, Karl: *See—*
Nintz, Eckhard; Schick, Rupert; Seegmueller, Karl; and Stahnecker, Erhard, 4,029,614.
Seiler, Claus-Dietrich: *See—*
Kotzsch, Hans-Joachim; Seiler, Claus-Dietrich; and Vahlensieck, Hans-Joachim, 4,029,679.
Seiler, Erhard; Fahrbach, Gerhard; and Stein, Dieter, to Badische Anilin- & Soda-Fabrik Aktiengesellschaft. Block or graft copolymers of polyalkylene oxides and vinylaromatic or diene polymers. 4,029,720, Cl. 260-887.000.
Seitz, Paul L.; and Gabel, Robert K., to Nalco Chemical Company. Linear surfactant polymers formed from substituted amines and difunctional reactants. 4,029,708, Cl. 260-584.00B.
Sekiya, Setsuro: *See—*
Noguchi, Masaaki; Tanaka, Yukiyasu; Sekiya, Setsuro; and Motosugi, Katsuhiko, 4,029,062.
Noguchi, Masaaki; Tanaka, Yukiyasu; Sekiya, Setsuro; and Motosugi, Katsuhiko, 4,029,075.
Selwood, Alan: *See—*
Cannon, Cyril George; and Selwood, Alan, 4,029,535.
Semperit Aktiengesellschaft: *See—*
Kresta, Erich, 4,029,138.
Senjo, Teizo; and Kobayashi, Makio, to Fuji Kasui Engineering Co., Ltd.; and Sumitomo Metal Industries, Ltd. Process for removing nitrogen oxides from waste gas. 4,029,739, Cl. 423-235.000.
Seno, Hiroshi: *See—*
Koiso, Yoichi; Ito, Koji; and Seno, Hiroshi, 4,029,643.
Seo, Ryozo: *See—*
Gerstine, Milton I.; Futatsugi, Setsuo; Ueda, Kazuo; Seo, Ryozo; Iwasaki, Koji; and Uemura, Makoto, 4,029,946.
Sermem S.A.: *See—*
Fischer, Lorenz, 4,029,441.
Servicemaster Industries Inc.: *See—*
Hufton, Austen B., 4,028,827.
Shah, Jaykumar Jivraj; Porsche, Jules Downes; and Bartell, Charles, to Borden, Inc. Polymeric release agents. 4,029,843, Cl. 428-352.000.
Shah, Jitendra N.: *See—*
George, Harvey F.; Shah, Jitendra N.; and Oppenheimer, Robert H., 4,029,013.
Shah, Sunil C., to Leesona Corporation. Film granulator. 4,028,779, Cl. 241-73.000.
Shalit, Harold: *See—*
Rieve, Robert W.; and Shalit, Harold, 4,029,715.
Shannon, Edward L.: *See—*
Bone, David P.; and Shannon, Edward L., 4,029,823.
Sharp, Herbert John; Drucker, Rudolf; Droar, Edward; and Ali Zaidi, Syed Mujahid, to GKN Sankey Limited. Method of injection moulding pallets. 4,029,728, Cl. 264-278.000.
Sharp Kabushiki Kaisha: *See—*
Matsutani, Toshinobu; and Nishida, Keiichi, 4,029,518.
Tagawa, Takao, 4,030,107.
Sharples, Thomas Davy, to Beckman Instruments, Inc. Vestibule valve reagent dispenser. 4,029,473, Cl. 23-259.000.
Shaver, J. Lyle, to Allis-Chalmers Corporation. Self-raising bin loading auger for combines. 4,029,228, Cl. 214-522.000.
Shaw, John B. Open cycle solar energy system utilizing buoyancy as a conversion force. 4,028,893, Cl. 60-641.000.
Shawn, Nelson G.; Gabrio, Anthony L.; and Gabrio, Iris G-S. Match book. 4,029,203, Cl. 206-108.000.
Sheldon, Allen. Layering knife assembly. 4,028,806, Cl. 30-290.000.
Shell Oil Company: *See—*
Kollmeyer, Willy D.; Roman, Steven A.; and Soloway, Samuel B., 4,029,791.
Pegels, Abraham A., 4,029,599.
Schuurman, Pieter J., 4,029,054.
Shelton, William Ewart Alan: *See—*
Wignall, Harry; Shelton, William Ewart Alan; and Klee, John Michael, 4,028,910.
Shenker, Martin, to Farrand Optical Co., Inc. Lens system for modifying spherical aberration. 4,029,396, Cl. 350-188.000.
Sherlock, Margaret H.; and Long, James F., to Schering Corporation. Anti-diarrheal anthranilic acids. 4,029,815, Cl. 424-309.000.
Shiba, Keisuke: *See—*
Tanaka, Mitsugu; Arai, Atsuaki; Nakazyo, Kiyoshi; and Shiba, Keisuke, 4,029,508.
Shikinami, Yasuo; Iida, Kosuke; Hata, Kunihiro; and Fujii, Tetsuya, to Takiron Co., Ltd. Synthetic leather. 4,029,840, Cl. 428-310.000.
Shimada, Minoru: *See—*
Saito, Atsushi; and Shimada, Minoru, 4,029,071.
Shimizu, James K.; and Basil, Richard V., Jr., to Hughes Aircraft Company. N-section microwave resonator having rotary joint for variable coupling. 4,030,051, Cl. 333-83.00R.
Shimizu, Masanao: *See—*
Nishimura, Haruki; Shimizu, Masanao; Hatano, Naonobu; Nakatsuzi, Katsuyoshi; Kinugasa, Hiroaki; and Kon, Hiroko, 4,029,780.
Shimizu, Masaru: *See—*

White, Lawrence Samuel: *See—*
Mlodozeniec, Arthur Roman; and White, Lawrence Samuel, 4,029,757.

White, Rowland Kent. Automatic cancellation means for vehicle turn indicator signals. 4,030,066, Cl. 340-73.000.

White's Electronics, Inc.: *See—*
Payne, George Calvin, 4,030,026.

Whitlock, William E., to Lase Industries. Pulse code modulated digital audio system. 4,030,129, Cl. 360-32.000.

Widenhofer, James W., to Sparton Corporation. Sonobuoy retainer plate. 4,029,233, Cl. 220-89.00A.

Wiechel, John F.: *See—*
DeWitt, David P.; Hannemann, Robert E.; and Wiechel, John F., 4,029,085.

Wiechert, Rudolf: *See—*
Alig, Leo; Nickolson, Robert; Wiechert, Rudolf; Furst, Andor; Kieslich, Klaus; Muller, Marcel; and Kerb, Ulrich, 4,029,692.
Engelfried, Otto; Kerb, Ulrich; Wiechert, Rudolf; Wachtel, Helmut; Palenschat, Dieter; Horowski, Reinhard; Paschelke, Gert; and Kehr, Wolfgang, 4,029,777.

Wieczorek, Leonard, to Coors Porcelain Company. Resilient heat resistant laminated composite. 4,029,836, Cl. 428-246.000.

Wiedemann, Fritz; Thiel, Max; Stach, Kurt; Dietmann, Karl; and Sponer, Gisbert, to Boehringer Mannheim G.m.b.H. N-substituted 1-amino-3-phenoxy-propan-2-ol compounds and therapeutic compositions containing them. 4,029,783, Cl. 424-247.000.

Wien, Raymond E.: *See—*
Cotton, John F.; Hanks, Jack G.; and Wien, Raymond E., 4,030,053.

Wiese, Herbert K., to Exson Research and Engineering Company. Novel oligomerization catalysts and their preparation. 4,029,601, Cl. 252-447.000.

Wignall, Harry; Shelton, William Ewart Alan; and Klee, John Michael, to Bentley Engineering Company, Ltd., The. Tubular knitted fabric. 4,028,910, Cl. 66-26.000.

Wilcox, Roger V.: *See—*
Daniel, Donald D.; and Wilcox, Roger V., 4,030,038.

Wilde, Donald M.: *See—*
Sweda, Adam D.; and Wilde, Donald M., 4,029,349.

Wiles, Michael F.: *See—*
Bennett, Thomas H.; Carlow, Earl F.; Kouvoussis, Anthony E.; Orgill, Rodney H.; Peddle, Charles; and Wiles, Michael F., 4,030,079.

Wilhelmsen, Irven R. Truck body tail gate. 4,029,355, Cl. 296-57.00R.

Wilkins, Judd R.; and Mills, Stacey M., to United States of America, National Aeronautics and Space Administration. Automated single-slide staining device. 4,029,470, Cl. 8-94.110.

Wilkinson, Albert Edward Roy; and Candler, Nigel Dane Quartano, to Tollemache Environmental Engineers Limited. Ballistic pulveriser separator. 4,029,263, Cl. 241-188.00R.

Will Ross, Inc.: *See—*
Faust, Robert C., 4,029,105.

Willard, John W., Sr., to CAW Industries, Inc. Method of therapeutically treating damaged and/or infected tissue and relieving stress and shock in warm blooded animals. 4,029,770, Cl. 424-127.000.

Wille, Mark E. Trolling ski. 4,028,840, Cl. 43-43.130.

Williams, Albert L.; and Heiba, El-Ahmadi I., to Mobil Oil Corporation. Process for preparation of lactone-esters. 4,029,675, Cl. 260-343.600.

Williams, Edward B., Jr.: *See—*
Lara, Jose Hector; and Williams, Edward B., Jr., 4,029,986.

Williams, Malcolm: *See—*
Jones, Christopher Robin; Williams, Malcolm; and Adey, Anthony John, 4,029,068.

Willmann, Paul: *See—*
Nagel, Peter; Grau, Werner; Maier, Hermann; Wittkamp, Heinrich; Falk, Roland; and Willmann, Paul, 4,029,249.

Wilms, Gerard J. M.; and Joosten, Hendrik C. J., to Bata Shoe Company, Inc. Apparatus for lasting footwear uppers. 4,028,764, Cl. 12-1.00W.

Wilson, Gary F.: *See—*
Kim, Heung Tai; and Wilson, Gary F., 4,029,458.

Wilson, Robert Neil, to Illinois Tool Works Inc. Self-drilling screws. 4,028,987, Cl. 85-46.000.

Wiltrout, Dale E., to Allen Group Inc., The. Back filter automatic vehicle wash water reclaim system. 4,029,114, Cl. 134-104.000.

Winegardner, W. Kevin: *See—*
Postma, Arlin Keith; and Winegardner, W. Kevin, 4,029,482.

Wingard Limited: *See—*
Slipper, John Richard, 4,029,267.

Winicki, Bernard, to Union Chimique Continentale - U.C.C. Societe Anonyme. Device for regulating perfusion flowrate. 4,029,094, Cl. 128-214.00F.

Winkler, Charles L., to Westinghouse Electric Corporation. Elevator system. 4,029,175, Cl. 187-29.00R.

Winn, Martin, to Abbott Laboratories. 8-Aralkyl-1,4-ethano-5H-[1]benzopyrano[3,4-b]pyridines. 4,029,665, Cl. 260-293.530.

Winstel, Frank H., to Auto-Heat, Inc. Apparatus for recovery of heat from exhaust gases of dryer. 4,028,817, Cl. 34-86.000.

Winterhager, Helmut; Kammel, Roland; and Lucke, Michael, to Kloeckner-Humboldt-Deutz AG. Device for separation of mistures of at

least partially molten metals and/or metallic compounds into at least two phases of different density. 4,029,302, Cl. 266-204.000.
Wirt, Leon A., to Caterpillar Tractor Co. Boom-stick adapter for two-piece boom. 4,029,225, Cl. 214-138.00R.
Wise, Lester V.: *See—*
Neill, Jimmie D.; and Wise, Lester V., 4,029,341.
Wittel, Hermann, to Siemens Aktiengesellschaft. Surge voltage arrester arrangement. 4,029,997, Cl. 361-129.000.
Wittkamp, Heinrich: *See—*
Nagel, Peter; Grau, Werner; Maier, Hermann; Wittkamp, Heinrich; Falk, Roland; and Willmann, Paul, 4,029,249.
Schoettle, Klaus; Wittkamp, Heinrich; Gliniorz, Lothar; and Dobler, Peter, 4,029,268.
Woessner, Warren Dexter; Biddlecom, William Gerard; Arndt, Henry Clifford; Peruzzotti, George Peter; and Sih, Charles John, to Miles Laboratories, Inc. Cycloalkylidenol analogues of prostaglandins E and F. 4,029,698, Cl. 260-514.00D.
Wolstenholme, Harold, to Mather & Platt Limited. Viners. 4,028,867, Cl. 56-12.800.
Wonn, James W.: *See—*
Hurwitz, Michael J.; and Wonn, James W., 4,029,395.
Wood, Kenneth L. Carburetor. 4,029,065, Cl. 123-122.0AA.
Wood, Prentice J., to Mead Corporation, The. Article carrier. 4,029,205, Cl. 206-173.000.
Woodruff, Robert L. Adjustable stable camera support for vehicles. 4,029,246, Cl. 224-42.45B.
Woods, Jack L.: *See—*
Pittman, Tobe A.; and Woods, Jack L., 4,029,568.
Woodville Rubber Company Limited: *See—*
Broadhurst, Jeffrey Charles, 4,029,272.
Wortmann, Joachim: *See—*
Vollmer, Hartfrid; Dany, Franz-Josef; Wortmann, Joachim; and Munch, Peter, 4,029,721.
Wovcha, Merle G.: *See—*
Antosz, Frederick J.; Haak, Willard J.; and Wovcha, Merle G., 4,029,549.
Wright, Cecil Edward. Rack and pinion steering unit. 4,028,957, Cl. 74-422.000.
Wright, Forrest S. Exercising device. 4,029,312, Cl. 272-123.000.
Wright, George W., to Crown Cork & Seal Company, Inc. Apparatus for inspecting containers. 4,029,958, Cl. 250-223.00B.
Wright, Harold A.: *See—*
Ingram, Alvin R.; and Wright, Harold A., 4,029,869.
Wright, Harold E.; and Donatelli, Lee A. Miniature trimmer with flexible plastic base. 4,030,003, Cl. 361-293.000.
Wright, John G.: *See—*
Burnside, Chester C.; and Wright, John G., 4,029,443.
Wright, John J., to Schering Corporation. Selective acylation of the C-1 amino group of aminoglycoside antibiotics. 4,029,882, Cl. 536-17.000.
Wu, An-Chuan. Biological tissue strengthening device. 4,029,088, Cl. 128-38.000.
Wu, Celia. Corner hook frame. 4,028,832, Cl. 40-155.000.
Wu, Chin Ching: *See—*
Krenzer, John; and Wu, Cbin Ching, 4,029,491.
Wurfel, Wolfgang. Alarm system. 4,030,089, Cl. 340-274.00R.
Wurlitzer Company, The: *See—*
Hill, Robert S.; and Herwig, Lewis F., 4,028,980.
Wuttke, Gilbert H.: *See—*
Henderson, Timothy M.; and Wuttke, Gilbert H., 4,028,941.
Xerox Corporation: *See—*
Bell, George E., 4,029,047.
Bjornsson, Eyjolf Steuart, 4,030,072.
Goffe, William L., 4,029,502.
Imperial, George R.; and Seanor, Donald A., 4,029,827.
Jones, Glen D.; and Raffetto, Michael J., 4,029,373.
Lynch, Thomas; and Leiter, Larry L., 4,029,309.
Neukermans, Armand P., 4,030,105.
Pond, Stephen F., 4,030,104.
Ragen, Robert A.; and Herendeen, Carl E., 4,029,190.
Spinelli, Richard A.; and Allis, Robert F., 4,029,409.
Stemmle, Denis J., 4,029,411.
Xodar Corporation: *See—*
Clough, Roy L., Jr.; and Snow, John F., 4,029,581.
Yamada, Kiichiro; Kozu, Isao; Akamine, Takenori; and Shimizu, Ryota, to Matsushita Electric Industrial Co., Ltd. Guide drum apparatus for a video tape recorder and/or player. 4,030,133, Cl. 360-84.000.
Yamada, Siyouhachi; and Nakatsubo, Reigi, to Stanley Electric Co., Ltd. Card and card reader apparatus therefor. 4,029,945, Cl. 235-61.12N.
Yamada, Takeo; Ando, Seigo; and Watanabe, Katsujiro, to Nippon Kokan Kabushiki Kaisha. Apparatus for non-contact measurement of distance from a metallic body using a detection coil in the feedback circuit of an amplifier. 4,030,027, Cl. 324-34.00D.
Yamagishi, Masaaki: *See—*
Aya, Masahiro; Miyamoto, Masao; Fukazawa, Nobuo; and Yamagishi, Masaaki, 4,029,646.
Yamagishi, Shigeharu. Device for plugging a hollow of a concrete pile. 4,029,128, Cl. 138-89.000.
Yamamoto, Hisao; Inukai, Toshiya; and Koga, Yoshihiko, to Sumitomo Chemical Company, Limited. Analgetic composition. 4,029,798, Cl. 424-260.000.
Yamamoto, Rikichi, to Toshiba Kikai Kabushiki Kaisha. Molding machine. 4,029,457, Cl. 425-167.000.
Yamamoto, Shuji; Isshiki, Setsuya; and Igarashi, Mitsuru, to Fujikura Cable Works, Ltd., The. Method of manufacturing insulated electric power cables. 4,029,830, Cl. 427-57.000.
Yamamoto, Toshifumi: *See—*
Sakaguchi, Takumi; and Yamamoto, Toshifumi, 4,029,304.
Sakaguchi, Takumi; and Yamamoto, Toshifumi, 4,029,306.
Yamanaka, Teruo: *See—*
Kondo, Hiroshi; Murata, Isamu; and Yamanaka, Teruo, 4,029,969.
Yamashiro, Osamu: *See—*
Kobayashi, Isamu; Yamashiro, Osamu; Yashiki, Naoki; and Funakubo, Tadashi, 4,029,973.
Yamashita, Mitsuo: *See—*
Nakamura, Hiromi; Komiyama, Yosizo; Yamashita, Mitsuo; and Ishii, Masaji, 4,029,000.
Yamashita, Nobuo, to Olympus Optical Co., Ltd. Retrofocus-type wide-angle photographic lens system. 4,029,397, Cl. 350-214.000.
Yamazaki, Noriaki: *See—*
Nakano, Keita; Horie, Kiyoshi; and Yamazaki, Noriaki, 4,029,826.
Yang, Julie C.: *See—*
Jaunarajs, Karlis L.; and Yang, Julie C., 4,029,512.
Yang, Shu S.: *See—*
Dorn, Conrad P.; and Yang, Shu S., 4,029,772.
Yanmar Diesel Engine Co., Ltd.: *See—*
Saito, Atsushi; and Shimada, Minoru, 4,029,071.
Yano, Eizi; Ohkawa, Shunjiro; Komatsu, Tadaaki; and Adachi, Masami, to Bridgestone Tire Company Limited. Apparatus for loading sheet material on a plurality of shelves on a book truck. 4,029,222, Cl. 214-41.00R.
Yano, Kanji: *See—*
Ban, Itsuki; Kasuya, Takanori; Yano, Kanji; and Maruyama, Kenichi, 4,030,134.
Yashiki, Naoki: *See—*
Kobayashi, Isamu; Yamashiro, Osamu; Yashiki, Naoki; and Funakubo, Tadashi, 4,029,973.
Yasui, Yoshiharu: *See—*
Kawasumi, Nobumitsu; Muramatsu, Shigeru; Suzuki, Mamoru; and Yasui, Yoshiharu, 4,028,870.
Yazaki, Mutsunobu; Uchiyama, Takashi; Matsuda, Mutsuhide; Taguchi, Tetsuya; and Mashimo, Yukio, to Canon Kabushiki Kaisha. Aperture setting device for camera. 4,030,108, Cl. 354-27.000.
Yeda Research & Development Co. Ltd.: *See—*
Korn, Uzi; and Shtrickman, Shmuel, 4,029,521.
Sollish, Bruce D., 4,028,934.
Yoda, Ryuichiro: *See—*
Mitsui, Shigeo; Araki, Tomiyasu; Niikawa, Kazuhiko; Hosoda, Hideo; Jyo, Yoshio; Yoda, Ryuichiro; Suzuki, Giichi; Iijima, Takasi; Tanaka, Hiroshi; Ochiai, Yasutaka; and Ise, Takashi, 4,029,550.
Yokomichi, Isao: *See—*
Fujikawa, Kanichi; Takahashi, Ryohei; Yokomichi, Isao; Kimura, Fumio; Kaji, Takeo; and Sakashita, Nobuyuki, 4,029,490.
Yoneyoshi, Yukio: *See—*
Aratani, Tadatoshi; Nakamura, Shuzo; Nagase, Tsuneyuki; and Yoneyoshi, Yukio, 4,029,683.
Aratani, Tadatoshi; Nakamura, Shuzo; Nagase, Tsuneyuki; and Yoneyoshi, Yukio, 4,029,690.
Yonezawa, Kazuo: *See—*
Oishi, Minoru; Okuda, Naoki; Tomita, Makoto; Ohkubo, Nobumasa; Kogane, Kazuo; and Yonezawa, Kazuo, 4,029,933.
Yonkers, Edward H., to Joslyn Mfg. and Supply Co. Grounded surface distribution apparatus. 4,029,380, Cl. 339-60.00R.
Yorkshire Imperial Metals Limited: *See—*
Jackson, Kenneth Thomas; and Porter, Lance, 4,028,785.
Yoshida, Masaru; Okubo, Hiroshi; and Kaetsu, Isao, to Japan Atomic Energy Research Institute. Transparent coated resin composite. 4,029,842, Cl. 428-334.000.
Yoshida, Mikio: *See—*
Iwata, Hiroshi; and Yoshida, Mikio, 4,029,835.
Yoshida, Minoru: *See—*
Morishima, Yukimasha; Yoshida, Minoru; and Hanaki, Kimiyasu, 4,029,300.
Yoshida, Tadamasa: *See—*
Ishii, Ko; and Yoshida, Tadamasa, 4,029,850.
Yoshinaka, Shigeo; Doya, Masaharu; Uchiyama, Seiiji; and Nozaki, Sadao, to Mitsubishi Gas Chemical Company, Inc. Process for producing $\alpha,\alpha,\alpha,\alpha',o',\alpha'$-hexachloroxylene. 4,029,560, Cl. 204-163.00R.
Yoshioka, Kouichi: *See—*
Hiraga, Kentaro; Okutani, Tetsuya; Yoshioka, Kouichi; and Asako, Tsunehiko, 4,029,883.
Yoshiura, Hirohisa; Arai, Toshiharu; Miyake, Masao; Furuya, Yoshikane; Onogi, Seiji; and Kamizono, Tetsushi, to Mitsubishi Chemical Industries Ltd. Process for preparing polyolefin. 4,029,877, Cl. 528-483.000.
Young, Clifford Kenneth. Raker claw hammer. 4,028,757, Cl. 7-8.10R.
Young, Edwin Harry Paterson, to Imperial Chemical Industries Limited. Morpholine derivatives for treating depression. 4,029,786, Cl. 424-248.560.
Yu, Jing-Peir; and Gilmer, Donald G., to Monsanto Company. False-twist texturing process. 4,028,875, Cl. 57-157.0TS.
Yuminaka, Takeo: *See—*
Tanaka, Minoru; Mitani, Shoichi; Yuminaka, Takeo; Sasaki, Rokuro; and Nakamura, Hatuya, 4,030,037.
Yurtin, John A.: *See—*
Nestor, Charles R.; and Yurtin, John A., 4,029,374.
Zahnradfabrik Friedrichshafen AG: *See—*
Jablonsky, Erich, 4,028,996.

Jablonsky, Erich, 4,028,998.
Keller, Manfred; and Elser, Dieter, 4,029,124.
Lang, Armin, 4,028,997.
Zaidan Hojin Biseibutsu Kagaku Kenkyu Kai: *See—*
Umezawa, Hamao; Aoyagi, Takaaki; Takeuchi, Tomio; Hamada, Masa; and Okami, Yoshiro, 4,029,547.
Zander, Georg, to U.S. Philips Corporation. Apparatus for high speed winding of coils. 4,028,920, Cl. 72-66.000.
Zappe, Hans H., to International Business Machines Corporation. Low-crosstalk-automatic resetting scheme for Josephson junction logic circuit. 4,029,975, Cl. 307-306.000.
Zehrung, Claude D., Jr., to Bluebird International, Inc. Towable lawn comber. 4,028,868, Cl. 56-17.200.
Zemek, Albert W.; Holmes, Robert H.; and Merithew, David L., to Universal Instruments Corporation. Non-axial lead electrical component prepper-taper apparatus. 4,029,131, Cl. 140-105.000.
Zerobnick, Alan H.; and Cole, David J., to Zerobnick, Samuel. Integrated belt-supported backpack. 4,029,243, Cl. 224-8.00R.
Zerobnick, Samuel: *See—*
Zerobnick, Alan H.; and Cole, David J., 4,029,243.
Zickler, Dietrich: *See—*
Schmidt, Herbert; Herzel, Joachim; and Zickler, Dietrich, 4,029,455.
Ziegel, Liliane: *See—*
Ziegel, Olivier; and Ziegel, Liliane, 4,029,370.
Ziegel, Olivier; and Ziegel, Liliane. Portable safe. 4,029,370, Cl. 312-284.000.
Ziegenhagen, Allyn J.; and Campbell, Ramsey G., to Stauffer Chemical Company. Ethylene/chlorine elimination process. 4,029,714, Cl. 260-658.00R.
Zielie, Richard C., to Caterpillar Tractor Co. Mounting bracket for tubular members. 4,029,276, Cl. 248-74.00R.
Zimmer Plastic GmbH: *See—*
Schmidt, Herbert; Herzel, Joachim; and Zickler, Dietrich, 4,029,455.
Zimmerman, Dennis M.; and Marshall, Winston S., to Eli Lilly and Company. Novel N-cycloalkylmethyl decahydroisoquinolincs for producing opiate-like analgesia. 4,029,796, Cl. 424-258.000.
Zinser Textilmaschinen GmbH: *See—*
Schafer, Augustin; and Mogg, Klaus, 4,028,869.
Schulz, Gunter; and Igel, Wolfgang, 4,028,873.
Zorn, Jurgen: *See—*
Mayer, Siegfried; Sauer, Ivan; and Zorn, Jurgen, 4,029,446.
Zucchinelli, Mario, to S.A.E.S. Getters S.p.A. Wide channel getter device. 4,029,987, Cl. 313-174.000.
Zwerdling, Solomon: *See—*
Schertz, William W.; and Zwerdling, Solomon, 4,029,519.
Zwickel, Friedich: *See—*
Kovacs, Ernest; Ludwig, David P.; and Zwickel, Friedich, 4,029,536.

LIST OF REISSUE PATENTEES

TO WHOM

PATENTS WERE ISSUED ON THE 14TH DAY OF JUNE, 1977

NOTE.—Arranged in accordance with the first significant character or word of the name (in accordance with city and telephone directory practice).

Ex-Cell-O Corporation: *See—*
Hendry, James W., Re. 29,265.

Hendry, James W., to Ex-Cell-O Corporation. Closed cell foam plastic molding machine. Re. 29,265, Cl. 425-147.000.

Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased (by Sparks, Helen W., administratrix); and Powers, Walter H., to S-C Liquidating Corporation. Motor controlled lamp. Re. 29,266, Cl. 240-61.900.

Hoerner Waldorf Corporation: *See—*
Roccaforte, Harry I., Re. 29,263.

Manning, Richard P.: *See—*
Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased; and Powers, Walter H., Re. 29,266.

Powers, Walter H.: *See—*
Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased; and Powers, Walter H., Re. 29,266.

Roccaforte, Harry I., to Hoerner Waldorf Corporation. Protective carton. Re. 29,263, Cl. 229-39.00B.

S-C Liquidating Corporation: *See—*
Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased; and Powers, Walter H., Re. 29,266.

Sparks, Harry G., deceased: *See—*
Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased; and Powers, Walter H., Re. 29,266.

Sparks, Helen W., administratrix: *See—*
Hessemer, Lawrence E.; Manning, Richard P.; Sparks, Harry G., deceased; and Powers, Walter H., Re. 29,266.

Svein Stromberg & Co. A/S: *See—*
Utz, Georg, Re. 29,262.

Thornber, Bernice B.: *See—*
Woodward, Frederick W., Re. 29,264.

Thornber, Donald: *See—*
Woodward, Frederick W., Re. 29,264.

Utz, Georg, to Svein Stromberg & Co. A/S. Arrangement pertaining to a case for bottles, boxes or other standardized articles. Re. 29,262, Cl. 220-21.000.

Woodward, Frederick W., to Thornber, Donald; and Thornber, Bernice B. Tent for rear-doored vehicle. Re. 29,264, Cl. 296-23.0MC.

LIST OF PLANT PATENTEES

Beakbane, A. Beryl, to National Seed Development Organisation Limited. Plum rootstock—Pixy variety. 4,061, 6-14-77, Cl. 38.000.

National Seed Development Organisation Limited: *See—*
Beakbane, A. Beryl, 4,061.
Tydeman, Henry M., deceased; Tydeman, Elizabeth Mary, executrix; and Tydeman, William Marcus, executor, 4,059.

Stark Brothers Nurseries and Orchards Co.: *See—*
Tuttle, Roy, 4,060.

Tuttle, Roy, to Stark Brothers Nurseries and Orchards Co. Apple tree—mutation of Scarlet Staymared. 4,060, 6-14-77, Cl. 34.000.

Tydeman, Elizabeth Mary, executrix: *See—*
Tydeman, Henry M., deceased; Tydeman, Elizabeth Mary, executrix; and Tydeman, William Marcus, executor, 4,059.

Tydeman, Henry M., deceased; by Tydeman, Elizabeth Mary, executrix; and by Tydeman, William Marcus, executor, to National Seed Development Organisation Limited. Cherry rootstock—Colt variety. 4,059, 6-14-77, Cl. 37.000.

Tydeman, William Marcus, executor: *See—*
Tydeman, Henry M., deceased; Tydeman, Elizabeth Mary, executrix; and Tydeman, William Marcus, executor, 4,059.

LIST OF DESIGN PATENTEES

Air-Lock Plastics, Inc.: *See—*
Talmon, Floyd H.; and Talmon, David K., 244,645.

Allibert Exploitation, Societe Anonyme: *See—*
Vrignaud, Guy, 244,660.

American Optical Corporation: *See—*
Armbruster, John T., 244,711.

American Sign and Advertising Services, Inc.: *See—*
Niehaus, Donald H.; Schwab, Nick J.; and Seggerson, Patrick J., 244,725.

Amerock Corporation: *See—*
Tegner, Raymond U. H., 244,652.
Tegner, Raymond U. H., 244,653.
Tegner, Raymond U. H., 244,654.
Tegner, Raymond U. H., 244,668.

Anderson, Lloyd H.: *See—*
Deaton, Charles U.; and Anderson, Lloyd H., 244,643.
Deaton, Charles U.; and Anderson, Lloyd H., 244,649.

Ansul Company, The: *See—*
Montambo, Roger Jay, 244,702.

Armbruster, John T., to American Optical Corporation. Cabinet for a water bath shaker. 244,711, 6-14-77, Cl. D24-38.000.

Asahi Kogaku Kogyo Kabushiki Kaisha: *See—*
Tsugami, Naoya, 244,687.

Babb, Burton A., to Babbco, Ltd. Loudspeaker cone. 244,698, 6-14-77, Cl. D14-37.000.

Babbco, Ltd.: *See—*
Babb, Burton A., 244,698.

Null, Philip L., 244,650.

Null, Philip L., to Null Manufacturing Corporation. Convertible bench. 244,644, 6-14-77, Cl. D6-36.000.

Null, Philip L., to Null Manufacturing Corporation. Seat. 244,650, 6-14-77, Cl. D6-68.000.

Offredi, Giovanni, to Fratelli Saporiti Industria Arredamenti Di Saporiti, Sergio E Giorgio S.N.C. Armchair. 244,647, 6-14-77, Cl. D6-56.000.

Okamoto, Shinobu, to Kowa Company Ltd. Tape recorder. 244,699, 6-14-77, Cl. D14-6.000.

Ort, Wolfgang: *See—*
Hansen, David E.; and Ort, Wolfgang, 244,685.

Outerbridge, Robert D. Masthead flagstaff. 244,679, 6-14-77, Cl. D11-181.000.

Panorama Radio & Electronics Corporation: *See—*
Emmerling, Ronald, 244,718.

Pulos, Arthur J.; Cridland, Michael; and Moro, Joseph, to Dictaphone Corporation. Remote control microphone or similar article. 244,700, 6-14-77, Cl. D14-12.000.

Rabinowitz, Harold, to Dart Industries Inc. Insulated tote bag. 244,723, 6-14-77, Cl. D87-1.00R.

Rajaniemi, Brunhild B.: *See—*
Rajaniemi, Raymond U.; and Rajaniemi, Brunhild B., 244,641.

Rajaniemi, Raymond U.; and Rajaniemi, Brunhild B. Foot warmer. 244,641, 6-14-77, Cl. D2-264.000.

Reckjunior Cosmetic GmbH & Co. KG: *See—*
Kohl, Ingeborg, 244,721.

Ripple, Warren. Speaker enclosure. 244,696, 6-14-77, Cl. D14-30.000.

Ross, Charles R., to C.R. Engineering, Inc. Headlamp housing. 244,714, 6-14-77, Cl. D48-32.00R.

Ryder, Francis E.: *See—*
Thomas, Michael D.; and Ryder, Francis E., 244,719.

Ryder International Corporation: *See—*
Thomas, Michael D.; and Ryder, Francis E., 244,719.

Sano, Hiroshi. Toy crane. 244,709, 6-14-77, Cl. D34-15.00S.

Schimanski, Georg, to Globol-Werk GmbH. Air freshener or similar article. 244,692, 6-14-77, Cl. D23-150.000.

Schneider, Florian; and Hutter, Ralf. Electronic percussion musical instrument. 244,717, 6-14-77, Cl. D56-1.00E.

Schoepe, Adolf. Ball cock float. 244,693, 6-14-77, Cl. D23-33.000.

Schwab, Nick J.: *See—*
Niehaus, Donald H.; Schwab, Nick J.; and Seggerson, Patrick J., 244,725.

Seggerson, Patrick J.: *See—*
Niehaus, Donald H.; Schwab, Nick J.; and Seggerson, Patrick J., 244,725.

Sheeley, Eugene L.: *See—*
Guzzle, Timothy L.; and Sheeley, Eugene L., 244,703.

Shell International Petroleum Company Limited: *See—*
Monnet, Claude Alain Richard, 244,664.

Shiffman, Jerome. Jewelry box. 244,669, 6-14-77, Cl. D9-235.000.

Smyrni, Emmanuel S.; and White, Bobbie L., to Gym-Dandy, Inc. Combined slide and swing support or the like. 244,704, 6-14-77, Cl. D34-5.00M.

Sunbeam Corporation: *See—*
Bluestein, Bernard B., 244,722.
Bluestein, Bernard B., 244,724.

Sutcliffe Engineering Holdings Limited, The: *See—*
Yates, Victor Horace, 244,708.

Swain, Jeanne M. Convertible chair. 244,648, 6-14-77, Cl. D6-64.000.

Syracuse China Corporation: *See—*
Luce, James W., 244,662.

Talmon, David K.: *See—*
Talmon, Floyd H.; and Talmon, David K., 244,645.

Talmon, Floyd H.; and Talmon, David K., to Air-Lock Plastics, Inc. Blow molded plastic seat. 244,645, 6-14-77, Cl. D6-48.000.

Tegner, Raymond U. H., to Amerock Corporation. Pedestal for bathroom fixtures or the like. 244,652, 6-14-77, Cl. D6-86.000.

Tegner, Raymond U. H., to Amerock Corporation. Cover for tissue boxes or the like. 244,653, 6-14-75, Cl. D6-98.000.

Tegner, Raymond U. H., to Amerock Corporation. Towel rack element. 244,654, 6-14-77, Cl. D6-99.000.

Tegner, Raymond U. H., to Amerock Corporation. Combined bracket and supporting arm. 244,668, 6-14-77, Cl. D8-363.000.

Thomas, Michael D.; and Ryder, Francis E., to Ryder International Corporation. Combined vacuum curettage vessel and valve closure therefor. 244,719, 6-14-77, Cl. D24-28.000.

Tiep, Darin M., to Carrousel Party Favors, Inc. Toy digital watch. 244,707, 6-14-77, Cl. D34-15.00R.

Tokiyama, Masaru, to Motorola, Inc. Mobile two-way radio apparatus or similar article. 244,697, 6-14-77, Cl. D14-68.000.

Traeger, Robert S.: *See*—
Knochel, Wayne L.; and Traeger, Robert S., 244,701.

Tsugami, Naoya, to Asahi Kogaku Kogyo Kabushiki Kaisha. Flash unit for a photographic camera. 244,687, 6-14-77, Cl. D16-42.000.

Turner, Jack Allen. Support stand for a portable calculator. 244,658, 6-14-77, Cl. D6-181.000.

Uchida Sharyo Co., Ltd.: *See*—
Uchida, Suekichi, 244,646.

Uchida, Suekichi, to Uchida Sharyo Co., Ltd. Foldable rocking chair. 244,646, 6-14-77, Cl. D6-49.000.

Vapor Corporation: *See*—
Bell, Robert R., 244,681.

Vela, Hector H. Auxiliary wheel for a skateboard. 244,706, 6-14-77, Cl. D34-15.0AJ.

Vrignaud, Guy, to Allibert Exploitation, Societe Anonyme. Mirror. 244,660, 6-14-77, Cl. D6-240.000.

W & W Steel Company: *See*—
Coles, Allen E., 244,659.

Weimer, John W. Combined bell and stand therefor. 244,678, 6-14-77, Cl. D11-157.000.

Weitzman, Lane T. Dispenser. 244,716, 6-14-77, Cl. D52-3.00R.

White, Bobbie L.: *See*—
Smyrni, Emmanuel S.; and White, Bobbie L., 244,704.

Winikoff, Stuart F. Dispensing cap for an eye drop bottle or the like. 244,670, 6-14-77, Cl. D9-261.000.

Winkler, Frederic V. Snap-on hair stylist's tray. 244,720, 6-14-77, Cl. D28-73.000.

Yates, Victor Horace, to Sutcliffe Engineering Holdings Limited, The. Swing seat. 244,708, 6-14-77, Cl. D34-5.00M.

The following are mailed under direction of the Superintendent of Documents, Government Printing Office, Washington, D.C., 20402, to whom all subscriptions should be made payable and all communications addressed:

THE OFFICIAL GAZETTE (PATENTS SECTION), issued weekly, subscription $342.20 per annum for first class mailing, also available as fourth-class mail at $250.00; foreign mailing $85.55 additional; single copies $6.60 each.

THE OFFICIAL GAZETTE (TRADEMARK SECTION), issued weekly, subscription $88.40 per annum, foreign mailing $22.10 additional; single copies $1.70 each.

CIRCULARS OF GENERAL INFORMATION concerning PATENTS, price 60 cents each.

CIRCULARS OF GENERAL INFORMATION concerning TRADEMARKS, price 50 cents each.

PRINTED COPIES OF PATENTS are furnished by the Patent and Trademark Office at 50 cents each; PLANT PATENTS in color, $1.00 each; copies of TRADEMARKS and DESIGN PATENTS at 20 cents each. Address orders to the Commissioner of Patents and Trademarks, Washington, D.C., 20231.

Printing authorized by Section 11(a)3 of Title 35, U.S. Code P.T.O.

PATENT AND TRADEMARK OFFICE NOTICES

Notice of Abandonment for Failure to Prosecute Application

Effective immediately the Patent Examining Corps will mail a communication, concerning all applications becoming abandoned in the Corps for failure to prosecute, to the correspondence address of record.

The communication to be mailed will merely comprise a copy of the first page of the Office action, to which applicant failed to properly respond, the copy including stamped language thereon indicating that the application has become abandoned and the date that the copy was mailed. The language stamped on the copy will be as follows: APPLICATION HAS BECOME ABANDONED, THIS NOTICE MAILED: ————————. In no case will the mere failure to receive a notice of abandonment affect the status of an abandoned application.

This new procedure should enable applicants to take appropriate and diligent action to reinstate an application inadvertently abandoned for failure to timely respond to an official communication. In most cases, a petition to revive under 37 CFR 1.137 will be the appropriate remedy. It may be that a response to the Office action was mailed to the Office with a certificate of mailing declaration as a part thereof (notice of October 26, 1976; 951 O.G. 1342) but was not received in the Office. In this instance, adequate relief may be available by means of a petition to withdraw the holding of abandonment.

In any instance, if action is not taken promptly after receiving the notice of abandonment, appropriate relief may not be granted.

If a lack of diligent action is predicated on the contention that neither the Office action nor the notice of abandonment was received, one may presume that there is a problem with the correspondence address of record. Accordingly, your attention is directed to recent notices of May 28, 1975, and September 9, 1976, dealing with changes of address (935 O.G. 1352 and 951 O.G. 454). In essence, it is imperative that a paper notifying the Office of a change of address be filed promptly in *each* application in which the correspondence address is to be changed.

If an application is abandoned or a patent lapsed for an excessive time a terminal disclaimer may be required. A terminal disclaimer may also be required where the holding of abandonment or lapse is withdrawn but a determination is made that action attempting to correct the problem should have been taken in a more diligent manner.

WILLIAM FELDMAN,

May 9, 1977. *Deputy Assistant Commissioner for Patents.*

Registration to Practice

The following are names of persons applying for registration to practice before the United States Patent and Trademark Office. Information tending to affect the eligibility of said applicants on moral, ethical, or other grounds, should be furnished the Commissioner of Patents and Trademarks on or before July 15, 1977.

LUTRELLE F. PARKER,
Deputy Commissioner of Patents and Trademarks and Chairman, Committee on Enrollment.

United States Patent and Trademark Office Before the Commissioner of Patents and Trademarks

IN RE HERBERT DUBNO, RESPONDENT. PROCEEDINGS FOR SUSPENSION OR DISBARMENT

Final Order

Herbert Dubno of New York City, whose registration number is 19,752 is hereby suspended, beginning on June 15, 1977, from practicing before the United States Patent and Trademark Office, without prejudice to his reinstatement after five years and after compliance with the requirement of 37 CFR § 1.341.

This action is taken under the provisions of 35 U.S.C. § 32, 37 CFR § 1.348, and 37 CFR § 2.16.

C. MARSHALL DANN,

May 25, 1977. *Commissioner of Patents and Trademarks.*

Patent Suits

Notices under 35 U.S.C. 290; Patent Act of 1952

2,908,831, G. Hirsch, SPIT DRIVE UNITS, **filed** June 2, 1976, D.C., N.D. Ill. (Chicago) Doc. 76c2042, *McGraw-Edison Company* v. *Beatrice Foods Co.* It is hereby stipulated, under F.R.C.P. Rule 41(a)(1)(ii), that the complaint and counterclaim in the above action be dismissed with prejudice, Mar. 1, 1977.

2,952,301, Schlaak and King, FOLDING STEP STOOL, **filed** Mar. 8, 1977, D.C., S.D. Ill. (Peoria) Doc. 77-1021, *Ever-Ready Appliance Manufacturing Company* v. *Hanson Scale Company, Inc.*

3,009,235, G. De Mestral, SEPARABLE FASTENING DEVICE, **filed** Feb. 28, 1977, D.C., W.D. Tenn. (Memphis) Doc. C-77-2133, *Actief, N.V. v. Comfort Care Products, Inc.*

3,056,836, H. D. Moed, ARALKYLAMINES AND METHODS OF PREPARATION THEREOF, **filed** Aug. 2, 1976, D.C., S.D.N.Y., Doc. 76-C-3324, *Mead Johnson & Company et ano. v. American Roland Corporation.* Consent judgment, defendant is permanently enjoined from further infringemet, and the above-captioned action is dismissed with prejudice, Jan. 14, 1977.

3,146,972, E. Engel, EMERGENCY CONTROL SYSTEM FOR AIRCRAFT, **filed** Aug. 30, 1976, D.C., S.D.N.Y., Doc. 76-C-3869, *Ervin Engel v. National Aeronautics and Space Administration et ano.* Memorandum, order of dismissal filed terminating above case, and complaint is dismissed in its entirety, Nov. 26, 1976.

3,545,151, Bobzin and Sawyer, SURFACE PANEL ASSEMBLY WITH RIGID STRIPS TO CONCEAL FASTENERS, **filed** Dec. 9, 1974, D.C., S.D. Mich. (Grand Rapids) Doc. 74-436, *The Celotex Corporation v. Bendix Homes Systems, Inc.* Notice of dismissal given by plaintiff, Mar. 2, 1977.

3,587,252, K. Kohl, COMBINED PRESSER AND GUIDE BAR MECHANISM FOR A WARP KNITTING MACHINE, **filed** Mar. 10, 1977, D.C., N.D. Ohio (Toledo) Doc. C77-119, *National-Standard Company v. Garbalizer Corporation of America.* **Same, filed** Mar. 10, 1977, D.C., N.D. Ohio (Toledo) Doc. C77-120, *J. Rush Snyder et al. v. Garbalizer Corporation of America.*

3,718,484, C. W. Gray, STRINGSHOT BACK-OFF TOOL, **filed** Mar. 9, 1977, D.C., E.D. La. (New Orleans) Doc. C.A. 77-751, *Claude W. Gray v. Edwards Rental & Fishing Tools, Inc.*

3,715,718, R. A. Astengo, GROUND PROXIMITY WARNING SYSTEM UTILIZING RADIO AND BAROMETRIC ALTIMETER COMBINATION, **filed** Mar. 9, 1977, D.C., W.D. Wash. (Seattle) Doc. C77-164S, *Sundstrand Data Control, Inc. v. Ralph A. Astengo.*

3,730,077, B. Selden, COLLAPSIBLE LAPBOARD STRUCTURE, **filed** Feb. 24, 1977, D.C., C.D. Calif. (Los Angeles) Doc. CV77-653-LTL, *Michele R. Selden v. Mark Distributors, Inc.*

3,740,980, Schimizzi and Schimizzi, AUTOMOBILE TRUNK LOCK MECHANISM (ANTI-THEFT DEVICE), **filed** Mar. 10, 1977, D.C., S.D.N.Y., Doc. 77-C-1169(MP), *Gregory Frank Schimizzi and Ernest Joseph Schimizzi v. Chrysler Corporation.*

3,789,210, Weber, Shroyer and Baker, RECESSED LIGHTED ASSIST BAR, **filed** Mar. 8, 1977, D.C., N.D. Ind. (South Bend) Doc. S77-0034, *Progressive Dynamics, Inc. v. ILC Products Company, Inc.*

3,821,830, J. J. Sundheim, CLEANER FOR CARPETS AND THE LIKE, **filed** Feb. 23, 1977, D.C. Colo. (Denver) Doc. 77-M-210, *Windsor Industries Inc. v. Burnside Equipment Ltd.*

3,822,707, Adducci and Schwalm, METAL-ENCLOSED PACER WITH SOLID-STATE POWER SOURCE, **filed** Mar. 11, 1977, D.C., W.D.N.Y. (Buffalo) Doc. 77-127, *Cardiac Pacemakers, Inc. v. Medtelectronics, Ltd.*

3,826,222, J. M. ROMICK, UNIT-DOSE MEDICATION HANDLING SYSTEM, **filed** Nov. 12, 1976, D.C., N.D. Ohio (Cleveland) Doc. C76-1202. *J. M. Romick v. Americare, Inc.* Stipulation and order dismissing action without prejudice, Mar. 10, 1977.

3,837,981, T. R. Flint, EPOXY TAPE, **filed** Oct. 6, 1976, D.C., N.D. Ga. (Atlanta) Doc. C76-1637A, *Theodore R. Flint and Polymeric Systems, Inc. v. Dynatron Bondo Corporation.* Consent judgment, defendant is enjoined from use of said epoxy tape, Mar. 7, 1977.

3,844,000, J. Hedu, CLASP; **D. 200,155,** same, CLASP FASTENER OR SIMILAR ARTICLE, **filed** May 23, 1975, D.C.N.J. (Newark) Doc. 75-889, *The Siemon Company v. E-Z Buckle, Inc.* Action dismissed, May 23, 1975.

3,900,250, E. J. Ivani, SEMI-RIGID, GAS PERMEABLE CONTACT LENSES, **filed** Mar. 1, 1977, D.C., C.D. Calif. (Los Angeles) Doc. CV77-784-RJK, *Continuous Curve Contact Lenses, Inc. v. Rybci Scientific Corporation.*

3,902,584, Lee and Asbo, PAPER FEED SYSTEM FOR HIGH-SPEED PRINTER; **3,954,168,** A. Gabor, HIGH SPEED PRINTER WITH INTERMITTENT PRINT WHEEL AND CARRIAGE, **filed** May 7, 1976, D.C., N.D. Calif. (San Francisco) Doc. C76-934-GBH, *Xerox Corporation v. Qume Corporation and Sen Lin Lee (also known as David Lee).* Parties stipulated to a dismissal without prejudice, Nov. 12, 1976.

3,954,168. (See 3,902,584.)

3,999,748, W. A. Clarke, CHILDREN'S GAME OF CATCH, **filed** Mar. 2, 1977, D.C., W.D. Pa. (Erie) Doc. 77-28 Erie, *William A. Clarke v. G. A. Kayser & Sons, Inc. et al.*

4,009,497, J. R. Moon, WATER SAVING PANEL DEVICE FOR WATER CLOSETS, **filed** Mar. 2, 1977, D.C., M.D.N.C. (Greensboro) Doc. C77-108-D, *Moon Watersaver, Inc. and Watersavers, Inc. v. Fitch Lumber Company, Inc.* **Same, filed** Mar. 4, 1977, D.C., M.D.N.C. (Greensboro) Doc. 77-116-D, *Moon Watersavers, Inc. and Watersavers, Inc. v. Kerr Discount Drugs.*

D. 200,155. (See 3,844,000.)

D. 231,758, A. Rosselli, COUCH; **D. 231,759,** same, ARMCHAIR, **filed** Feb. 28, 1977, D.C., S.D. Fla. (Fort Lauderdale) Doc. 77-456-C-NCR, *Industria Arredamenti Fratelli Saporiti v. Carriage House Showrooms, Inc.*

D. 231,759. (See D. 231,758.)

D. 238,268, C. Strada, MOTORCYCLE EXHAUST PIPE, **filed** Mar. 3, 1977, D.C., E.D. Wis. (Milwaukee) Doc. 77-C-135, *Harley-Davidson Motor Co., Inc. v. Charles Strada.*

REISSUE APPLICATIONS FILED

Notice under 37 CFR 1.11(b). The reissue applications listed below are open to inspection by the general public in the indicated Examining Groups and copies may be obtained by paying the fee therefor (37 CFR 1.21(b)).

3,085,386, Re. S.N. 790,771, Filed Apr. 25, 1977, Cl. 56/25.4, ROTARY LAWNMOWER, Arthur J. Slemmons, Owner of Record: *Food Machinery and Chemical Corporation, San Jose, Calif.,* Attorney or Agent: F. W. Anderson, et al., Ex. Gp.: 333

3,569,747, Re. S.N. 790,055, Filed Apr. 22, 1977, Cl. 310/8.1, PIEZOELECTRIC TRANSDUCER, Vernon H. Siegel, Owner of Record: *Sundstrand Data Control, Inc., Redmond, Wash.,* Attorney or Agent: Ernest A. Wegner, et al., Ex. Gp.: 212

3,602,733, Re. S.N. 790,569, Filed Apr. 25, 1977, Cl. 307/209, THREE OUTPUT LEVEL LOGIC CIRCUIT, Edward M. Aoki, Owner of Record: *Signetics Corporation, Sunnyvale, Calif.,* Attorney or Agent: C. Richard Pfeiffer, et al., Ex. Gp.: 254

3,735,161, Re. S.N. 790,513, Filed Apr. 25, 1977, Cl. 310/9.5, PIEZOELECTRIC TRANSDUCER, George D. Perkins, et al., Owner of Record: *Bell & Howell Company, Pasadena, Calif.,* Attorney or Agent: Robert Berliner, Ex. Gp.: 212

3,789,711, Re. S.N. 789,336, Filed Apr. 20, 1977, Cl. 83/61, PUNCH PRESS DISCHARGE FEEDER, Dennis E. Mead, Owner of Record: *Lipe Rollway Corporation, Liverpool, N.Y.,* Attorney or Agent: Eugene S. Stephens, et al., Ex. Gp.: 324

3,810,453, Re. S.N. 789,191, Filed Apr. 20, 1977, Cl. 123/139 R, FUEL INJECTION SYSTEM, George D. Wolff, Owner of Record: *Inventor,* Attorney or Agent: John F. Learman, et al., Ex. Gp.: 342

3,880,313, Re. S.N. 790,681, Filed Apr. 25, 1977, Cl. 215/211, SAFETY CAP AND CONTAINER, Edward G. Akers, Owner of Record: *Inventor,* Attorney or Agent: Peter J. Murphy, Ex. Gp.: 241

3,880,633, Re. S.N. 791,737, Filed Apr. 28, 1977, Cl. 65/60, METHOD OF COATING A GLASS RIBBON ON A LIQUID FLOAT BATH, John F. Jordan, et al., Owner of Record: *Photon Power, Inc., Wilmington, Del.,* Attorney or Agent: Ronald L. Engel, et al., Ex. Gp.: 173

3,885,170, Re. S.N. 794,061, Filed May 5, 1977, Cl. 307/252 UA, METHOD FOR MOTOR CONTROL, Roman Kuzyk, Owner of Record: *Inventor,* Attorney or Agent: Martha G. Pugh, Ex. Gp.: 254

3,897,451, Re. S.N. 793,188, Filed May 2, 1977, Cl. 260/325 R, SYNTHESIS OF OXINDOLES FROM ANILINES AND INTERMEDIATES THEREIN, Paul G. Gassman, Owner of Record: *The Ohio State University Research Foundation, Columbus, Ohio,* Attorney or Agent: Gordon W. Hueschen, Ex. Gp.: 121

3,926,169, Re. S.N. 780,404, Filed Mar. 23, 1977, Cl. 123/32 SJ, COMBINED FUEL VAPOR INJECTOR AND IGNITER SYSTEM FOR INTERNAL COMBUSTION ENGINES, Ervin Leshner, et al., Owner of Record: *Fuel Injection Development Corporation, Palmyra, N.J.,* Attorney or Agent: Frederick W. Powers, III, et al., Ex. Gp.: 342

3,937,907, Re. S.N. 791,624, Filed Apr. 27, 1977, Cl. 179/170.6, DIGITAL ECHO SUPPRESSOR, Samuel Joseph Campanella, et al., Owner of Record: *Communications Satellite Corporation, Washington, D.C.,* Attorney or Agent: Richard C. Sughrue, et al., Ex. Gp.: 232

3,938,308, Re. S.N. 785,187, Filed Apr. 6, 1977, Cl. 57/52, METHOD AND DEVICE FOR TRANSFERRING FRESH BOBBINS FROM A BOBBIN SUPPLY DEVICE TO A CONVEYER BELT OF A TEXTILE MACHINE, Ikuo Komura, et al., Owner of Record: *Kobushiki Kaisha Toyoda Jidoshokki Seisakusho, Aichi, Japan,* Attorney or Agent: Milton J. Wayne, Ex. Gp.: 244

3,970,331, Re. S.N. 792,028, Filed Apr. 28, 1977, Cl. 281/21 R, BINDER ELEMENT, Joe D. Giulie, Owner of Record: *Minnesota Mining and Manufacturing Company, St. Paul, Minn.,* Attorney or Agent: Cruzan Alexander, et al., Ex. Gp.: 334

3,974,707, Re. S.N. 793,366, Filed May 3, 1977, Cl. 74/217 B, DERAILLEUR FOR A BICYCLE, Masashi Nagano, Owner of Record: *Shimano Industrial Company, Limited, Japan,* Attorney or Agent: Davidson C. Miller, et al., Ex. Gp.: 345

3,998,494, Re. S.N. 792,031, Filed Apr. 28, 1977, Cl. 301/37 P, WHEEL AND GREASE CAP ASSEMBLY, Edward G. Spisak, Owner of Record: *Inventor,* Attorney or Agent: Hugh L. Fisher, et al., Ex. Gp.: 311

4,014,215, Re. S.N. 789,794, Filed Apr. 22, 1977, Cl. 73/371, CLINICAL GLASS THERMOMETER HAVING A STEM AND A BULB INTEGRALLY FORMED THEREWITH, Seymour N. Blackman, Owner of Record: *Inventor,* Attorney or Agent: David B. Kirschstein, et al., Ex. Gp.: 244

National Technical Information Service

GOVERNMENT-OWNED INVENTIONS

Availability for Licensing

The inventions listed below are owned by the U.S. Government and are available for U.S. and possibly foreign licensing, in accordance with the policies of the agency sponsors.

Copies of the patents cited are available from the Commissioner of Patents and Trademarks, Washington, D.C. 20231, for $.50 each. Requests for copies of patents must include the patent number.

Copies of the patent applications, either paper copy (PC) or microfiche (MF), can be purchased at the prices cited from the National Technical Information Service (NTIS), Springfield, Virginia 22161. Requests for copies of patent applications must include the patent application number. Claims are deleted from patent application copies sold to the public to avoid premature disclosure in the event of an interference before the Patent and Trademark Office. Claims and other technical data will usually be made available to serious prospective licensees by the agency which filed the case.

Requests for licensing information on a particular invention should be directed to the address cited for the agency-sponsor.

DOUGLAS J. CAMPION,
Patent Program Coordinator.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 684,429. Fluidic Oscillating Jet for High Frequency Gust Tunnel. Filed May 7, 1976. PC $3.50/MF $3.00.

Patent 3,956,015. Lightweight Nickel Hydrogen Cell. Filed June 6, 1975. Patented May 11, 1976. Not available NTIS.

Patent 3,958,119. Method and Device for Evaluating Penetrants. Filed Aug. 5, 1974. Patented May 18, 1976. Not available NTIS.

Patent 3,959,740. Quartz Wedge Polarizer for an Electro Optic Switch. Filed Feb. 6, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,963,196. Aircraft/Spacecraft Ground Accelerator. Filed June 12, 1974. Patented June 15, 1976. Not available NTIS.

Patent 3,963,911. Hybrid Sample Data Filter. Filed Apr. 22, 1975. Patented June 15, 1976. Not available NTIS.

Patent 3,965,462. Serpentine Charge-Coupled-Device Memory Circuit. Filed May 9, 1975. Patented June 22, 1976. Not available NTIS.

Patent 3,966,160. Inflight Intravenous Bottle Holder. Filed May 12, 1975. Patented June 29, 1976. Not available NTIS.

Patent 3,966,729. Addition Curable Phenyl-Quinoxaline Compositions and Their Synthesis. Filed May 19, 1975. Patented June 29, 1976. Not available NTIS.

Patent 3,966,855. Method of Fabricating Silicon Carbide Articles. Filed Feb. 22, 1974. Patented June 29, 1976. Not available NTIS.

Patent 3,967,102. Self-Adjusting Digital Notch Filter. Filed Mar. 25, 1975. Patented June 29, 1976. Not available NTIS.

U.S. DEPARTMENT OF AGRICULTURE
Research Agreements and Patent Mgmt. Branch, General Services Division, Federal Bldg., Agriculture Research Service, Hyattsville, Md. 20782

Patent application 686,423. Continuous Mechanized Harvesting of Horticultural Crops. Filed May 14, 1976. PC $3.50/MF $3.00.

Patent application 686,424. Metering and Spray Apparatus for Horticultural Applications. Filed May 14, 1976. PC $3.50/MF $3.00.

U.S. DEPARTMENT OF TRANSPORTATION
Patent Counsel, 400 7th St., SW.
Washington, D.C. 20590

Patent 3,975,730. Radio Theodolite Angle Measuring Apparatus. Filed Feb. 11, 1975. Patented Aug. 17, 1976. Not available NTIS.

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
National Institutes of Health, Chief, Patent Branch
Westwood Bldg., Bethesda, Md. 20014

Patent application 698,688. Powered Wheel Chair. Filed June 22, 1976. PC $3.50/MF $3.00.

Patent application 698,689. Synthesis of Daunosamine Hydrochloride From a D-Mannose Starting Material. Filed June 22, 1976. PC $3.50/MF $3.00.

Patent application 699,996. Ultrasonic Transducer Calibration. Filed June 25, 1976. PC $3.50/MF $3.00.

U.S. DEPARTMENT OF THE NAVY
Assistant Chief for Patents, Office of Naval Research—Code 302, Arlington, Va. 22217

Patent application 461,834. Optical Temperature Probe. Filed Apr. 18, 1974. PC $3.50/MF $3.00.

Patent application 464,604. Apparatus for Collecting Deep-Sea Sediment Pore Water. Filed Apr. 26, 1974. PC $3.50/MF $3.00.

Patent application 576,923. Electrochemical Formation of Graphite Intercalation Compounds for Storage Batteries. Filed May 12, 1975. PC $3.50/MF $3.00.

Patent application 622,285. Broadband Millimeter Wave Amplifier. Filed Oct. 10, 1974. PC $3.50/MF $3.00.

Patent application 674,356. Memory Wire and Synchronous Plating Techniques Therefore. Filed Apr. 7, 1976. PC $3.50/MF $3.00.

Patent application 677,944. A Digital Flow Control System. Filed Apr. 26, 1976. PC $3.50/MF $3.00.

Patent application 680,013. Fluid Fill or Bleed Apparatus. Filed Apr. 23, 1976. PC $3.50/MF $3.00.

Patent application 683,996. Mechanical-Chemical Linkage Between Polymer Layers. Filed May 6, 1976. PC $3.50/MF $3.00.

Patent application 686,855. Multifrequency Array Using Common Phasors. Filed May 17, 1976. PC $3.50/MF $3.00.

Patent application 689,015. Microscope. Filed May 24, 1976. PC $3.50/MF $3.00.

Patent application 689,692. Toxic Gas Control for RF Absorber Fires. Filed May 24, 1976. PC $3.50/MF $3.00.

Patent application 689,891. Scuttling Valve. Filed May 25, 1976. PC $3.50/MF $3.00.

Patent application 690,699. Acoustic Surface Wave Device. Filed May 27, 1976. PC $3.50/MF $3.00.

Patent application 691,122. Reducing Electrostatic Hazard of CO_2 Fire Extinguishers. Filed May 28, 1976. PC $3.50/MF $3.00.

Patent application 691,753. A Connector for Coupling Multi-Filament Fiber Optic Cables. Filed June 1, 1976. PC $3.50/MF $3.00.

Patent application 693,592. Electric Discharge Gasdynamic Laser. Filed June 7, 1976. PC $3.50/MF $3.00.

Patent application 693,808. Ferroelectric Crystals Having Tailored Domain Patterns. Filed June 7, 1976. PC $4.00/MF $3.00.

Patent application 695,296. Ceramic Compositions. Filed June 11, 1976. PC $3.50/MF $3.00.

Patent application 695,298. Compact Three-Beam Interferometer. Filed June 11, 1976. PC $3.50/MF $3.00.

Patent application 695,614. Self Learning Monitor for VLF Wave Propagation. Filed June 14, 1976. PC $3.50/MF $3.00.

Patent application 696,238. Vinyl Polymerization Initiator and Reducing Agent. Filed June 15, 1976. PC $3.50/MF $3.00.

Patent application 700,279. Composite for Improved Stripline Board Material. Filed June 28, 1976. PC $3.50/MF $3.00.

Patent application 700,683. An Electro Optic Binary Adder. Filed June 28, 1976. PC $3.50/MF $3.00.

Patent application 701,467. Fiber Optic Cable Connector. Filed July 1, 1976. PC $3.50/MF $3.00.

Patent application 702,377. Double-Layer Oxide Gate Insulators for Field-Effect Transistors. Filed July 2, 1976. PC $3.50/MF $3.00.

Patent 3,896,328. Dual Mode CRT Screen. Filed May 28, 1974. Patented July 22, 1975. Not available NTIS.

Patent 3,898,984. Ambulatory Patient Monitoring System. Filed Feb. 4, 1974. Patented Aug. 12, 1975. Not available NTIS.

Patent 3,910,218. Propellant-Actuated Deep Water Anchor. Filed Feb. 4, 1974. Patented Oct. 7, 1975. Not available NTIS.

Patent 3,922,063. Winch Mounted Optical Data Transmission Cable With Fluid Coupling. Filed Aug. 29, 1974. Patented Nov. 25, 1975. Not available NTIS.

Patent 3,931,392. Enhancement of Ultimate Tensile Strength of Carbon Fibers. Filed Jan. 10, 1974. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,933,390. Attachment Devices for Underwater Salvage. Filed May 22, 1974. Patented Jan. 20, 1976. Not available NTIS.

Patent 3,937,942. Multi-Channel Optical Correlation System. Filed July 1, 1974. Patented Feb. 10, 1976. Not available NTIS.

Patent 3,945,920. Coanda Effect Oil-Water Separator. Filed Oct. 3, 1974. Patented Mar. 23, 1976. Not available NTIS.

Patent 3,947,850. Notch Fed Electric Microstrip Dipole Antenna. Filed Apr. 24, 1975. Patented Mar. 30, 1976. Not available NTIS.

Patent 3,952,505. High Performance Ramjet Fuels. Filed July 26, 1974. Patented Apr. 27, 1976. Not available NTIS.

Patent 3,954,015. Method of Determining Piezoelectric Constants of Ceramic Rings. Filed July 17, 1975. Patented May 4, 1976. Not available NTIS.

Patent 3,954,323. Optical Waveguide Linear Modulator Array. Filed Mar. 23, 1973. Patented May 4, 1976. Not available NTIS.

Patent 3,956,706. Miniaturized Millimeter Wave Instantaneous Frequency Discriminator. Filed Feb. 3, 1975. Patented May 11, 1976. Not available NTIS.

Patent 3,957,296. Vacuum Multiplier. Filed May 5, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,957,672. Displacement of Organic Liquid Films From Solid Surfaces by Non Aqueous Systems. Filed Nov. 23, 1973. Patented May 18, 1976. Not available NTIS.

Patent 3,958,109. Universal Modularized Digital Controller. Filed Jan. 20, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,958,189. Stimulated Coherent Cyclotron Scattering, Millimeter, and Submillimeter Wave Generator. Filed June 4, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,958,214. Encoded Echo-Ranging Signal Generator. Filed July 19, 1963. Patented May 18, 1976. Not available NTIS.

Patent 3,958,243. Circuit for Generating a Digital or Analog Signal as a Function of Doppler Frequency. Filed Mar. 20, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,958,858. Modified Circuit Card Extender. Filed Sept. 10, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,959,127. Biodegradation of Oil on Water Surfaces. Filed Mar. 13, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,959,582. Solid State Electronically Rotatable Raster Scan for Television Cameras. Filed Mar. 31, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,959,665. Logic Circuits With Interfacing System. Filed May 29, 1974. Patented May 25, 1976. Not available NTIS.

Patent 3,960,100. Pressurized Ship Structure for Slamming Loads. Filed June 2, 1975. Patented June 1, 1976. Not available NTIS.

Patent 3,961,274. Noise Riding Threshold. Filed Mar. 10, 1975. Patented June 1, 1976. Not available NTIS.

Patent 3,961,282. Tracking Status Detector for a Digital Delay Lock Loop. Filed Apr. 28, 1975. Patented June 1, 1976. Not available NTIS.

Patent 3,961,291. Apparatus and Method for Mapping Acoustic Fields. Filed Nov. 29, 1974. Patented June 1, 1976. Not available NTIS.

Patent 3,962,672. Tethered Vehicle Location System. Filed July 16, 1975. Patented June 8, 1976. Not available NTIS.

Patent 3,962,697. Low Level Bio-Telemetry System Using C/MOS Multiplexing. Filed June 16, 1975. Patented June 8, 1976. Not available NTIS.

Patent 3,963,198. Negative Air Cushion for Airship Ground Handling. Filed Apr. 2, 1975. Patented June 15, 1976. Not available NTIS.

Patent 3,963,308. Focusing Coupling Device for Multi-Optical-Fiber Cable. Filed June 25, 1973. Patented June 15, 1976. Not available NTIS.

Patent 3,964,013. Cavitating Parametric Underwater Acoustic Source. Filed Oct. 22, 1974. Patented June 15, 1976. Not available NTIS.

Patent 3,965,402. Headrest Proportional Control for Motorized Wheelchair. Filed July 1, 1974. Patented June 22, 1976. Not available NTIS.

Patent 3,967,224. Coated Magnetically Biased Reed Switch. Filed Apr. 25, 1975. Patented June 29, 1976. Not available NTIS.

Patent 3,968,399. Method for Driving a LED at High Speed. Filed Mar. 19, 1975. Patented July 6, 1976. Not available NTIS.

Patent 3,968,455. Injection Laser With Integral Modulator. Filed Mar. 5, 1974. Patented July 6, 1976. Not available NTIS.

Patent 3,969,925. In Situ Oceanographic Sample Separator. Filed Sept. 16, 1975. Patented July 20, 1975. Not available NTIS.

Patent 3,970,156. Water Weighted Corer. Filed Sept. 15, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,833. High-Speed Adder. Filed June 18, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,855. Positron Probes for Mechanical Fatigue Detection System. Filed May 23, 1975. Patented July 20, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent 3,965,428. Spectrum-Shape Discrimination On/Off Target Indicator. Filed Jan. 4, 1971. Patented June 22, 1976. Not available NTIS.

Patent 3,965,470. Pulse Analyzer for an RF Moving Target Detector. Filed Dec. 13, 1972. Patented June 22, 1976. Not available NTIS.

Patent 3,965,471. Radiation Detection System. Filed Aug. 13, 1969. Patented June 22, 1976. Not available NTIS.

Patent 3,965,821. Low Spin-Deceleration Safing and Arming Mechanism. Filed Jan. 16, 1975. Patented June 29, 1976. Not available NTIS.

Patent 3,966,146. Air Bladder Seat Cushion for High Acceleration Cockpit. Filed Mar. 10, 1975. Patented June 29, 1976. Not available NTIS.

U.S. DEPARTMENT OF AGRICULTURE
Research Agreements and Patent Mgmt. Branch, General Services Division, Federal Bldg., Agriculture Research Service, Hyattsville, Md. 20782

Patent application 706,980. Method for Insolubilizing Enzymes on Chitosan. Filed July 19, 1976. PC $3.50/MF $3.00.

Patent application 708,792. Highly Absorbent Polymeric Compositions Derived From Flour. Filed July 26, 1976. PC $3.50/MF $3.00.

Patent application 714,229. Method of Peeling Fruits and Vegetables With Carboxylic Acids. Filed Aug. 13, 1976. PC $3.50/MF $3.00.

Patent 3,968,254. Method of Preparing Feed Grain Compositions. Filed June 23, 1975. Patented July 6, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE INTERIOR
Branch of Patents, 18th & C Sts., NW
Washington, D.C. 20240

Patent 3,898,042. Method and Apparatus for Continuously Determining Total Copper in an Aqueous Stream. Filed Jan. 2, 1974. Patented Aug. 5, 1975. Not available NTIS.

U.S. DEPARTMENT OF THE NAVY
Assistant Chief for Patents, Office of Naval Research—Code 302, Arlington, Va. 22217

Patent application 543,745. Transient Event Data Acquisition Apparatus for Use With Radar Systems and the Like. Filed Jan. 24, 1975. PC $3.50/MF $3.00.

Patent application 587,171. Constant False Alarm Rate (CFAR) Circuitry for Minimizing Extraneous Target Sensitivity. Filed June 16, 1975. PC $3.50/MF $3.00.

Patent application 587,173. Injection-Molding Apparatus for Attaching End Fittings to Detonating Cords. Filed June 16, 1975. PC $3.50/MF $3.00.

Patent application 589,482. Booster Apparatus for Augmenting Side Initiation of Explosive Cords. Filed June 23, 1975. PC $3.50/MF $3.00.

Patent application 642,926. Electrical Field Sensing and Transmitting Apparatus. Filed Dec. 22, 1975. PC $3.50/MF $3.00.

Patent application 643,047. Multi-Path Signal Enhancing Apparatus. Filed Dec. 22, 1975. PC $3.50/MF $3.00.

Patent application 683,097. A Non-Tumbling Limit Stop Providing a Mechanical Super Cage. Filed May 6, 1976. PC $3.50/MF $3.00.

Patent application 697,514. Parallel/Time-Shared Variable Time Delay Generator With Common Timing Control and Fast Recovery. Filed June 18, 1976. PC $3.50/MF $3.00.

Patent 3,958,157. Oil Level Detection Circuit. Filed Feb. 12, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,958,241. Chaff Discrimination System. Filed Nov. 2, 1961. Patented May 18, 1976. Not available NTIS.

Patent 3,958,780. Convertible Canopy-to-Wing Shaped Parachute. Filed Apr. 9, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,961,304. Decoupled Hydrophone With Reduced Response to Vibration and Stress Concentration. Filed Oct. 21, 1974. Patented June 1, 1976. Not available NTIS.

Patent 3,961,305. Fluid for Filling Sonar Transducers. Filed Feb. 14, 1975. Patented June 1, 1976. Not available NTIS.

Patent 3,961,520. Apparatus for Mechanically Exercising Bourdon Tube Gauge. Filed May 27, 1975. Patented June 8, 1976. Not available NTIS.

Patent 3,968,455. Injecting Laser With Integral Modulator. Filed Mar. 5, 1974. Patented July 6, 1976. Not available NTIS.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Assistant General Counsel for Patent Matters NASA—
Code GP-2, Washington, D.C. 20546

Patent application 691,647. A Logic-Controlled Occlusive Cuff System. Filed June 1, 1976. PC $3.50/MF $3.00.

Patent application 692,413. Extraction and Separation of a Preferentially Photo-Dissociated Molecular Isotope Into Positive and Negative Ions by Means of an Electric Field. Filed June 3, 1976. PC $3.50/MF $3.00.

Patent 3,964,306. System for Measuring Reynolds in a Turbulently Flowing Fluid. Patented June 22, 1976. Not available NTIS.

Patent 3,964,319. Instrumentation for Measuring Aircraft Noise and Sonic Boom. Patented June 22, 1976. Not available NTIS.

Patent 3,964,813. Connector. Patented June 22, 1976. Not available NTIS.

Patent 3,964,902. Method of Forming a Wick for a Heat Pipe. Patented June 22, 1976. Not available NTIS.

Patent 3,964,928. Lead-Oxygen DC Power Supply System Having a Closed Loop Oxygen and Water System. Patented June 22, 1976. Not available NTIS.

Patent 3,965,354. Resistive Anode Image Converter. Patented June 22, 1976. Not available NTIS.

Patent 3,965,475. Switchable Beamwidth Monopulse Method and System. Patented June 22, 1976. Not available NTIS.

Patent 3,966,547. Method of Producing I-123. Patented June 29, 1976. Not available NTIS.

U.S. DEPARTMENT OF AGRICULTURE
Research Agreements and Patent Mgmt. Branch, General Services Division, Federal Bldg., Agriculture Research Service, Hyattsville, Md. 20782

Patent 3,771,348. Analog Fluoric Gas Concentration Sensor. Filed Feb. 28, 1972. Patented Nov. 13, 1973. Not available NTIS.

Patent 3,915,645. Chemical Reaction Transducers for Use With Fluoric Gas Concentration Sensing Systems. Filed Apr. 24, 1973. Patented Oct. 28, 1975. Not available NTIS.

Patent 3,922,608. Electromagnetic Interference Locator. Filed Nov. 29, 1973. Patented Nov. 25, 1975. Not available NTIS.

Patent 3,925,315. Diglicidyl Ether of 4-Methylol Resorcinol. Filed Sept. 20, 1974. Patented Dec. 9, 1975. Not available NTIS.

Patent 3,926,221. Laminar Fluidic Multiplier. Filed Aug. 14, 1974. Patented Dec. 16, 1975. Not available NTIS.

Patent 3,928,076. LiCl Inhibitor for Perchlorate Battery. Filed Sept. 13, 1974. Patented Dec. 23, 1975. Not available NTIS.

Patent 3,928,112. Process for Producing Stabilized Anatase Titanium Dioxide Surfaces for Durable Adhesive Bonding. Filed Jan. 4, 1974. Patented Dec. 23, 1975. Not available NTIS.

Patent 3,929,717. Alcohol Sensitive Repairable Epoxy Embedding Material. Filed June 28, 1974. Patented Dec. 30, 1975. Not available NTIS.

Patent 3,930,317. Electronic Azimuth Transfer Method and System. Filed May 10, 1974. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,930,519. Pressure Regulator. Filed Feb. 13, 1975. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,930,541. Flame Prevention System for Fuel Tank Fires. Filed Oct. 22, 1974. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,930,550. Vehicle Drive and Suspension. Filed Aug. 15, 1974. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,930,553. Track Tension Control. Filed Nov. 22, 1974. Patented Jan. 6, 1976. Not available NTIS.

Patent 3,941,345. Radial Arm Guidance Platform Tracker. Filed Nov. 28, 1973. Patented Mar. 2, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 696,342. Probe System for Wind Tunnel Test Section. Filed June 15, 1976. PC $3.50/MF $3.00.

Patent 3,970,006. Protective Cover for a Missile Nose Cone. Filed Jan. 16, 1975. Patented July 20, 1975. Not available NTIS.

U.S. DEPARTMENT OF AGRICULTURE
Research Agreements and Patent Mgmt. Branch, General Services Division, Federal Bldg., Agriculture Research Service, Hyattsville, Md. 20782

Patent application 712,298. Insolubilization of Enzymes on Modified Phenolic Polymers. Filed Aug. 8, 1976. PC $3.50/MF $3.00.

Patent 3,972,897. Mosquito Larvicide. Filed Oct. 30, 1975. Patented Aug. 3, 1976. Not available NTIS.

Patent 3,972,918. Process for Separating DOPA From Tyrosine. Filed June 28, 1974. Patented Aug. 3, 1976. Not available NTIS.

Patent 3,975,270. Process for Recovering Usable Olive-Processing Liquor From Olive-Processing Waste Solution. Filed Dec. 3, 1975. Patented Aug. 17, 1976. Not available NTIS.

Patent 3,976,552. Water-Soluble Graft Polymers Produced by an Outwardly Dry Radiation Polymerization Process. Filed Aug. 13, 1975. Patented Aug. 24, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE INTERIOR
Branch of Patents, 18th & C Sts., NW
Washington, D.C. 20240

Patent application 702,262. Production of Alumina Monohydrate From Aluminum Nitrate Solutions. Filed July 2, 1976. PC $3.50/MF $3.00.

Patent application 707,973. Method for Producing Raney Type Catalyst. Filed July 23, 1976. PC $3.50/MF $3.00.

Patent application 713,452. Spectrally Selective Solar Absorbers. Filed Aug. 11, 1976. PC $3.50/MF $3.00.

U.S. DEPARTMENT OF THE NAVY
Assistant Chief for Patents, Office of Naval Research—
Code 302, Arlington, Va. 22217

Patent application 458,927. Suspension System for Directional Hydrophones. Filed Apr. 1, 1974. PC $3.50/MF $3.00.

Patent 3,970,862. Polymeric Sensor of Vibration and Dynamic Pressure, Filed Juue 25, 1974. Patented July 20, 1976. Not available NTIS.

Patent 3,970,952. Broadband Output Circuit for Klystron Amplifier. Filed May 15, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,965. Injection Locked Josephson Oscillator Systems. Filed Mar. 26, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,971,057. Lateral Photodetector of Improved Sensitivity. Filed Aug. 21, 1973. Patented July 20, 1976. Not available NTIS.

Patent 3,971,068. Image Processing System. Filed Aug. 22, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,971,939. Unitary Laser/IR Seeker. Filed Aug. 19, 1975. Patented July 27, 1976. Not available NTIS.

Patent 3,973,263. Sensitivity Improvement of Spaced-Loop Antenna by Capacitive Gap Loading. Filed Apr. 20, 1973. Patented Aug. 3, 1976. Not available NTIS.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Assistant General Counsel for Patent Matters NASA—
Code GP-2, Washington, D.C. 20546

Patent application 692,413. Extraction and Separation of a Preferentially Photo-Dissociated Molecular Isotope Into Positive and Negative Ions by Means of an Electric Field. Filed June 3, 1976. PC $3.50/MF $3.00.

Patent 3,967,091. Capillary Flow Weld-Bonding. Patented June 29, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent application 685,210. Jet Engine Tail Pipe Flow Deflector. Filed May 11, 1976. PC $3.50/MF $3.00.

Patent application 685,247. Vortex Flow Particle Accelerator. Filed May 11, 1976. PC $5.50/MF $3.00.

Patent 3,957,206. Extendable Rocket Motor Exhaust Nozzle. Filed Jan. 27, 1975. Patented May 18, 1976. Not available

U.S. DEPARTMENT OF TRANSPORTATION
Patent Counsel, 400 7th St., SW.
Washington, D.C. 20590

Patent application 713,906. Critical Coordination Tester. Filed Aug. 12, 1976. PC $3.50/MF $3.00.

Patent application 715,424. Road-Runner Alcohol Safety Interlock System. Filed Aug. 18, 1976. PC $3.50/MF $3.00.

U.S. DEPARTMENT OF HEALTH, EDUCATION, AND WELFARE
National Institutes of Health, Chief, Patent Branch
Westwood Bldg., Bethesda, Md. 20014

Patent application 557,183. Method for the Preparation of Oxygenated Benzo(c)Phenanthridine Compounds. Filed Mar. 10, 1975. PC $4.00/MF $3.00.

Patent application 692,915. Synthesis of 2-Alkanoylamino-4-Nitrophenyl Phosphorylcholine-Hydroxide. Filed June 4, 1976. PC $3.50/MF $3.00.

Patent 3,956,895. Heat Engine. Filed Oct. 10, 1974. Patented May 18, 1976. Not available NTIS.

Patent 3,962,040. Method and Apparatus for Plating and Counting Aerobic Bacteria. Filed Jan. 28, 1975. Patented June 8, 1976. Not available NTIS.

Patent 3,965,868. Laboratory Mouse Feeder. Filed Apr. 14, 1975. Patented June 29, 1976. Not available NTIS.

U.S. DEPARTMENT OF THE NAVY
Assistant Chief for Patents, Office of Naval Research—
Code 302, Arlington, Va. 22217

Patent application 625,360. A Multiple Channel Decommutator Accumulator. Filed Oct. 22, 1976. PC $3.50/MF $3.00.

Patent application 651,876. High Accuracy Sweep Oscillator System. Filed Jan. 23, 1976. PC $3.50/MF $3.00.

Patent application 652,034. A System for Vapor Cooling Electronic Equipment. Filed Jan. 26, 1976. PC $3.50/MF $3.00.

Patent application 652,036. Saturating Transformer Inverter Circuit. Filed Jan. 16, 1976. PC $3.50/MF $3.00.

Patent application 652,919. Selective Zoom Camera and Display. Filed Jan. 28, 1976. PC $3.50/MF $3.00.

Patent application 656,775. Laser System Having Frequency Doubling. Filed Feb. 9, 1976. PC $3.50/MF $3.00.

Patent application 661,479. Isolation Amplifier for Resistive and Inductive Loads. Filed Feb. 26, 1976. PC $3.50/MF $3.00.

Patent application 662,659. Phase-Locking Mid-Pulse Detector. Filed Mar. 1, 1976. PC $3.50/MF $3.00.

Patent application 670,281. Integrated Cooling and Breathing System. Filed Mar. 25, 1976. PC $3.50/MF $3.00.

Patent application 672,107. Carrier-Compatible Chirp-Z Transform Device. Filed Mar. 31, 1976. PC $4.00/MF $3.00.

Patent application 672,579. In-Situ Lapping Apparatus for Gate Valves. Filed Apr. 1, 1976. PC $3.50/MF $3.00.

Patent application 679,629. Amplifier for Fiber Optics Application. Filed Apr. 23, 1976. PC $3.50/MF $3.00.

Patent 3,808,833. Compact Transpiration Cooling System. Filed Apr. 3, 1973. Patented May 7, 1974. Not available NTIS.

Patent 3,916,262. Low Voltage Bus-Operated Overvoltage Protection System. Filed July 23, 1974. Patented Oct. 28, 1975. Not available NTIS.

Patent 3,939,480. Level and Cross-Level Stabilization Technique for Search Radar Antennas. Filed Sept. 17, 1974. Patented Feb. 17, 1976. Not available NTIS.

Patent 3,940,443. Fuel-Air Explosive Bomblet. Filed July 14, 1965. Patented Feb. 24, 1976. Not available NTIS.

Patent 3,940,602. Signal Processing Imager Array Using Charge Transfer Concepts. Filed Sept. 23, 1974. Patented Feb. 24, 1976. Not available NTIS.

Patent 3,940,713. Stimulated Brillouin Scattered (SBS) Tuned Laser. Filed Nov. 11, 1974. Patented Feb. 24, 1976. Not available NTIS.

Patent 3,941,354. Anti Two-Blocking Device. Filed Feb. 25, 1975. Patented Mar. 2, 1976. Not available NTIS.

Patent 3,941,482. Method of Testing Alkali Halide Crystals With Anisotropic Centers. Filed Feb. 25, 1975. Patented Mar. 2, 1976. Not available NTIS.

Patent 3,942,444. Variable Energy Explosive Driver. Filed Sept. 3, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,942,890. Secure Active Sensor. Filed Mar. 21, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,196. Alkoxy Derivatives of the Adduct From Phosphorus Oxychloride and Hexamethylphosphoramide. Filed June 19, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,197. Alkoxy Derivatives of the Adduct From Phosphorous Pentachloride and Hexamethylphosphoramide. Filed June 19, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,457. Optical Pulse Compression and Shaping System. Filed Oct. 16, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,465. Dual Field Excitation for a Carbon Dioxide Laser. Filed Mar. 21, 1974. Patented Mar. 9, 1976. Not available NTIS.

Patent 3,943,708. Two Area Rocket Nozzle. Filed Nov. 26, 1973. Patented Mar. 16, 1976. Not available NTIS.

Patent 3,944,820. High Speed Optical Matrix Multiplier System. Filed May 12, 1975. Patented Mar. 16, 1976. Not available NTIS.

Patent 3,945,716. Rotatable Head Up Display With Coordinate Reversal Correctives. Filed Dec. 20, 1974. Patented Mar. 23, 1976. Not available NTIS.

Patent 3,947,706. Voltage and Temperature Compensated Linear Rectifier. Filed Apr. 30, 1975. Patented Mar. 30, 1976. Not available NTIS.

Patent 3,949,605. Acoustic Current/Flow Measuring System. Filed July 2, 1974. Patented Apr. 13, 1976. Not available NTIS.

Patent 3,950,462. Method for Making a Resilient Storage Insert. Filed June 19, 1975. Patented Apr. 13, 1976. Not available NTIS.

Patent 3,950,703. Microcircuit Reverse-Phased Hybrid Ring Mixer. Filed Feb. 3, 1975. Patented Apr. 13, 1976. Not available NTIS.

Patent 3,950,704. Video Retimer System. Filed Sept. 12, 1974. Patented Apr. 13, 1976. Not available NTIS.

Patent 3,951,072. Propellant Grain. Filed Sept. 12, 1968. Patented Apr. 20, 1976. Not available NTIS.

Patent 3,951,515. Fiber Optic Hull Penetrator With High Channel Density. Filed June 20, 1975. Patented Apr. 20, 1976. Not available NTIS.

Patent 3,952,664. Rocket Nozzle Multi Function. Filed June 10, 1974. Patented Apr. 27, 1976. Not available NTIS.

Patent 3,954,063. Novel Inhibitor System for Double-Base Propellant. Filed Dec. 9, 1974. Patented May 4, 1976. Not available NTIS.

Patent 3,958,194. Frequency-Sensitive Attenuator. Filed Jan. 3, 1975. Patented May 18, 1976. Not available NTIS.

Patent 3,959,671. High Current Pulser Circuit. Filed June 20, 1975. Patented May 25, 1976. Not available NTIS.

Patent 3,959,785. Radiation Hardened Plated Wire for Memory. Filed Jan. 23, 1975. Patented May 25, 1976. Not available NTIS.

NATIONAL AERONAUTICS AND SPACE ADMINISTRATION
Assistant General Counsel for Patent Matters NASA—
Code GP-2, Washington, D.C. 20546

Patent application 616,528. Bearing Material. Filed Sept. 25, 1975. PC $4.00/MF $3.00.

Patent application 623,156. Magnetic Heading References. Filed Oct. 16, 1975. PC $3.50/MF $3.00.

Patent application 636,193. Method and Means for Testing a Glancing-Incidence Mirror Syatem. Filed Nov. 10, 1975. PC $3.50/MF $3.00.

Patent application 666,992. Aldehyde-Containing Urea-Absorbing Polysaccharides. Filed Mar. 15, 1976. PC $3.50/MF $3.00.

Patent application 674,194. Granhite Reinforced Bone Cement. Filed 1976. PC $3.50/MF $3.00.

Patent application 674,700. Oil and Fat Absorbing Polymers. Filed Apr. 7, 1976. PC $3.50/MF $3.00.

Patent application 676,351. Photoelectron Spectrometer With Means for Stabilizing Sample Surface Potential. Filed Apr. 9, 1976. PC $3.50/MF $3.00.

Patent application 677,351. Direct Reading Inductance Meter. Filed Apr. 15, 1976. PC $3.50/MF $3.00.

Patent application 680,939. Portable, Linear-Focused Solar Thermal Energy Collecting System. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 681,096. A Solar Energy Collection System. Filed Apr. 28, 1976. PC $3.50/MF $3.00.

Patent application 684,809. Method and Apparatus for Automatic Load Sharing Among Paralleled Converters. Filed May 10, 1976. PC $3.50/MF $3.00.

Patent application 688,852. RF Beam Center Location Method and Apparatus for Power Transmission System. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 688,853. Method of Inhibiting Maillard Reaction Browning in Food Products. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 688,854. Regenerable Device for Scrubbing Breathable Air of CO_2 and Moisture Without Special Heat Exchanger Equipment. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 688,855. Regenerable Device for Scrubbing Breathable Air of CO_2 and Moisture Without Special Heat Exchanger Equipment. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 688,856. A Condition Sensor System and Method. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 688,879. Extreme Temperature Thermal Control Coating. Filed May 21, 1976. PC $3.50/MF $3.00.

Patent application 690,816. Fluid Valve Assembly. Filed May 27, 1976. PC $3.50/MF $3.00.

Patent application 691,256. Real Time Reflectometer. Filed May 28, 1976. PC $3.50/MF $3.00.

Patent application 692,414. Unbalanced Quadriphase Demodulator. Filed June 3, 1976. PC $3.50/MF $3.00.

Patent application 693,074. Improved Low Cost Substrates for Polycrystalline Solar Cells. Filed June 4, 1976. PC $4.00/MF $3.00.

Patent application 694,402. Schlieren System Employing Antiparallel Reflector in the Forward Direction. Filed June 9, 1976. PC $3.50/MF $3.00.

Patent application 694,406. Method of Post-Process Intensification of Images on Photographic Films and Plates. Filed June 9, 1976. PC $3.50/MF $3.00.

Patent application 696,989. Method of Preparing Zinc Orthotitanate Pigment. Filed June 17, 1976. PC $3.50/MF $3.00.

Patent application 698,646. Honeycomb-Laminate Composite Structure. Filed June 22, 1976. PC $4.00/MF $3.00.

Patent application 699,012. Field Effect Transistor and Method of Construction Thereof. Filed June 23, 1976. PC $3.50/MF $3.00.

Patent application 701,448. An Artificial Leg Employing a Mechanical Energy Storage Device for Hip Disarticulation. Filed June 30, 1976. PC $3.50/MF $3.00.

Patent 3,739,646. Failure Detection and Control Means for Improved Drift Performance of a Gimballed Platform System. Patented June 19, 1973. Not available NTIS.

U.S. DEPARTMENT OF THE AIR FORCE
AF/JACP, Washington, D.C. 20314

Patent 3,970,373. Mirror Steering System. Filed Feb. 6, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,785. Tone Count Audiometric Computer. Filed May 13, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,919. Regulating Digital Power Supply. Filed June 19, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,943. Analog-to-Pulse Integrating Converter. Filed Mar. 27, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,961. Thermionic Cathode Transverse-Discharge Gas Laser Tube. Filed May 9, 1975. Patented July 20, 1976. Not available NTIS.

Patent 3,970,967. Controllable Ultrafast Light Shutter. Filed Oct. 22, 1974. Patented July 20, 1976. Not available NTIS.

Patent 3,970,973. Impedance Standard Apparatus. Filed Sept. 25, 1974. Patented July 20, 1976. Not available NTIS.

Patent 3,975,624. Two's Complement Subtracting System. Filed May 19, 1975. Patented Aug. 17, 1976. Not available NTIS.

Patent 3,975,625. Electronic Coordinate Transformation Using Multiplier Circuits. Filed Jan. 16, 1975. Patented Aug. 17, 1976. Not available NTIS.

Patent 3,975,676. Plural Electrode System for Determining the Electrical Parameters of Large Samples of Materials in Situ. Filed Mar. 29, 1974. Patented Aug. 17, 1976. Not available NTIS.
